THE

JOURNAL OF HORTICULTURE,

COTTAGE GARDENER,

AND

HOME FARMER.

A CHRONICLE OF COUNTRY PURSUITS AND COUNTRY LIFE, INCLUDING BEE-KEEPING.

CONDUCTED BY

ROBERT HOGG, LL.D., F.L.S.

Established

in 1848.

VOLUME XXV. THIRD SERIES.

JULY — DECEMBER, 1892.

LONDON :

PUBLISHED FOR THE PROPRIETOR, 171, FLEET STREET.

LONDON :
PRINTED AT THE JOURNAL OF HORTICULTURE OFFICE,
171, FLEET STREET.

TO OUR READERS.

At the close of another Half-yearly Volume our first duty and pleasure is to record, gratefully, the happy circumstance that all our esteemed coadjutors, the members of our staff, are still spared to impart, as they so well can, sound lessons in Gardening in its various aspects.

Some of them have their "locks silvered by past years," and are happy in adding to their ripeness in experience an almost blithsome lucidity in expression, which makes their writings, as a correspondent expresses, "ever fresh and free."

Others add to the comparative buoyancy of youth, and its sanguine utterance, sober thought and logical acumen that render their productions acceptable and suggestive.

Still more—and we are pleased to say more than ever—of our readers, both amateurs and gardeners, have become instructors by the contribution of articles at once creditable to themselves, useful to others, and generally appreciated.

In the Volume to which the accompanying index refers will be found the first Essays for which silver medals have been granted, and we desire to tender to the writers of them our best congratulations. While recognising the cultural ability displayed by men who win prizes at exhibitions, we think that not less honour is due for skill in literary productions. We have other Essays in hand, and with the object of securing the best information on specified subjects, imparted in commendable literary guise, it is possible that the scope of some competitions will be enlarged. These medals will afford tangible evidence of horticultural acquirements and intelligence by their possessors.

Looking back over the past as we do thankfully, we look forward hopefully, confidently, that the high claims of Horticulture to national respect will be more and more recognised—sure as we are that the ancient art will lead the way in the development of the soil's resources—the root of all prosperity, for the origin of wealth—food—is to be traced to the soil.

In this development the JOURNAL OF HORTICULTURE will have no mean share, for it has as willing supporters—helpers and workers in the worthy effort—the ablest and best exponents of gardening, the foremost cultivators of, and readiest writers on, flowers, fruit, and vegetables in the world.

To all—experts and probationers, amateurs and gardeners, writers and readers, we tender the hand of friendship—friends in a common and good cause—and wish to each and all, in no perfunctory manner, but in the fullest sense that the words convey

A HAPPY NEW YEAR.

INDEX.

- ABELIA RUPESTRIS, 417
 Acacia platyptera, 434
 Acanthorhiza aculeata, Wendl. 527
 Acidanthera bicolor, 440
 Adiantums, cuneatum for cutting, 203; farleyense, 456, 478, 503, 525
 Agapanthus umbellatus, 323, 333; alba, 416; albus, 438, 459
 Agapetes huxifolia, 335
 Ageratums, propagating, 203
 Aglaonema costatum, 149
 Air, town, impurities of, 262
 Allamandas, supporting, 43; resting, 339; treatment of, 385
 Allerton Tower, 243
 Alexandra Park and Palace, 566
 Allotments, at Cardiff, 209; suburban, 307
 Alternantheras, propagating, 203
 Amaryllis, 471
 Amasonia punicea, 351
 American garden implements, 469
 America, the national flower of, 458
 Ancient Society of York Florists' annual dinner, 567
 Anemones, coronaria, 25; japonica, 823; japonica elegans, 397
 Angustas and M. Linden, 93
 Annuals *versus* bedding plants, 122; when they are not annuals, 281
 Anomatheca cruenta, 381
 Anticyclones in the southern hemisphere moving, 567
 Antirrhinums, raising plants, 111; for heading, 488, 505
 Aotus villosa, 289
 Aphides, the migration of, 283
 Apple scab and fungicides, 9
 Apple trees, cankered, 181
 Apples—red spider on, 66; stealing and its sequel, 191; Barchard's Seedling, 214; Keswick Codlin, 50, 257, 287, 373; Irish Peach, 238; at Chiswick, 238; Lady Sudeley, 337; Warner's King and D. T. Fish, 257; Frogmore Prolific, 257; in the north, 283; Emperor Alexander, 287; St Edmund's Pippin, 237; Bess Pool, 287; Cox's Orange Pippin, 287; Annie Elizabeth, 287; Lord Grosvenor, 287; King Harry, 287, 310; Lady Sudeley, 287; at Beverley, 287; Irish Peach, 287; discussion on varieties, pruning, 302; Rivers' Codlin, 310; Royal Jubilee, 324; Hambleton Denx Ans, 324; Mère de Ménage, 324; Bramley's Seedling, 325; Beauty of Hants, 325, 344, 378, 501; Cockpit, 325; Chatley's Kernel, 325; Peasgood's Nonesuch, 325; American Mother, 325; Baumann Red Reinette, 325; for localities, 325; Waltham Abbey Seedling, 344, 412, 500; varieties for clay soils, 344; Cellini, 345, 412, 501; Pott's Seedling, 345; Banman's Red Reinette, 345; Golden Spire, 345; gathering, for keeping, 364; at Chiswick, 369; The Professor Cawley; influence of soil, 372; Lord Grosvenor, 372; Emperor Alexander, 372; Five Crown or London Pippin, 372; Nelson Codlin, 373, 412; King of the Pippins, 373; Cox's Pomona, 373, 438; Warner's King, 373; on light soil, 373; colour in Apples, 373; storing, 386; Cockle's Pippin, 412; Duchess of Oldenburg, 412; Lord Suffield, 412; Unctuous, 412; Mank's Codlin, 434; Hanwell Souring, 434; Tyler's Kernel, 434; Harvey's Wiltshire Defiance, 448; for wet land, 451; French in London, 458; in Belgium, 458; importation of, 458; Nova Scotian, 459; prices of, 478; pruning, 492; Cobham, 495; Northern Spy, 509;
 APPLES—Continued
 nectuous, 500; Blenheim Orange, 500; names of, 500; Hollandbury, 500; at the Hereford Show, 500; inferior, 500; a plethora of varieties, 500, 533; the Fruiterers' Company Show, 500; selection of, 500; proposed methods of education, 561; prices and quality of, 592, 530, 542; varieties, and how to grow them, 522; large, 528; Baldwin, origin of, 526; the Coham, 538; imported, 548; sulphate of iron for, 573
 Apples and Pears, early, gathering, 156; season, 158; root-pruning, 573
 Apricots and Plums, Conference on at Chiswick, 183
 Apricots, cause of branches dying, 262; the successful management of, 275; at Maidstone, 374; failing under glass, 490
 Araucaria excelsa, 471; imbricata, 548
 Arboricultural Society, English, excursion of, 189
 Ardisia crenulata, 79
 Aristolochia gigas, 79; and A. g. Sturtevantii, 353
 Arsenic as an insecticide, 53
 Artichoke, Globe, 453
 Artificially coloured flowers, 526
 Arums, yellow, 7, 31, 122, 526, 550
 Ash, Weeping, at Benham Park, 39
 Asparagus—staking, 43; supporting the tops, 100; A. plumosus, 43; common, for pot culture, 120; deflexus, 192; fruiting, 237; bed-manning, 384; autumn treatment of, 384; forcing, for market, 472; forcing, 493
 Aster diplostaphioides, 79, 313
 Asters, for indoor decoration, 216; novel-belgi Lady Trevelyan, 232; Amellus be-sarahicus, 283; annual, 283; Victoria, 308; Mr. Dewar's lecture on perennial, 311; Daniel's Dwarf Perfection, 327
 Aucubas, Croton, 375; soil from, 429
 Australian fruit, 438
 Aquilegia glandulosa, culture of, 67, 141
 Aquatics for a small fountain basin in a conservatory, 572
 Azaleas, cleansing and housing, 249; moills, 411; imported, 569
 BAILLIE, PRESENTATION TO Mr. W. M., 100
 Balsams at Chiswick, 55
 Bamboos at Kew, 79
 Bank holiday, spending, 93
 Banks and slopes, planting, 570
 Bananas in England, 458
 Battersea Park, 240
 Bauhinia grandiflora, 536
 Beans, late, 43; at Chiswick, 194; blue-podded, 239; sowing French, 293; long runner, 327; kidney, for winter, 427
 Bedding plants, summer, 537
 Beds and borders, effective arrangement of, 257; winter Cherry in, 563
 Beetle, the Mustard, 459
 Bees—Punics, changing, hives 20; notes on, 44, 66, 89, 249; queens by post, 44; Punics, 67, 153, 226, 494, 515, 558; swarming and supering, 67; bees by post, 89; old ideas and new notions, 90, 133; fertile workers, 111, 180; faulty comb foundation, 133; feeders, 133; swarming after drones are killed, 134; superiority of Punics, 134; what others think, 134; utility of fertile workers, 134; transferring, 134; the honey season, 157;
 BEES—Continued
 notes on swarming, 157; plurality of queens, 153; the Heather 180; voles, 180; producing better varieties, 180; superiority of Lanarkshire hives and Punic bees, 233; driving and transferring bees to frame hives, 203; apicultural items, 204; at the Heather, 225; number to a pound, 226; a brief review of the season, 249; apicultural items, 249; the Punic controversy, 250; swarms, 271; feeding swarms, 271; non-swarmers, 272; preserving queens, 272; winter eke, 272; home from the Heather, 293; monopoly, 293; what variety is best, 294; Carniolan, 294; notes on, 364, 385, 408; drones, Punics, feeding, 317; bees, 340; feeding, 340, 408; preparing hives for winter, 340; dysentery, 340; how to make hives, 340; a handharrow, 340; swarm catchers, 340; preparing for winter, 364; wintering bees, 364; winter preservation of, 385; strong hives, 385; introducing a Carniolan queen, 408; winter feeding, 450; blue titmice, 450; management of hives for early work, 450; queens, 471; strong hives, 472; brood combs, 472; hivers, 472; Punics dying, 494; honey gatherers, 494; average yield of honey, 494; notes, 515; gardeners and bees, feeding bees in winter, methods of feeding, a cheap feeder, fountains, the apiary, 538; breeding, 538; space over bees, 558; brood drawing, 558; a fertile and prolific queen, 558; bees and Stonecrop, 558; coloured combs, 572; testimony, 572; effect of flowers on supers, 572; study of bees, 572
 Beet, storing, 384
 Begonias—Duchess of Edinburgh and Crimson Gem, 7; Vernon, 8; progress in, 31; bedding, 32; birds attacking, 78; at Bexley, 143; conference at Chiswick, 166; Marie Louise, 195; propagating tuberous, 202; at Forest Hill, 264; at Yeovil, 308; winter flowering, 339; Tuberous, 407; foliage, 493
 Benefit and Provident Society, United Horticultural, 122
 Benevolent Institution, Gardeners' (Royal), 122
 Berberis Thunbergii, 417
 Berners, Rev. Hugh A., portrait of, 555
 Berry-bearing shrubs, 526
 Bilherries and Cranberries, 205
 Birds, insect-eating, 527
 Black knot on fruit trees, 101
 Black Rice, 109
 Blue tit and fruit buds, 487, 525, 527
 Books, review of, *Land: Its Attractions and Riches*, 141; *Fruit Culture*, 242; *Chemical Technology*, 312; *Agricultural Entomology*, 388; *A Book of Choice Ferns*, 552
 Bones, mistake in dissolving, 558
 Bordeaux mixture *versus* carbonate of copper in ammonia, 45
 Border, a sub-tropical, 480
 Botanic Society (Royal), anniversary meeting, 148; meetings for 1893, 515, 528
 Bougainvillea glabra, 339, 374
 Bouillie bordelaise, cause of failure, 108
 Bourne-mouth Gardeners' Improvement Association, 261
 Bouquet di qualified, 135
 Bonvardias, as bedding plants, 167; culture of, 375; Purity, 397
 Box edging, cutting, 538
 Brighton and Hove Horticultural Society, 527
 Brighton and Sussex New Horticultural and Mutual Improvement Society, 53
 Brighton societies, 81
 Broccoli, Michaclmas White, 234; autumn, 450
 Brussels Sprouts, 56
 Bulbs, culture at home, 24; spring flowering, 339; plunging potted, 428; in open border, stimulant for, 472; transplanting, 537
 Bulbophyllum harvigerum, 98
 Bullen, Mr. R., death of, 351
 Bullfinches damaging fruit trees, 477
 Bulrushes casting their fluff, 234
 CABBAGES, SOWING FOR spring, 43; Ellam's Early, 79; for spring, 133, 293; spring *versus* autumn planting, 259
 Cacti fruiting, crossed, 91
 Cactus, Night-blooming, at Swanley, 32
 Calanthe Veitchii, 73
 Calceolarias, shrubby, 339; pinnata, 331; bedding, 429
 Calcutta Botanic Garden, 284
 Caledonian (Royal) Horticultural Society, shows for 1893, 548; presentation to Mr. P. Neill Fraser, 567
 Californian orchards, yield of, 7
 Callas, Pantiandi and Elliottiana, 7, 31; the yellow, 122; Little Gem, 483; nilotica (?) and others, 493; yellow-flowered, 526, 550
 Calopogon pulchellus, 51
 Camellias, cleansing, 219
 Canker in fruit trees, 561
 Cannas, dwarf, 55; new dwarf, 129; a new, 374
 Carbonate of copper, precipitated, 409
 Cardiff Horticultural Society, 519
 Carnation and Picotee Society, the Midland Counties, 549
 Carnations—common, 9, 56; propagating, 19; Miss Jolliffe, 32, 471; attacked by hylemyia grubs, 32; layering, 50; Madame de Warocque and Miss Nina Balfour, 100; the Manual, 142; Duchess of Portland, 142; at Slough, 142; propagating Souvenir de la Malmaison, 157; Lady Wantage, 167; prize in a cottage garden, 168; as annuals, 261; Winter Cheer, 352; The Margaret, 309, 351, 483; winter blooming, 418; maggot, the, 489; fungus on, 494
 Carnations and Picotees, the new German varieties, 280; as annuals, 282
 Carnations and Pinks, Margaret, 391
 Carnations and Streptocarpus at Chelsea, 74
 Carrots, storing, 384; hard, 559
 Carshalton Show and Conference, 94

Bunnard & Co.'s nurseries, 347; fungi diseases on, 575; planting, 407; removing, 407; watering and mulching, 407; advantage of early planting, 407; trained, at Messrs. Veitch's, 414; extension versus restriction in, 434; planting wall, 449; trees, manuring and renovating, 536; compost for, 537; canker on, 564.

Fruiterers' Company, the, 352; and the Lord Mayor, 373.

Fuchsias, on arches, 8; fulgens, 215; storing, 368; cultivation of, 512.

Fungus, a new luminous, 548.

GALTONIA CANDIDANS, 330.

Garden, a quaint, 235.

Gardeners' Association, lectures, 376.

Gardeners, boy, 549.

Gardeners' examinations, 416.

Gardeners' Orphan Fund, concert of, 458; benefit at the Olympia, 482.

Gardeners' Royal Benevolent Institution, annual dinner, 439; financial results, 457; and young men, 482, 511; general meeting, 504, 559.

Gardenias, cleansing, 203.

Gardening appointments, 31, 192.

Gardening, education in, at Edinburgh, 284; education in, 316, 371, 391, 493, 528.

Garden literature, stray leaves of, 321.

Garden and garden management, notes on, 489.

Garlic and Shallots lifting, 133.

Garnett, Mr. T., 317.

Gas, heating with, 172.

Gas lime, use of, on land for Potatoes, 386.

Gentiana acaulis, 2.

Ghent International Exhibition, 433.

Gladiolus Colvillei, The Bride, 471.

Glass bricks for greenhouses, 526.

Gooseberries, bottling green, 68.

Goring Hall, 510.

Gourds, 341.

Graes, scalding and shanking of, 24; notes on, 52; cracking, 67; unsatisfactory, 68; growing, quick, 75; eaten by grubs, 91; scalding, 112; Muscat, failing, 135; fine Canon Hall Muscat, 147; sixty tons from the Hampton Court Vine, 143; packing, 158; Gros Maroc and Gros Colman, 158; growing in ninety days, 234, 259; growing for profit, 265; not colouring, 273; good Muscat Hamburgh, 282; White Gros Colman and Charles Vibert, 311; management of late, 316; Muscats, without heat, 328; a heavy crop, 329; house of ripe, 332; late, 332; at Waterlow Park, 397; thin-skinned, 427; the heaviest bunch of, 429; coated with mildew, 451; faulty, 516; at Hill Grove, Kidderminster, 536; early Muscat, 538; the largest bunch, 573.

Grape Vines and their cultivation, 335.

Greenhouse, double glazed, 516; modern, 559.

Grouping plants effectively, 102.

Gypsum with manure for Mushroom beds, mixing, 498.

HAILSTORM IN WESTMORELAND, 7.

Hampton Court, summer bedding at, 121.

Hampton Horticultural Co., Ltd., 192.

Hardy flowers, notes, 71; showing and judging, 120, 188, 497, 520, 546.

Harkstead, Suffolk, 555.

Haseley Manor, 173.

Hawkesley, Dr., death of, 526.

Heat, Mr. G. W., 421.

Heating, forcing houses, 91; steam versus hot water, 305.

Hedychium coronarium, 234.

Helenium autumnale striatum, 267, 371.

Helianthus Soleil d'Or, 232.

Heliotrope, propagating, 203.

Herbaceous flowers, judging, 120, 172, 183, 210, 234, 278, 433; plants, hardy perennials, 390.

Hereford Fruit Show, 490.

Herefordshire Fruit and Chrysanthemum Society Show in 1893, 548.

Heuchera sanguinea, 2.

Hoeing versus mulching, 26, 73.

Hollyhocks, notes on, 193.

Honey and flowers, 168.

Hops, early, 146; the crop, 260.

Horticultural Club, dinner at, 548.

Horticultural (International) Exhibition, presentation to Mr. Milner, list of awards to season exhibitors, October Show, 314.

Horticultural progress, sixty years of, 162, 326.

Horticultural Society (Royal), Committee meetings, 36, 76, 123, 163, 211, 268, 310, 359, 395, 437, 534; certificates, 126, 165, 212, 269, 311, 361, 395, 437, 535; Conference on Begonias, Ferns, Apricots and Plums at Chiswick, 163; meetings of, in 1893, 396, 525; Scientific Committee, 393, 415, 460, 554; and its competitions, 543.

Horticultural Society of France, 527.

Horticulture in Parliament, 31; technical education in, 79, 417; examinations in, 458; in Colorado, 508; scholarships in 548; in Ireland, 548.

Hove Flower Show, 307.

Hoya imperialis, 484.

Huyton and Roby Horticultural Society, 169.

Hyacinths, potting Roman, 157; notes on, 254, 279.

Hyde Park, 120.

Hydrangeas and Gladioli, 215.

Hymenanthera crassifolia, 311.

IMANTOPHYLLUMS, 471.

Impatiens, notes on, 119; *Jerdoniae*, 226.

India, English fruit in, 450.

Indian corn, 167.

Indianhuber, flowers of, 216.

Industry—a new, 481, 455; an old, 453.

Insects, of the flower garden, 91, 256, 569; coloured plates of injurious, 499.

Ireland, notes from, 479.

Iresines, propagating, 203; destroying with oil, 214.

Iris, *stylosa*, culture of, 67, 140; *iberica* and *I. Susiana*, 432; *Danfordia*, 501.

International Horticultural Exhibition, 334; presentation to Mr. Milner, list of season exhibitors, October show, 314.

Ixias, notes on, 282.

Ixionia montanum, 533.

Ixoras, shortening, 43.

JAMESIA AMERICANA, 511.

Japanese gardeners, 124, 167.

Jasminum nudiflorum, 526.

Justicia flavicomma, 339.

KALOSANTHES AFTER FLOWERING, 157.

Kew, changes in the staff, 123; Gardens, earlier opening of, 238, 484, 459; appointments, 527; the "Kew Bulletin," 527; Guild of Kew gardeners, 528.

Kitchen garden calendar, 42, 83, 133, 215, 293, 384, 427, 450, 493, 557, 571.

Kniphofias, 323.

LABURNUMS, CHILDREN POISONED BY SEEDS, 147.

Lachenalia in baskets, 307.

Laelias, Ferrini, 371; *monophylla*, 117; *pumila*, 141; *crispa* and *var. superba*, 259; *anceps Oweiana*, 568.

Laelio-Cattleya Ingrami, 141; *Arnoldiana*, 147.

Lancing Manor, 510.

Land, waste, profitable use of, 209.

Lantana, a beautiful, 123.

Larus, expelling worms, 429.

Lettuces, Early Paris Market, 8; for autumn and winter, 118; artificial manure for, 48.

Lilies, Bermuda, 527.

Liliums—*candidum*, failure and disease of, 140; potting, 157; *tigrinum*, 167; *Harrisii*, 317, 471; *lancifolium*, 363; *Harrisii* in pots, 557; *candidum*, 557.

Lily of the Valley, 363; forming a bed of, 539.

Lime, a good dressing of, 418.

Linaris pectorata, 85.

Lithospermum prostratum, 148, 404.

Liverpool Horticultural Association, 549.

Liverpool Notes—Thingwall Hall, 289; Roby Mount, 290; Cleveley, Ailerton, 290; Huyton and Roby Horticultural Society, 290; Horticultural Society, 459; Horticultural Association, 526.

Lani versus turf, 29.

Lobelia, propagating, 8; Maid of Moray, 30, 79; Royal Purple, 78; *Canelei's* Seedling, 93; dwarf bedding, 102; *Mulleri*, 238.

Low, Messrs. Hugh & Sons' nurseries, 486.

A SUPPLY of strong early runners for layering in pots for forcing is out of the question from old plants, the best being furnished by young plants that are planted early after rooting in the preceding year, and these must not be heavily cropped if they are to furnish vigorous runners; in fact, they are better not cropped, yet it is desirable that the runners be only taken from plants that have shown fruit. The small early varieties are not worth growing in pots, for the first consideration in a forced Strawberry is appearance—colour combined with good size and form. Earliness, however, is a matter of vital importance in many cases, for to be anywhere but first is a great disparagement and loss of prestige to the grower who is provided with all necessary conveniences for his work.

As a first early forcing Strawberry Black Prince was at one time the most popular, but it is very liable to mildew, and the fruit when ripe is so small as to compare unfavourably with *La Grosse Sucrée* and *Vicomtesse Héricart de Thury*. These have superseded Black Prince, but neither has the colour indicative of perfect ripeness nor the mellow flavour which some persons consider essential in the earliest Strawberries. John Ruskin is likely to take a leading place as a first early forced Strawberry. It may be described as an improved Black Prince with larger fruit, well grown specimens averaging half an ounce each. *La Grosse Sucrée* is bigger and better than any Strawberry I have grown as a first early, averaging about three-quarters of an ounce per fruit, and its colour is bright and glossy. *Vicomtesse Héricart de Thury* produces more fruit, which is, as a rule, smaller. I have had "king" fruits weighing $1\frac{1}{4}$ oz., but good average early forced fruits of this variety are fine at half an ounce each. *Auguste Nicaise* has bold foliage, also large and handsome fruit, specimens weighing $2\frac{1}{4}$ ozs., and the flavour is decidedly rich and vinous. The colour is red, but more lively than *Noble* and *Duc de Malakoff*. The latter I at one time forced largely, and grew fruits over 2 ozs. in weight; but though good in flavour it was not a favourite on the dessert table. *Noble* is of the same race as *Duc de Malakoff*, having immense fruit. It is a great cropper, and useful for second early forcing, but must not be brought forward in too high a temperature. Similar remarks apply to *Auguste Nicaise*.

For home use and mellow rich flavour no Strawberry surpasses *Sir Harry* as a second early forcing variety. It is much confounded with *Keens' Seedling*, but the fruit is larger, more even in size, has a fine dark glossy colour and rich flavour. *President* (Bothwell Bank) possesses a fine constitution, has large handsome fruit, and is excellent as a second early or midseason forcing variety. Its colour, however, is too light to find favour in the markets, at least salesmen return less money for it than for darker and glossier fruit. Its agreeable flavour, large size, and handsome appearance are much esteemed at dessert. Fine specimens weigh over 2 ozs., and such are very liable to "spot"—a disease peculiar to the richest flavoured Strawberries. *Sir Joseph Paxton* is a fine midseason and late forcing Strawberry, and is then generally free from mildew, but when earlier forced the plants and fruit mildew to a serious extent. The fruit is large, heavy (specimens reach $2\frac{1}{2}$ ozs.), bright darkish red, with a rich glossy appearance, and a whitish somewhat mealy bloom. The quality is good and the fruit travels well. *Sir Charles Napier* forces

well for a middle crop, is handsome, large, bright red, rather scarlet, and crops freely. Perhaps there is no finer looking Strawberry than this; its flavour is sub-acid, yet refreshing to many palates.

For late forcing none surpasses *British Queen*. It is never grown to such perfection as under glass, the large, handsome, light coloured, exquisitely flavoured, thoroughly ripe fruit excelling all other Strawberries; but it is not largely grown for market, as the prices are not remunerative. *Dr. Hogg* is difficult to distinguish from *British Queen* when they are grown together under glass. It has a better constitution, the plants are not so liable to become "blind," the fruit is large, handsome, though light coloured, deliciously sweet and delightfully piquant. Many fine baskets of *Sir Joseph Paxton* are named *Dr. Hogg* in fruiterers' windows. *Cockscomb* is large—in the "king" fruits enormous—and brighter in colour than *British Queen* and *Dr. Hogg*. It is evidently of the same race, and is richly flavoured. Those three are the best late forcing Strawberries to grow where nothing short of the highest quality with noble appearance will satisfy. *Waterloo* has the rich glossy crimson colour which is esteemed in the markets, and its large cockscomb-shaped fruits contrast effectively with *British Queen* for home desserts. Those are the varieties of Strawberries I have found most pleasant to the eyes and best satisfying to all tastes when forced.

The best plants to supply the largest fruit in the fullest crop are secured by layering the first runners either into small pots, and when they are rooted well detaching and shifting into the fruiting pots; or layering at once into the pots the plants are to be fruited in. Both plans are good; but I prefer the first on the score of economy in labour, especially in transport, as it is much easier to move 3-inch than 6-inch pots filled with soil. The 3-inch pots should be placed in a continuous line between every other two rows of plants, filling them to within half an inch of the rim with rather rough turfy loam rammed hard, half plunging the pots, and making a slight indentation in the centre of each for the plantlet. Secure it with a galvanised wire hairpin-like peg, and suppress all further runner growth. The pots must be kept properly watered to insure the speedy emission of roots by the runners, and as soon as the pots are filled with roots, and before they become much matted around the sides, detach the runners from the parents, and place the young plants in a shady place for a few days preparatory to shifting them into the fruiting pots. These should be 5-inch for early forcing, 6 inches for succession, while 7-inch may be employed for plants that may not be required for starting before February or March for affording large crops of the largest fruits in due season.

The fruiting pots must be clean, have a large crock in each, about three or four of lesser size above them, and over these some finer pieces so as to make about an inch in depth, or a little more. Turfy loam, rather strong, should form the staple of the compost, being only laid up sufficiently long to destroy the herbage. Tear or chop it up and add a quart each of steamed bonemeal and wood ashes to every bushel of loam, with about a pint of soot, thoroughly incorporating them. The compost should be moderately dry when used, for if too wet it will shrink after use and leave the sides of the pot; the rooting medium is not good, nor can water be well supplied. Place the rougher portions of the compost at the bottom and then pot firmly. The base of the crown should be about half an inch below the rim of the pot. Stand the pots on a hard base, impervious to or disliked by worms, in an open sunny situation, with sufficient space between the plants to allow for the full exposure of the foliage. Avoid positions exposed to winds, as these injure the leaves by rubbing against the pots. Supply water as required, and sprinkle the foliage daily for a few days after potting. With the roots working freely in the fresh soil copious supplies of water will be needed, and the

foliage should never be allowed to flag. Remove all runners as they appear, and keep clear of weeds, then may sturdy fruitful plants be expected capable of producing first-class Strawberries.—G. A.

HARDY FLOWER NOTES.

HEUCHERA SANGUINEA.

ONE of the finest of our rock or border plants at present is *Heuchera sanguinea*, which was illustrated in the *Journal* of 9th June (page 437). With the illustration appeared a most interesting notice of the plant by "Daisy," and if I must differ from that writer in his recommendation of annual division, it must be only in part, as the truth is we can lay down no hard and fast rule as regards division or non-division of hardy plants which can be applied to all gardens alike. In some gardens *H. sanguinea* may be divided and transplanted with excellent results, and in others this treatment may be unavailing. This I have seen amply tested, and I know full well that this mode is a most unsuitable one in a garden such as mine, where the *Heuchera* flowers freely if it receives an ample supply of water in early spring and summer. It is well, however, to know that with some success may be achieved by different treatment, and where the plant flowers even only moderately well it is well worth all the pains which may be bestowed upon it.

It is pleasant to know that at Kew progress seems to have been made with this plant, and I have no doubt if some enthusiast would only take up the improvement of the *Heuchera* that a rich reward—not perhaps in coin of the realm—would await him, and our gardens would be vastly enriched. Advocate as I am of raising hardy flowers from seed, I cannot but recognise that by this mode inferior forms are produced, and the exigencies of trade prevent most trade growers from eliminating the inferior plants. Here, however, is the field for the amateur, and I fancy he will not long leave it untilled. There is, by the way, what is said to be a superior variety of *H. sanguinea* offered by some of the trade under the name of *H. s. superba*. This should not remain at a high price for any length of time, as few plants are more easily increased.

DIVIDING GENTIANA ACAULIS.

Ere I quit the connection, a word or two on the subject of *Gentiana acaulis* occurs to me. I held for many years the orthodox faith that this delightful flower should be disturbed as seldom as possible, and when disturbed it should be removed in as large plants as possible. Fancy, then, my horror when on going into the garden of an enthusiastic lady florist I observed an array of single crowns of the *Gentianella*. On making inquiry why this was done, I learned that the friend from whom my friend had received the plant had said it would flower more freely if thus divided and planted. As was to be expected I promptly expressed dissent, but on entering the same garden the following spring I was astonished to see a delightful bloom upon the divided *Gentian*. Since that time I have become more heterodox in my treatment of flowers, and where I find *G. acaulis* is not amenable to the various soils recommended by ordinary practitioners, I do not scruple to suggest tearing the plants to pieces. Thus do our cherished prejudices become dissipated by facts—these "stubborn chieftains."

I have begun with poetry and descended into prosaic treatment; I have begun with the intention of reviewing some of *Flora's* battalions as they pass the saluting point, and have been tempted into the by-paths of cultivation. If thus I have gone astray perchance some other day some flowers unnoticed may receive their merited praise, for June has many blossoms in her hand.

POPPIES.

Poppies are brilliant and wave to the breath of the wind. *Papaver umbrosum* found a home here some six or seven years ago, and to all appearance means to remain. The Shirley Poppies arrived soon after their introduction by the Rev. W. Wilks, and spring up everywhere. *P. nudicaule*, the Iceland Poppy, runs riot through the garden, turning up in all sorts of places. It has invaded the borders and rockeries, and finds in mounds of Mossy Saxifrages and other Alpine plants a convenient seeding place. The convenience may be pleasant for the plant, but our patience is sometimes sorely tried when we have to extract tenderly from the bosom of some choice alpine the youthful scion of the sleep-producing race. Then the giant Oriental Poppy, *P. orientale*, known here as the "French" Poppy, has of late striven to emulate the others of its race, and to establish itself in unwelcome places. But, after all, the Poppies are little, if any, worse than many other flowers in this respect, for my garden seems to be a spot where

seedlings love to grow, and the fine Poppy flowers with their "crinkled" petals are very acceptable.

SUN ROSES.

These same "crinkled" petals remind me of the *Helianthemums* or Sun Roses, now brightening the rockeries in early morning and sunny forenoons. Fragile and beautiful are they; true children of Helios, and like their deity are too short a time with us. But as Herrick says, "Old time is still a flying," and we can but glance at those sheets of *Alyssum serpyllifolium* giving in the garden the brilliant gold which its congener *A. saxatile* lavished in the month of May; *Onosma taurica* (the Golden Drop), with its Almond-scented drooping golden ear-drop blossoms and hirsute foliage; *Lithospermum prostratum*, with its dark green foliage and deep blue flowers as if coloured by the ægis of Athena; noble *Pyrethrum*s, with their beautifully cut leaves and Aster-like flowers—some double and massive, others single and light and graceful; a stately yellow Tree Lupin loaded with flower; its cousins, the varieties of *L. polyphyllus*, with spires of crowded blooms; drooping *Columbines*—in former times the emblems of deserted lovers—double Rockets, Sikkim and Japanese Primroses, and many other flowers which are shining around. Ere this appears the lordly *Delphiniums* will have begun to deck themselves with pale or dark or purple-blue, and with their companion flowers coming on in serried ranks we may stand, unwearied, watching as they pass onward these children of the summer, for with their beauty there is no sameness to pall upon us. And thus, though as I write drenching rain and gloomy skies would fain shadow us with gloom, I lay down my pen cheered with looking and thinking and writing of these flowers, which seem sent to give joy to man, and to inspire him with pure and reverent thoughts.—S. ARNOTT.

NOTES ON FIGS.

FIGS are favourite fruits with many, and appear to be increasing in popularity. They are wholesome, luscious, and easily grown in appropriate structures and under suitable management. The second crops on the trees which ripened the first crop in April and May are now swelling freely, and where judiciously thinned fine fruit will soon be forthcoming. This applies to the very early varieties, Tresfer, Early Violet, St. John's, and Angelique, which must be kept dry as soon as ripening commences. Brown Turkey is later, and affords a good succession, being slightly preceded by White Marseilles. If the crop is heavy, the former thinning not having been sufficient, thin the fruit at once, leaving the most forward at the base of the shoots, which will ripen earlier than the others, and so afford more time for the maturing of the wood. Trees in pots required for very early forcing must not carry a heavy second crop, nor be allowed to bear any fruit near the points of the shoots, otherwise they will not produce a full first crop another year.

Early-forced planted out trees should have the young growths ripened, and be resting by the middle of October. They must not be allowed to bear a second crop at the points of the shoots. If the borders were allowed to get dry when the first crop of fruit was ripening, they must be repeatedly watered until the soil is thoroughly moistened down to the drainage, and a mulch applied. Liquid manure and surface dressings will be required by trees having their roots in borders of limited extent, and more frequently than by trees with a larger extent of rooting area, the former about once a week, and the latter every fortnight, always giving thorough supplies, and equal in temperature to the mean of the house. The mulching need not be heavy, a couple of inches sufficing, and it should be damped when the surface becomes dry, not kept constantly wet, or the roots will not work freely, while the growths will be sappy.

Syringe the trees twice daily, except in dull wet weather, then only to keep down insects, and always to allow the foliage to become dry before night. Forcible syringings are only useful against red spider and generally suffice to keep it in check, but if it gains a footing it must be dislodged, and there is no better means than clear water forcibly applied with a syringe or engine. Softsoap, 3 ounces to a gallon of water, may be used, and scale removed from the wood with a brush moistened with the soapy solution, thoroughly cleansing the trees afterwards with clear water. Painting the hot-water pipes, heated to over 170°, with sulphur brought to the consistency of cream with skim milk is an effectual remedy for red spider. The house should be closed, the foliage dry, and the pipes hot for at least an hour after the sulphur is applied. The trees should be forcibly syringed the following day. Remember that the fumes of sulphur will only kill living parasitic animals and fungi; they have no effect whatever on the eggs, therefore it may be necessary to repeat the applications.

Artificial heat is only necessary in cold dull weather, then gentle warmth in the pipes is necessary to maintain a night temperature of 60° to 65°, and 70° to 75° by day. Ventilate early, especially on bright mornings. Figs detest "stewing," yet no other fruit is more benefited by a high temperature from sun heat; therefore keep through the day at 80° to 85°, and close early so as to increase the heat to 90°, or even 95° to 100°, providing plenty of atmospheric moisture, and allow the temperature to fall to 60° or 65°.

When the fruit changes colour afford a circulation of air constantly, and a free movement of the atmosphere by top and bottom ventilation whenever circumstances allow. Reduce the moisture gradually, and keep it from the fruit, which should be exposed to the influence of light and air as much as possible, then the fruit will be wholesome and delicious.

During the swelling of the fruit a mulch of lumpy short manure 2 inches thick attracts the roots, and the manurial elements become assimilated and washed into the soil at each watering. There must not be any lack of water, and trees carrying heavy crops will need liberal supplies of liquid manure. Withhold it, however, from those having a tendency to over-luxuriance. Trees in borders well drained, properly constituted, and of small area, can hardly be overfed; but wide, deep, rich borders produce overgrowth in the trees, abundance of wood, and grand leaves, but no fruit. Lifting and circumscribing the rooting area constitute the only way to transform fruitless into fruitful trees. Syringe the trees twice a day in fine weather, for the last time early in the afternoon. Ventilate early in the morning, so as to avoid scorching and scalds of all sorts by dissipating the moisture deposited during the night before the sun acts powerfully upon the foliage. Early ventilation secures a long day's work, because evaporation begins soon, and elaboration and assimilation go on with the increasing sun. Rest at night, the temperature falling to a safe minimum, insures the certainty of a renewal of the work with unabated vigour.

Trees under wall cases yield fruit abundantly in August and September. Those do best which are confined at the roots to narrow borders of calcareous soil well drained. The structure must be light, and well ventilated. Keep the growths thin; let the sun shine into the axils of the leaves and on the points of the shoots, then the trees will be sturdy and fruitful. Stop side shoots at the fifth leaf where there is not room for extension growth; but do not crowd the trees with spurs, and avoid late pinching. Ventilate early; retain the sun heat by early closing, with plenty of atmospheric moisture, and keep the borders well watered and mulched. Such is the routine followed in summer, which results in a long supply of delicious fruit.—AN OLD GROWER.

SARRACENIAS.

KEW is one of the few gardens in which *Sarracenia* are cultivated with success; there they are grown in a sunny porch adjoining the Orchid house, and they are always a source of considerable interest to visitors on account of the extraordinary structure of their pitcher-like leaves and their supposed insectivorous propensities. They are, however, specially interesting during the months of April and May, when they develop new pitchers and produce their handsome flowers, which in colour, size, and singularity of structure are sufficiently attractive to rank with first-rate greenhouse-flowering plants. A well-grown specimen of *S. Drummondii*, *S. Patersoni*, *S. ornata*, or *S. Stevensi* could not well be overrated as an ornamental greenhouse plant.

How they should be grown does not appear to be generally known; a few notes on their treatment may therefore be useful to readers of the *Journal of Horticulture*. The six true species of *Sarracenia* known to botanists are natives of North America, where they grow only in swamps or marshes. They are semi-aquatic in a wild state. It is important to bear this in mind when the plants come to be treated in the garden, for although they are not easily killed, even by drought, they do very little good unless they are freely and abundantly watered all the year round. They have a short thick rhizomatous stem, not unlike that of the German Iris, and their roots are very fine and soft. In repotting them in March the plants should be shaken or washed clean of all old soil, dead parts cut away, and then repotted in a mixture of equal parts of peat and sphagnum, pressing this firmly about the plants and just burying the stems. They should then be placed in a sunny greenhouse and kept close until the new pitchers push up, watering them well at least once a day. The flower buds will show at the same time, and if the plants are strong enough they may be allowed to carry a few flowers. A profusion of these, however, can only be had at the expense of the pitchers, so that if good pitchers are wanted few flowers should be allowed to develop.

After the pitchers have grown to their full size more air may be given, until by June the house may be kept as cool as an ordinary greenhouse. The plants must not be shaded; plenty of sunlight and warmth, sweet soil, and abundance of water are the most essential points in the successful cultivation of *Sarracenia*s.

The pitchers have an attraction for flies of all kinds, which appear to become intoxicated through taking the secretion on

FIG. 1.—SARRACENIA STEVENSI (reduced).

the lid of the pitcher, and consequently fall into the pitcher, out of which they cannot escape. It often happens that through catching too many flies the pitchers become overgorged, and the putrid mass formed by the dead flies becomes a source of disease, causing the pitchers to decay. To prevent this it is advisable to stuff a little cotton wool in the mouth of the tube low enough down to be out of sight, and yet near enough to the top to enable the flies to escape.

There are numerous hybrid *Sarracenia*s now, and some of them are larger and handsomer, both in pitcher and flower, than the species. The first hybrid was raised by the late Dr. Moore of Glasnevin, who exhibited it in flower for the first time at the International Botanical Congress held in Florence in 1874. It was

obtained by crossing *S. flava* with *S. Drummondii*, and is intermediate between the two. It was afterwards named *S. Moorei*, and it is still grown wherever *Sarracenia*s are in favour. Since Dr. Moore's success others have followed his example, until we have now about thirty named kinds, some of which are distinct, others not. Evidently the breeders have paid attention to the characters of the pitchers only, for they do not even refer to the flowers in their descriptions of their hybrids. Anyone who has seen the flowers when at their best in a good collection of plants knows what their beauty is. I had a large glass full of them this spring taken from plants which had been allowed to carry too many, and an artist friend well acquainted with garden flowers declared that they formed one of the most attractive posies he had ever seen. Of course he did not know what they were. Cream-white, rose, rose and cream, yellow, crimson, and other shades of red are amongst the colours of *Sarracenia* flowers.

One of the best of the hybrids is that here figured, viz., *S. Stevensi*, which was raised at Trentham by Mr. Stevens, from *S. flava* and *S. purpurea*. It was brought into notice in 1874, about the time when Dr. Moore described his first hybrid. The pitchers of *S. Stevensi* are nearly 2 feet high, broadly inflated, with a very large nearly erect "lid," coloured deep green, thickly mottled with deep claret purple. The flowers are over 5 inches across, greenish white except the broad tongue-like falls (petals), which are deep crimson outside and pale yellow inside. The shield-like ovary is pale green. This hybrid is robust in growth, and when well treated the colour of its fine pitchers is very rich. —W. W.

(To be continued.)

CATTELEYA IRICOLOR.

WHEN, a few weeks ago, Messrs. James Veitch & Sons exhibited the hybrid *Cattleya Philo* with the information that it was a cross between *C. iricolor* and *C. Mossiae*, many found themselves in the position of being well acquainted with one parent, but totally unfamiliar with the other. *C. iricolor* was, of course, the unknown one, consequently when exhibited by Baron Schröder at the meeting of May the 19th it excited special interest. It is a very distinct species, being a small-growing form with short flattened pseudobulbs and linear oblong leaves. The spike bore three flowers. The sepals and petals are ivory-coloured, the former being very faintly suffused with rose. The lip is narrow, the apical area pure white, streaked with rosy purple towards the back; the throat and side lobes pale lemon with rosy purple streaks in the interior of the tube, the exterior also being blotched with rosy purple. The plant exhibited is the only one in the country. It was bought at Stevens' rooms by Messrs. Veitch & Sons about twenty years ago. It was a very small plant, and was subsequently divided, one or two pieces going to America and the remaining one to Baron Schröder. Although far from being a showy form it is extremely delicate, pleasing, and distinct, well deserving the first class certificate that was awarded to it. Fig. 3 represents it (see page 15).

INDIAN ORCHIDS.

(Concluded from page 489.)

PHALÆNOPSIS is more a Malayan than an Indian genus, yet there are species occurring within the British area that are well worth the attention of amateurs. Of such are *P. Lowi* from Moulmein, a deciduous species growing on limestone rocks, where the surrounding country is under water during the greater part of the year, and the rainfall is excessive; and *P. Parishii* from the same province, a pretty little species with a most remarkable labellum, also deciduous in its native home, but evergreen under the cooler treatment it receives in the glass houses of Europe. *P. speciosa*, from the Andaman Islands, is a handsome recent addition to the genus, and *P. Manni*, from Assam, is interesting as an outlying species growing at a high elevation, and which is known to the writer to be successfully cultivated in a greenhouse in Lancashire.

There is a general belief that the *Phalænopses* are difficult plants to cultivate successfully, and they have been looked upon as horticultural luxuries to be indulged in by a privileged few. It would be futile to assert that such a belief is groundless in the face of the many failures that have occurred since the first introduction of *Phalænopses* into British gardens, and during the long series of

experimental cultural trials before a method could be hit upon with satisfactory results. The difficulty has doubtless arisen from the impossibility of even approximately imitating in the glass houses of England the conditions under which they grow and thrive in their native home. Nearly all the species are either insular or littoral, and grow within the influence of the sea and land breezes. Thus, *P. amabilis* (the *grandiflora* of gardens) grows high up on trees screened from the sun by a leafy canopy, deluged with rain for more than half the year, scorched by a tropical sun during the dry monsoon, and constantly fanned by the sea breeze. *P. Stuartiana* affixes itself to the branches of trees so close to the sea that in some places it can scarcely fail to be washed by the salt spray during a storm. *P. Sanderiana* lives almost under similar conditions. From amidst such environments these lovely Orchids have been brought to Europe to be grown under the artificial conditions provided for them in glass houses, and their culture has hence been one of the most difficult problems the horticulturist has been called upon to solve. Anyone who sees the *Phalænopses* at Tring Park, The Dell, Burford Lodge, Henham Hall, and other places, will find ample evidence of the progress that has been made in the solution of this cultural problem.

The beautiful group of *Phalænopses*—of which *Schilleriana*, *amabilis*, *Aphrodite*, *Stuartiana*, and *Sanderiana* are the most admired species—has been enlarged from two sources—(1) by the introduction of natural hybrids, of which *leucorhoda* or some of its varieties are now to be found in many collections, but of which intermedia is by far the most interesting, as it has also been produced artificially; (2) and by hybrids raised by hand. Among the latter some very striking results have been obtained, notably that raised by Seden from *amabilis* (*grandiflora* of gardens) and *Luddemanniana*, and which bears his name. The plants raised from this cross have flowered at The Dell, and are justly estimated by the accomplished amateur who owns them as the most remarkable instance of the hybridist's skill yet obtained. The whole group of *Phalænopses*, consisting of the species just named and the hybrids, both natural and artificial derived from them, unquestionably forms one of the most lovely sights obtainable in the modern Orchid house.

I will now glance at *Aerides*. Many of the forms, notably those of the *odoratum* type, offer the double attraction of an elegant inflorescence and a delightful perfume. Moreover, the culture of *Aerides* presents no such difficulties as those encountered in *Phalænopsis*. The routine, as formulated by the most experienced growers, is simple, and such as can be performed by the amateur himself if he has the leisure and inclination, or at least by any gardener of ordinary intelligence. Considerable variety, too, occurs in the genus, and even within the groups into which the various forms naturally fall. For example, besides the typical *odoratum*, which has been cultivated from the beginning of the present century, there is its grand congener *Lawrenceana* with its yellow flowered variety that bears Sander's name, and also the beautiful Java form known as *virens*, all quite distinct as horticultural plants, but scarcely so botanically. Another fine group is represented by *Aerides multiflorum*, the *A. affine* of Lindley, of which perhaps its variety *Lobbi*, with its long, pendulous, branched inflorescence is the most admired, but the rare *Veitchii* is scarcely less so, while the closely allied "Fox Brush" *Aerides* follows near upon them.

The group represented by *Aerides falcatum*, the *Larpenæ* of gardens, has been brought into some prominence of late through importations from Burmah, and includes several handsome forms, as *Houlletianum*, *Leonæ*, and *crassifolium*. *A. crispum* is still recognised as one of the finest of *Aerides*, while in strong contrast to it, and which should not be passed over in silence, is the curious little *A. japonicum*. If we turn to the horticultural journals of twenty to thirty years ago we shall not only find glowing encomiums of the grand specimens of *Aerides* exhibited at the leading horticultural exhibitions of the time, but even woodcut illustrations of some of them. How rarely is a grand specimen of *Aerides* equal to those of our predecessors to be seen at the present day?

Can too much be said in praise of the cultivated *Saccolabiums*, including under that name the beautiful *S. Blumei* and *guttatum*, and the recently introduced *coeleste*, in which we have a really blue Orchid. These must speak for themselves. Let me remark, however, that although known in gardens as *Saccolabiums* they do not botanically conform to the typical species, and they have thence by general consent been removed from the genus. In Veitch's "Orchid Manual" they are described under *Rhynchostylis*. Turning to the true *Saccolabiums*, we find that there are upwards of fifty species, but most of them with small unattractive flowers, and hence it is so few of them are seen in the Orchid houses of Europe; but these few are so striking and handsome that they must at least be named. First, *bellinum*, with its curious bowl-like labellum and unusual combination of colours in

the flowers; then there is the dwarf rose-coloured Hendersonianum from Borneo; and the more robust ampullaceum from the tropical Himalaya; and the scarlet curvifolium from the same region, decidedly the most effective scarlet Indian Orchid, almost rivalling in its showy colour the Mexican Epidendrum vitellinum, the Columbian Ada, and the Brazilian Lælia harpophylla. All these Saccolabiums take up but little room, but there are associated with them the more bulky giganteum from Burmah and violaceum from the Philippines, both very handsome, but which might with equal right be included in Vanda.

The name Vanda is thoroughly Oriental, and is an eminently suitable one for an Oriental genus. In a horticultural sense it is applied to a considerable number of Indian Orchids which differ so much in habit and aspect among themselves that the restriction of the name to a more natural group has become inevitable. In the restricted sense in which Vanda is even now used the species are remarkable for the range of colour observable in the flowers. In some species, as Sanderiana and cærulea, they are of extraordinary attractiveness, in others of so homely a hue that the absence of these from Orchid collections generally is not to be regretted. The stately tricolor of Java and its varieties still hold their own in the estimation of amateurs; and among the dwarfer kinds, cærulescens, cristata, Denisoniana, and especially the latest addition to the genus, Amesiana and Kimballiana, are justly prized.

The successful cultivation of cærulea is, it must be confessed, scarcely an accomplished fact in the full sense of the word, and were it not that this lovely Orchid is plentiful on its native hills England would long since have been its grave. But why? Because the climatic conditions under which it grows in a wild state are simply unapproachable under the artificial arrangements of a glass house in this country. In the first place, it grows at an altitude of 3000 to 5000 feet, where it is not unusual for 8° to 10° of frost to occur in January, while at the opposite season the temperature rises from 80° to 100° F. Secondly, the hilly district, in which Vanda cærulea attains its greatest development, is subjected to one of the heaviest rainfalls in the world, and during the short dry season the plants are fully exposed to the direct rays of a tropical sun. The discovery of a sure method of cultivating this charming Orchid would indeed be a triumph of horticultural skill.

Notwithstanding the length of my review, the great genus Cypripedium should not be passed unmentioned, but both the Indian and South American species, and especially the well nigh innumerable hybrids derived from them, are so popular that they cannot be said to come within the scope of the present paper, the object of which is chiefly to bring under notice many fine Indian Orchids that appear for the time to be receding in public favour, and if anything I have here adduced may tend in the slightest degree to arrest the retrocession my pains will be amply rewarded.—V.

EARLY PEAS.

IN answer to Messrs. Witt and Foster in the *Journal of Horticulture*, June 9th and June 16th, I would advise them to try Veitch's Selected Extra Early Pea for first gathering. It is the earliest variety with which I am acquainted. We sowed in pots on January 25th, planted out the first week in March, and commenced gathering on May 19th. The same treatment was accorded to Chelsea Gem, which was ready for gathering on May 26th. This dwarf Pea is a decided advance on American Wonder. Exonian was sown in the open ground on February 10th, and we commenced gathering it on June 4th. It is of first-class quality, an excellent cropper, and is destined to become a popular variety when its merits are better known.—T. S., *The Gardens, Goodrich Court, Ross.*

DWARF PEAS.

WHEN looking over numerous allotments recently in Surrey I was specially pleased to see just then in fine cropping condition a quantity of both Chelsea Gem and American Wonder Peas. These were undoubtedly the earliest Peas on scores of plots, and had not in any way suffered from drought, whilst taller early Peas had done so materially. I could not but regard these early Peas as most valuable for the allotment holder for various reasons. First, at trifling cost they gave him very early gatherings whilst Peas were yet dear and scarce. Second, they did not materially distress the soil; and third, they were so dwarf that, sown in rows at 24 inches apart, they left ample room for the putting out of Cauliflowers, Cabbages, or other crops between them early in June, as the Peas would be cleared right off by the end of the month. If the closer sowing of the rows needed more seed than is the case with tall Peas at least the cost and labour of staking them was saved, whilst the ease with which a successional crop could follow was great gain. It is a pity that for the mere sake of securing prizes at flower shows these allotment gardeners should be encouraged to grow tall varieties for late purposes. Probably Duke of Albany or some other 5 feet Peas give the finest pods, but if judges would but show greater regard for quality in exhibited Peas, and less for mere size, we should see cottager or allotment gardeners encouraged rather to look to such comparatively

dwarf kinds as Triumph, Stratagem, or Yorkshire Hero, rather than to tall exhausting sorts. Naturally to any allotment holder it is of the first importance that he should fully utilise his ground for the production of winter as well as summer crops, and therefore where summer crops such as late Peas, come off late, I have invariably advised the dibbling out from the seed beds of all kinds of winter cropping plants into other plots where they can make fair growth, for being transplanted later into their permanent positions; very little time is lost in transplanting, and gain is eventually realised.—A. D.

LIVERPOOL NOTES.

FRUIT PROSPECTS.

I THINK it must be generally admitted that the Apple and Pear crop here is one of the most disastrous ever experienced. On every hand "failure" is the only word which can adequately sum up the position. Blossom was abundant, but was blackened by frosts and cutting winds. The following notes may be of interest as representing several places where hardy fruit is grown around Liverpool, and it is to be hoped we may in return hear from other parts of the country as to the state of the fruit crop.

COURT HEY, BROAD GREEN.

Apples and Pears are a very moderate crop. Cherries are very fair, especially Morellos. Of Gooseberries there are scarcely any. Red Currants are a very heavy crop, but Black Currants very few. Strawberries promise a very good crop. Mr. Elsworth considers it the worst year he has ever had for outside fruit.

RAINFORD HALL, ST. HELENS.

Pears and Plums are a failure. Of Apples there is just a sprinkling on Lord Suffields and Irish Peach. Cherries are a moderate crop. Gooseberries are the lightest crop known here for years. Strawberries promise to be a fair crop. Mr. Middleton informed me that, taken all round, the fruit crop is the thinnest he has had for years, and speaking of Pears he said they all showed an abundance of bloom, but there is not one carrying a good crop. He attributes it to the unripe wood of last season.

BLACKLOW HOUSE, ROBY.

Here I may, with the exception of Green Chisel, Citron des Carmes, Pitmaston Duchess, Winter Nelis, Princess, Beurré Diel, a few Marie Louise and Jargonelles, write all the Pears as complete failures. The Pear weevil has this year done untold damage, many of the fruits at present on the trees showing the ill effects of it. Apples are nil, with the exception of Warner's King, Nelson's Glory, Hawthornden, Lord Suffield, Beauty of Kent, Ecklinville Seedling, Stirling Castle, Tower of Glamis, and Summer Pearmain. These are all carrying good crops, and there are a few Peasgood's Nonesuch and Ribstons. Gooseberries on old trees are a capital crop, and would have been better still had they escaped the severe frosts. Red Currants are a heavy crop. Black Currants on young trees are good. Strawberries are a good crop. Plums are a failure, with the exception of a local variety, which rarely fails, and which is good in many other gardens around here. Raspberries are promising remarkably well.

STIGMAPHYLLON CILIATUM.

This is a beautiful stove climber, either for training on the roof-trellis, or pillar. It bears, in addition to the above name, the appropriate one of the Golden Vine. It is scarcely ever met with, why I cannot say. A good plant trained on a trellis was recently in bloom at Ewanville, Huyton, the residence of Joseph Beecham, Esq. I was so interested in it that I thought a short note on it might be welcome, and perhaps induce more to cultivate it. Cuttings of fairly well ripened wood inserted in a mixture of leaf mould and sandy soil with plenty of good sharp sand, and placed in a propagating case having a brisk heat, will very soon root. They may afterwards be potted separately, using a compost of peat, fibry loam, some good coarse sand, and broken charcoal. If kept in a stove temperature they grow away rapidly, and may be used for many purposes. The pleasing shade of green in the leaves, the beautiful flowers, resembling *Oncidium flexuosum* in shape, but with the colour of *Oncidium concolor*, make it quite distinct from ordinary stove plants. Messrs. Cliban, Altrincham, grow it in quantity and with pleasing results.—R. P. R.

EDUCATION IN GARDENING.

YOUR report on "Education in Gardening," page 450, reminds me of past days, and in looking at the marks awarded at the examinations I do not consider them particularly high. But the reason of this may be in the questions asked, or in too severe a test on the candidates. It was my fortune, in 1868, to attend one of the Society's examinations at Kensington, and in the floricultural subject I was fortunate to get 1160 marks out of a possible 1200. In the fruit and vegetable subject I also obtained a first (I forget the number of marks), but would have scored higher had it not been, as I thought, two "catches," two questions that were of such a description. The candidates, I think, should be examined on questions that are well considered, so as to be a fair test of knowledge. Examinations of gardeners are quite to be commended if only for the qualifications for its own sake. As for getting a position through them that is quite a matter of chance, as the posts in gardening

depend so much upon other circumstances. To obtain my certificates it took two or three years' preparation, which I always look back upon with pleasure.—ROBT. MACKELLAR, *Cheadle*.

[Our correspondent is to be congratulated on his success. He had been trained in the art of gardening, and had considerable experience in gardens prior to his examination, whereas the students to whom he refers had no training of the kind whatever. Prior to October last few of them had any knowledge in gardening, and had taken little or no interest in it, and the examination was the result of attending a course of twelve lectures during the winter months. The questions were formulated by the competent examiners from a list of the subjects treated, as supplied to them by the lecturer. The result is considered as both satisfactory and encouraging.]

TOWN ROSES.

So much has been written on Roses of late that one feels it almost necessary to offer an apology for taking up the pen to add to the already abundant literature on the subject, and yet day by day we receive letters seeking information on various points in Rose culture, which show that the writers have not met with the information they stand in need of or have failed to understand it. The most numerous queries that reach us relate to the management of Roses in and around large towns, and to that phase of the subject I propose at the present moment to give my attention.

Even in and around large towns the disadvantages which vegetable life have to contend with vary to a considerable extent. Dense smoke is not always the most inimical of these. The existence of certain chemical works filling the air with the noxious vapours they exhale are often more pernicious. We have known Roses and other plants prosper fairly well amidst dust and smoke, but succumb rapidly after the working of a manufactory of chemicals. If the latter exist extensively, and the consequences of the mischief they produce cannot be modified by scientific or other means, we fear the cultivation of Roses within their influence will give little satisfaction. But mere smoke, the smoke rising from the consumption of ordinary coke and coal, unless in unusual quantities, may be met and negated to more or less extent by proceedings which, if costly, may yet compensate for the trouble and expense incurred.

In very smoky districts we would not recommend the cultivation of Roses otherwise than under glass. A span-roofed house, the slopes facing east and west, the top lights removeable, is recommended for this purpose. It should be heated with 4-inch pipes, and the plants may be either planted in beds or kept in pots. In districts less smoky the plants may be placed in beds or borders out of doors. As in both cases it is the pursuit of Rose growing under difficulties, no point should be missed that is likely to minimise the existing disadvantages. A good soil should be secured for them to grow in. A careful regulation of the temperature and moisture should be secured for the plants indoors, and shelter in spring and winter be provided for those out of doors. Cleanliness is in both cases very important. Not only keeping the plants free from insects by smoking or washing, but keeping the leaves free from sediments of various kinds should be sedulously attended to. A good syringe is an indispensable instrument for this purpose, and a solution of softsoap and quassia forms an excellent wash. Never allow dirt of any kind to remain settled on the leaves, nor allow any insects to rest there long enough to look upon the plants as a home.

Perhaps one of the greatest mistakes made when about to grow Roses in smoky and other unfavourable districts is in an unfortunate or injudicious choice of plants and sorts. Free-breathing Roses are wanted for smoky districts, as free rooting Roses are wanted for heavy soils. But little attention has hitherto been paid to these distinctions, although the practical cultivator knows how important they are. First let me offer a list of sorts that appear most likely to flourish in and around large towns.

FIFTY ROSES FOR VERY SMOKY DISTRICTS TO BE GROWN UNDER GLASS.

Moss.—Crimson Globe and Zenobia.

Hybrid China, &c.—Charles Lawson, Chénédolé, Coupe d'Hébé, Paul Perras, Paul Ricaut, and Paul Verdier.

Hybrid Perpetual.—Albert la Blotais, Alphonse Soupert, Anna Alexieff, Anna de Diesbach, Baroness Rothschild, Boule de Neige, Captain Christy, Charles Dickens, Charles Lamb, Countess of

Rosebery, Countess of Oxford, Crown Prince, Dupuy Jamain, Edward Morren, Elizabeth Vigneron, Ella Gordon, Général Jacqueminot, Heinrich Schultheis, Inigo Jones, Jean Rosenkrantz, John Hopper, Jules Margottin, La France, Madame Cesar Brunier, Madame Clemence Joigneaux, Magna Charta, Marchioness of Lorne, Merveille de Lyon, Mrs. John Laing, Paul Neyron, Pride of Waltham, Ulrich Brunner, Victor Verdier, and Violette Bouyer.

Noisette.—Bouquet d'Or.

Tea-scented and Hybrids.—Cheshunt Hybrid, Climbing Niphetos, Gloire de Dijon, Madame Berard, The Bride, Sunset, and White Lady.

FIFTY ROSES FOR LESS SMOKY DISTRICTS FOR BEDS OR BORDERS OUT OF DOORS.

Moss.—Baron de Wassenaër and Captain Ingram.

Damask.—La Ville de Bruxelles.

Alba.—Celestial.

Gallica.—Cynthia, Duchess of Buccleuch, Ohl, and Surpasse Tout.

Rugosa.—Mme. Georges Bruant.

Perpetual Scotch.—Stanwell.

Hybrid Perpetual.—Alphonse Soupert, Anna Alexieff, Antoine Mouton, Baroness Rothschild, Boule de Neige, Centifolia Rosea, Coquette des Blanchés, Dr. Andry, Duke of Edinburgh, Gabriel Tournier, Garden Favourite, Général Jacqueminot, Gloire de Margottin, Glory of Waltham, Hippolyte Jamain, Jean Cherpin, La Duchesse de Morny, La France de '89, Lord Bacon, Mme. Isaac Pereire, Magna Charta, Mrs. John Laing, Paul Neyron, Prince Arthur, Princess Louise Victoria, and Prosper Laugier.

Bourbon.—Mme. Baron Veillard and Mme. Desprez, Robusta, Sir J. Paxton, and Souvenir de Malmaison.

Noisette.—Aimée Vibert, Céline Forestier, Rêve d'Or, and Wm. Allen Richardson.

Tea-scented and Hybrids.—Gloire de Dijon, Grace Darling, Pink Rover, Reine Marie Henriette, and Waltham Climber.

Thus far of sorts: we have still a few words to say with regard to the selection of plants. Above all things avoid plants that have been made tender by the employment of excessive heat. In May of this year we were in a house of young Roses where the thermometer stood at 96° in the shade at half-past six o'clock in the evening. The grower very truly said "that was the way to make them grow." But is it the way to produce plants that will flourish in the future under the ordinary conditions of plant life? We think not. What sort of men and women should we expect our children to become if in their infancy they were coddled in this manner? Again, we have heard of plants from the north of Britain recommended on the ground that "they are hardier than those brought up in the south." This is a fallacy. The ripening of the wood is, as all experienced persons know, the true test of hardiness, and the shoots of Roses are not likely to ripen better in the north than in the south. Once more, plants that are overfed for the purpose of getting large and fat flowers for exhibition, and plants that are underfed through indolence or greed of gain, are equally objectionable. Everywhere, and always, but in town gardening especially, the purchaser should look for moderate well-ripened wood when purchasing his Roses; he would do so if about to purchase Grape Vines or Peach trees, and this state of the wood is as important in the one case as in the other.—WM. PAUL, *Pauls' Nurseries, Waltham Cross, Herts.*

IVY-LEAF PELARGONIUM SOUVENIR DE CHAS. TURNER.

A FEW days ago, when visiting Crichel, Lord Alington's charming place near Wimborne, I noticed a fine plant of this variety in the porch of the head gardener's (Mr. Beck) roomy and very picturesque house, which is in the Swiss style of architecture. The plant in question had immense trusses of flowers, consisting of pips between 2 and 3 inches across, the flowers being of a deep pink shade of colour, feathered maroon in the upper petals. It is quite an acquisition to this delightful and very easily managed race of Pelargoniums, and is well worthy of the name it bears. Souvenir de Chas. Turner, like Jeanne d'Arc (white suffused with light lavender) and many others of this interesting and very useful section, is well adapted for furnishing walls and pillars in greenhouse, conservatory, and glass corridors. Plants growing in 16-size pots in a compost of three parts good friable loam and one of leaf soil and pulverised cow manure, with a dash of coarse sand added, will cover a large space of wall or trellis in a short time. After the roots have pushed well into the soil surface dressings of Thomson's or some other approved artificial manure laid on two or three times a week before applying clear water will prove very beneficial, promoting and sustaining a vigorous and floriferous growth in the plants not otherwise obtainable. Evidence of Lord Alington's large, beautiful, and well kept gardens being presided over by a good all-round practitioner and a lover of a natural and beautiful style of arranging and planting trees and shrubs for effect, is plainly visible in every department indoors and out.—H. W. W.

EVENTS OF THE WEEK.—To-day (Thursday, July 7th) there will be Rose Shows at Bath, Norwich, Windsor, Woodbridge, and Lee; the latter extending over Friday. Ware Flower Show will also be held on the 7th. On Saturday, the 9th, Reigate Rose Show will be held, also an Exhibition at Wood Green. On Tuesday, the 12th, the usual Committee meetings of the Royal Horticultural Society will be held at the Drill Hall. The Mantell silver challenge cup (value 25 guineas) for twenty-four Roses, distinct, three trusses of each, open, will be in competition, and in the afternoon the Rev. E. Handley will read a paper on "Orchids for a Cool Greenhouse." A Rose Show will be held at Hereford on the 12th, and the Wolverhampton Floral Fête opens on that date, extending over three days. On the 13th there will be Shows at Ealing, Tunbridge Wells, Bexley, and Bedford; one will also be held by the Royal Caledonian Horticultural Society. On the 14th there will be Rose Shows at Harleston and Helensburgh.

— **THE WEATHER IN LONDON.**—Bright warm weather has been mainly experienced in London and its neighbourhood during the past week. The 2nd and 3rd were fine, but the barometer fell throughout Sunday, and rain was expected. It did not, however, come until Tuesday, the 4th being fine; but during most of the afternoon and evening of the 5th rain fell somewhat heavily. At the time of going to press the weather is bright, and the barometer rising slowly.

— **THE JUNE RAINFALL IN SUSSEX.**—The total rainfall at Cuckfield, Sussex, for June was 3.25 inches, being 1 inch above the average. The heaviest fall was 0.94 inch, on the 28th. Rain fell on thirteen days. Total for the six months 8.17 inches, which is 4 inches below the average. The maximum temperature was 84°, on the 28th; minimum ditto 29°, on the 14th and 15th; mean maximum 67.2°, mean minimum 49°; mean temperature 58.1°. Partial shade readings, 4° below the average. —R. I.

— **THE WEATHER IN SOUTH WESTMORELAND.**—Sunday, the 18th ult., will long be remembered owing to the severity of the hail-storm, which did considerable damage here. The morning was bright and warm, but about noon a thunderstorm set in, accompanied by a severe hail shower which completely riddled all tender plants. Chrysanthemums had fully two-thirds of their foliage beaten off, Celery was left almost leafless. Begonias and Petunias suffered worst in the flower garden, being almost denuded of their foliage; while the leaves of Pelargoniums and hardier plants were completely riddled. Funkias and Lily of the Valley had their leaves torn to shreds, and altogether things had a dejected appearance. Fortunately there was little or no wind at the time, or a great deal of glass would have been broken, as several panes are cracked. The storm was very partial, travelling from north to south. At a mile from here eastward no hail fell, and the same distance in the opposite direction they had about 2 inches, while here it was 6 and 7 inches in depth, and in sheltered places was not melted until the afternoon of the following day. Since that time the weather has been cold and showery, vegetation progressing slowly. —W. J. IRELAND, *Sedgwick, near Kendal.*

— **FRUIT SHOW AT EARL'S COURT.**—We have received the schedule of a great Fruit Show to be held at the International Horticultural Exhibition on August 26th and 27th. It comprises forty-six classes. In the first, prizes of £12, £9, £6, and £4 are offered for a collection of fruit not less than twenty dishes. In the second, £8, £6, £4, and £3 are offered for twelve dishes, and prizes of equal value are offered for ten varieties of Grapes, two bunches of each. There are eleven classes for Grapes altogether, two for Pine Apples, two for Figs, six for Peaches and Nectarines (grown and ripened out of doors), five for Plums, nine for Apples (the first five for outdoor fruit), four for Pears (two for outdoor fruit), and four for Tomatoes. The prizes are good throughout. It is added that in connection with this Show a social gathering of the gardeners of the United Kingdom will be held on the afternoon of the 26th, followed by a dinner in the exhibition building, which, with liquid refreshments included, will be provided at 4s. a head. As only a limited number can be accommodated, the tickets will be issued according to priority of application. Dinner at 5 P.M.

— **STEYNING CHRYSANTHEMUM SHOW** has been fixed for November 3rd. Mr. Walter Slaughter is the Secretary.

— **CALLA PENTLANDI.**—The specific name of this plant is surely rendered incorrectly. I think it ought to be *Pentlandiensis*. The terminal "i" indicates a person, not a place. —E. H. M.

— **CALLA ELLIOTTIANA.**—I should like to ask "Boscobel" (vide p. 496) on what authority he states that the original plant of this Calla is a "hybrid between *C. æthiopica* and *C. hastata*." There are very good reasons for believing that it is a distinct species. —W. W.

— **ROSE JULES MARGOTTIN.**—A French writer estimates, probably with accuracy, that it is by hundreds of thousands that Jules Margottin Rose is increased and sold every year, and the transactions to which it has given rise may be totalled by millions of francs.

— **PRODUCTIVENESS OF CALIFORNIAN ORCHARDS.**—This is a Californian estimate of the productive capabilities of orchards in good bearing condition and under good cultivation. Tons per acre: Apples 4, Apricots 5, Prunes 6, Pears 5, Figs 8, Peaches 5, Walnuts and Almonds each 1½.

— **GLOXINIAS AT RICHMOND.**—Messrs. Sutton & Sons were awarded a first-class certificate at the Richmond Show for their distinct and pure variety Her Majesty. The flowers are smooth, spotless, and massive, showing with great effect in contrast with the dark green foliage. The scarlet and white Duke of York was also certificated, and it is undoubtedly a beautiful Gloxinia.

— **SEQUOIAS AT THE WORLD'S FAIR.**—From California is to be exhibited at the World's Fair one of the famed huge Redwood Trees, or *Sequoia gigantea*. The one selected is 300 feet high, and more than 30 feet in diameter at the base. A specially constructed train will be necessary to carry the monster across the continent. It is the intention to hollow the base into booths, in which will be sold California wines, fruits, and curiosities made of polished redwood.

— **EXPRESS GRAPE GROWING.**—A correspondent writes:—"The question of ripening Grapes in ninety days from starting the Vines is causing some excitement in the north, and gardeners have been subjected to close questioning by their employers. The Sunderland Gardeners' Society is, however, determined to thresh the question out, and a special meeting is summoned, which Mr. Gilchrist is requested to attend and explain the manner in which the feat was accomplished."

— **FIBROUS-ROOTED BEGONIAS.**—It appears likely that Messrs. Sutton are going to provide us with a new and valuable class of Begonias. The two fibrous-rooted varieties, Duchess of Edinburgh and Crimson Gem, exhibited by them at Richmond Show, and certificated, were delightful from their compact habit, free flowering, and charming colours. The former was white margined with rose, a chaste and delicate flower, the latter bright crimson. It will be interesting to watch the development of this class.

— **MOCK ORANGES.**—There is a remarkable display of the beautiful Mock Orange, *Philadelphus grandiflorus*, at Adon Mount, East Dulwich. Dozens of huge bushes are wreathed in blossoms, which stud the long branches in racemes from base to apex. The ivory white flowers are deliciously scented. As grown in this delightful suburban garden the large-flowered Mock Orange is magnificent, but its condition only matches that of other plants, for in Mr. Henderson's hands there are few that do not exhibit their best characteristics.

— **FERTILISERS FOR TOMATOES.**—As the Tomato combines the good qualities of a fruit and a vegetable, its consumption is large and is rapidly increasing. The warm soils of the Southern States of America bring this crop to perfection. Mr. G. Speth, at the Georgia station, has tested the effect on Tomatoes of single fertilising materials, of combinations, and of successive applications of these. The soil was a hard clay, with a clay subsoil. The fertilisers were incorporated with the soil. The application of nitrogen or potash alone did not increase the yield on poor land. The effect of the nitrogen depended on the presence of phosphoric acid and potash. Only the complete fertilisers gave profitable returns. The yield increased with the amount of complete fertiliser used. The nitrate of soda did best in two applications. Phosphoric acid, in double ration, not only decidedly increased the yield, but also furnished the earliest fruit. Large rations of nitrogen, especially in the form of cotton-seed meal, prolonged the time of bearing. These fertilisers were profitably applied in June when cultivating.

— **MEDINILLA MAGNIFICA.**—A fine specimen of this magnificent plant is now flowering profusely in the Victoria House at Kew, standing in the tank. It is a native of the Phillipine Islands, introduced by Messrs. Veitch & Sons through their collector Thos. Lobb. A plant was exhibited at a meeting of the Royal Horticultural Society by Messrs. Veitch as long ago as April 2nd, 1850, and received at that time the Society's large Banksian medal.—C. K.

— **DEUTZIA CRENATA FLORE-PLENO.**—A well-flowered specimen of this fine Japanese shrub may be seen loosely trained to a wall in the Royal Horticultural Society's gardens at Chiswick. Although facing east it is somewhat sheltered, and is flowering in advance of the plants in the borders. The ovate leaves are rough to the touch, and the white or blush-coloured flowers are produced in abundance. It is a wonder that it is not planted more extensively on sheltered borders and shrubberies.—C. K.

— **HARVARD UNIVERSITY** is indebted to the munificence of Prof. George L. Goodale, the Director of the Botanic Garden at Cambridge, Mass., for a remarkable development of the botanical establishment of the University during the last ten years. It has acquired a large fire-proof Museum, to contain not only its collections but its lecture-rooms and laboratories; has added greatly to its collections and its library; and has also obtained larger permanent funds for its support.

— **EARLY PARIS MARKET LETTUCE.**—This fine variety has proved of great service this season. With us it hearts very quickly, and was the earliest Lettuce producing large heads, which are crisp and tender. It should be grown by all. Paris Green has proved a grand Cos Lettuce on our light soil, and although the weather has been exceedingly dry not one plant has bolted. The large full heads of this variety have been our mainstay of late, and have been much appreciated.—H. DUNKIN.

— **PROPAGATING LOBELIAS.**—During an interesting discussion at the last meeting of the Sunderland Gardeners' Improvement Society, the principal point advocated in the increase of these plants was striking the cuttings now in a cold frame. When rooted, the plants are kept close to the glass with abundance of air. By that practice robust cuttings are plentiful in January, and if the plants raised from these are grown in a moderate temperature they assume a sturdy habit and flower early and continuously.

— **JUNE WEATHER IN HERTS.**—The past month has been highly favourable for agricultural and horticultural purposes. With the exception of the frost on the morning of the 14th there has been little to complain of. Of sunshine there has been an abundance and rains frequent. Rain fell on fourteen days during the month. The maximum in any twenty-four hours was 0.61 inch on the 28th; minimum, 0.2 inch on the 19th. Total for the month, 2.71 inches, against 1.40 inch during June, 1891.—E. WALLIS, *Hamels Park, Buntingford, Herts.*

— **DR. LIVINGSTONE STRAWBERRY.**—I am sending you a few Strawberries of Dr. Livingstone so highly spoken of by "A Lanarkshire Bee-keeper." It is highly approved by my employer for its good flavour, and the crop is heavy. The fruits are of fair size with us, those sent being large and small to show a fair sample; grown in dry sandy soil on sharp slope to the S.W. I think on better soil it would grow larger; it follows Noble in ripening.—R. C. [Many of the fruits were spoiled in transit, but those which arrived sound were of excellent quality—the flavour reminding of Keens' Seedling in its best condition, but fuller and richer. Dr. Livingstone, we suspect, is a good Strawberry.]

— **BURNING OLD POTATO TOPS.**—There is very little value in Potato tops except their ash. They are rich in potash, and this mineral is not lost by burning nor made less available. Time was when it was commonly advised to gather Potato tops in the barnyard and rot them down for manure. But this is possibly the surest way to spread the germs of disease. It is quite likely that as the Potato growth begins to decay then disease attacks it and hastens this process. Certainly there is very little bulk left in spring of a large heap of green Potato tops that have lain on the ground through the winter. Burning the tops rids the ground so far as possible of the germs of disease for future Potato crops. Still, whatever care be used, it is never advisable to plant Potatoes twice in succession. The tubers rot worse in gardens than in open fields, where no crop is grown two years in succession, and probably for this reason.—(*American Cultivator.*)

— **GARDENING APPOINTMENT.**—Mr. George H. Head has been appointed gardener to Mrs. Gregory, Oakfield, Reading.

— **A NEW WAY OF DRAINING LAND.**—H. Kennedy writes to the "American Agriculturist" that he has tried the following method of draining his garden, which is located near the top of a hill:—"The soil is a heavy clay about 4 feet deep and underlaid with slate, which is impervious to water. I drilled a 4-inch hole, 12 feet deep, and put in 2 lbs. of dynamite and 25 lbs. of rock powder; then I inserted a double fuse, filled up the hole with dry sand and fired the fuse. The explosion made very little report, but raised the top of the ground at the hole about 2 feet, and the surface was raised all round for fully 30 feet from the hole. The expense was not very great, and the success quite decided."

— **ARCHES OF FUCHSIAS.**—The single Begonia house in Messrs. Veitch & Sons' Nursery at Chelsea is now a beautiful sight. In addition to the Begonias there are a series of Fuchsia arches formed by training plants up the rafters and along the top stays. They are full of luxuriant leafage and brilliant with flowers. Amongst the varieties are *Souvenir de Mrs. Todman*, which is loaded with bloom, *The Shah*, *Maud*, *Elegans*, *Mrs. Todman*, *Olympia*, *General Grenfell*, *Dr. Matthew*, *Andrew Gill*, and *Grande Duchesse Marie*. The plants are in 8-inch pots, a pair being placed side by side and trained up each rafter. Their clusters of graceful flowers drooping down over the pathway in thousands produce a splendid effect.

— **BEGONIA VERNON** (*B. semperflorens atropurpurea*).—It may be well to note the behaviour of this Begonia under exposure in the open. The plants which had been kept under glass last year gave not the slightest sign of being other than a bright-flowered form of *B. semperflorens*. I transplanted them to a sunny border, and never beheld a more remarkable transformation in any plants. Within two days the deep green leaves began to take on bronzy and blood-stained tints of the most striking character, and the indications are that in this variety we have a new bedding plant possessing many excellent points, easily and quickly propagated, bright, striking, showy, and free flowering, dark crimson usually. It should be a good wet weather plant. Its ability to stand full exposure without scorching of the margin of the leaves remains to be tested. It is certainly a variety worthy of trial.—J. N. G. (*in Garden and Forest*).

— **EARLIEST AND BEST VARIETIES OF STRAWBERRIES.**—I am deeply interested in all fruits, but Strawberries in particular, and gladly accept the invitation in "Nomad's" interesting leader, to give my experience, so far. I say "so far," for the Strawberry season in Ireland, and presumably in the greater part of England and Scotland, has only fairly commenced. My earliest variety was *Scarlet Queen*, a comparatively light cropper, but of the most delicious flavour on June 9th on a warm south border, from young plants received direct from the raiser, and which presumably will be finer and larger next season. In flavour this leaves nothing to be desired. *Noble* came next, just a few days later; it has larger berries, and is, at least with me, three times a heavier cropper. I admit it has not the rich vinous flavour of *Scarlet Queen*, but when grown in the open without any shading the flavour is rich and luscious. For market purposes I have yet to learn the name of any variety to compare with *Noble*. *Vicomtesse Héricart de Thury* came next, and whatever it does in other soils (I will refer to mine later on), I shall be obliged to discard it. *Competitor* (*Laxton*) was the next, and I am not sure it will not be the largest fruit and heaviest cropper of twenty varieties I shall test. It may be described as scarlet orange, and for an early Strawberry seems very prolific. *Commander* closely followed, and in bearing aloft its finely flavoured fruits, on stout stalks, is distinct from any other. The flavour is excellent, but I notice the later fruits on the stalks, unless the plants are fed, will be smaller. *White Knight* I have been gathering fine fruit of, but it would be a mistake to suppose it is "white," the colour being light scarlet, and shading to white underneath where the light could not reach. This variety, like most others, likes plenty of room, and does best on a somewhat raised bed. The shape of the berries reminds me of *Auguste Nicaise*, but they are not so long or conical; it is a heavier cropper. Strange as it may seem, *Sir Joseph Paxton* has wholly failed with me on a south-east aspect, and *British Queen* on a west makes more growth than fruit. *Dr. Hogg* is medium, and *James Veitch* very prolific. *Latest of All* promises well. Mine is a walled-in town garden, fully exposed, and with light soil of a limestone formation on a gravelly subsoil. I must decidedly keep manuring and feeding.—W. J. MURPHY, *Clonmel*.

— TREES IN GERMAN CITIES.—In most of the German cities visited I was surprised to find the Elm so little used as a shade tree, but in Hamburgh the English Elm (*Ulmus campestris*) is quite commonly planted, and there are some fine avenues of it, forming beautiful Gothic arches over a number of streets. Very uniform rows of the Linden (*Tilia vulgaris*) are also to be seen, all the trees being of about the same size, at equal distances apart, and in fine condition. The advantage of planting only one kind of tree in a single line is well shown, and altogether the streets of this city are much better than the average in the matter of shade. Sometimes the foliage of the Lindens, Maples, and Elms had a grey appearance, owing to attacks by little red mites, and in a few cases the Lindens had lost many leaves from this cause.—J. G. JACK (in *Garden and Forest*).

— EFFECT OF SPRAYING ON THE APPLE SCAB.—The subject was investigated most thoroughly at the Ohio Station last season. The conclusions may be stated briefly as follows:—The growth of the scab fungus may be checked by spraying the trees at proper times during the spring, with several of the copper compounds used as fungicides. The most convenient and satisfactory one tested so far, considering the cost, convenience, and effectiveness, is a dilute Bordeaux mixture, containing 4 lbs. of copper sulphate, 4 lbs. of lime, and 50 gallons of water. While it has not been found practicable to completely prevent the growth of scab in a single season, the experiments demonstrate that it is practicable to so reduce the injury from the fungus that the total value of the crop will be greatly increased, far more than is necessary to repay the cost of using the fungicides. Judicious spraying with fungicides also tends to check the dropping of immature fruit in the spring; to cause it to grow larger in size; more free from blemishes; to hang better on the tree while ripening, to take on a higher colour, and to improve its keeping quality. Measured by the market value, spraying added nearly 100 per cent. to the value of the crop at little more than 6d. per tree. It has also been demonstrated that the Plum Curculio may be held in check by spraying almost as effectually as by jarring, and far more cheaply.

— PROGRESS IN BEGONIAS.—As an enthusiastic admirer of the Tuberous Begonia, and the grower of a large collection of all the finest sorts I can get direct from their raisers both at home and on the Continent, and having been the first to bed them out in the kingdom. I have read your correspondent "W. P. W.'s article on my favourite flowers with considerable interest, but all his statements are not accurate. For instance, Picotee is not unique of its kind as he states, as for the last two years I have grown a most beautiful variety under that name, raised by the well-known grower Mr. B. R. Davis of Yeovil, after whom Monsieur Crousse of Nancy has named one of his finest varieties. In habit of growth and size of flower Mr. Laing's variety is doubtless a great advance on the Yeovil variety, but as to the distinctness of the red margins to the petals I do not think there is much to choose between them. Then he leads one to suppose that all the beautiful varieties he mentions were raised at Stanstead Park Nursery by Mr. Laing, whereas many of them, such as Major Hope, Mrs. French, and others that I cannot now remember as I have not your paper by me to refer to, were raised and sent out by Monsieur Félix Crousse of Nancy, from whom I had them direct. Your correspondent should come and see my collection.—W. E. GUMBLETON.

— FLAVOUR IN MELONS.—Whilst it is impossible to lay down any rule with respect to Melons I think none the less that green flesh varieties more often exhibit good flavour than do either white or scarlet flesh varieties. Another thing which seems to mark Melons is that big fruits, however handsome, are seldom well flavoured, and in that respect these fruits seem to follow the lead of ordinary fruits and vegetables, for with large ones what is known as quality is rarely associated. Six very large and handsome Melons were sent to the last meeting of the Fruit Committee of the Royal Horticultural Society for certificate, and they were commended to attention because represented as weighing 29 lbs. The one tasted, however, proved to be almost unpleasant, whilst of other Melons the only really good flavoured one was a medium sized mottled green flesh. I fear that we shall never get a Melon which gives constant quality. That excellence it is feared never will come to any variety; indeed it is doubtful whether with all the crossings and intercrossings which go on on every hand any real progress is made either in flavour, in fidelity to character, in hardiness or in prolificacy, or has been made during the past twenty years. If it can be shown that real advance has been made I shall be very pleased to learn; but this much is certain, that no grower, even if he has a hundred of the best looking fruits of the very best reputed sorts,

can guarantee that any one or a score of fruits he may select as the best flavoured will exhibit any special excellence whatever when tasted. No doubt very great judgment is needful in determining when a Melon is at its best, and if one be on a given day exceptionally good, then be cut and kept perhaps for three days, the flavour has disappeared. Many Melons when cut show the flesh throughout either too soft and pulpy or one-half quite hard, the inner flesh too soft or perhaps too hard throughout. A perfect Melon is one of a thousand fruits.—A. D.

— COLDER SEASONS AND VEGETATION.—Mons. Flammarion, the French astronomer, has recently been directing attention to the climatic changes in France. According to the United State Consul at Bordeaux, he states that, from actual figures obtained within the past six years, the temperature of Europe has been falling. France has been suffering for a long time from an excess of cold weather, the thermometrical readings at Paris having been 1° Centigrade below the normal height. Other readings show even less favourable results. The fall is more noticeable in the spring than during other periods of the year. Similar phenomena are recorded in Great Britain, Belgium, Spain, Italy, Austria, and Germany, while the really cold countries, such as Denmark, Norway, Sweden, and Russia, have enjoyed during the last four years a temperature slightly above the average. In the days of Philippe Auguste, in the thirteenth century, the wines of Etampes and Beauvais were the favourite beverages at Court. Henry IV., a pronounced *bon vivant*, frequently expressed his fondness for the product of the Suresnes Grape. At the present day there is not a vineyard of importance north of Paris; and as for the *petit vin* now made at Suresnes, it has become only the drink of the poorer classes. In the middle of the sixteenth century Maçon was celebrated for its Muscat wines, whereas the Muscatel Grape at this moment can scarcely be made to thrive there. Ancient chronicles mention the cultivation of the Vine in Northern Brittany, where now even Apples are not plentiful. Again, it is to be remarked that trees which once flourished in the north of France are at present found only in the extreme south, and a considerable number have disappeared altogether. Languedoc no longer grows the Lemon; there is not an Orange left in Roussillon. The Lombardy Poplar, so familiar and picturesque an object in old French line engravings, is nowhere to be found on French soil. These are facts which, says Consul Knowles, putting statistics out of the question, serve to illustrate the changes wrought by temperature in the great fruit-producing country of France.

CHRYSANTHEMUM NOMENCLATURE.

I THINK I am fairly entitled to a reply to Mr. Molyneux (page 451, June 16th). If your correspondent will refer to his Journal for November 27th, 1890, page 474, he will find a long report of the Alverstoke and Gosport Show. In the principal class for twenty-four blooms, half incurves and half Japanese (distinct), he will there find J. Lambert and Emily Dale Improved (or Golden Queen) shown in the first prize stand by a neighbour of his, Mr. Agate, who is a good grower. I now call on Mr. Molyneux to be as good as his word, for he said the admission of my sport in prize stands with Golden Queen of England would be the time to admit its distinctness. I hope Mr. Molyneux will not blame the Judges. Does he know that John Lambert was certificated at Bristol? The Judges there nor the Floral Committee of the N.C.S. could hardly be mistaken.—J. LAMBERT, *Powis Castle, Welshpool, N. Wales*.

[We agree that our correspondent is entitled to this reply, since he has at last given the reference for which readers were waiting—the report of the Alverstoke Show; and now Mr. Molyneux is equally entitled to answer Mr. Lambert.]

COMMON CARNATIONS.

I OBSERVE some remarks made by "P." upon this subject in your last issue, to which I venture to take exception. I gather that he recommends the sowing of "seed of cheap border varieties," and I cannot refrain from asking why he should sow cheap or common seed when good reliable seed is within the reach of everyone who will take the trouble to raise it. The difference between good and bad seed is about as follows:—From cheap, and therefore probably foreign seed, he will get perhaps 10 per cent. of double or semi-double flowers, rough and

fimbriated, which the most elementary "florist" would consign to the rubbish heap; and from good seed he would get 50 or 60 per cent. of doubles—many good, and possibly one or two very good, a credit to himself and a pleasure for years to come to those who love Carnations.

I quite allow that "florists' Carnations" are not such free seeders as the mass of foreign sorts with which too many English gardens are overrun, but there are many good free and vigorous varieties which may be had at but small cost, and which are worthy of a place on the exhibition table, and at the same time may be relied upon to seed freely. The first cost of a few shillings for plants is all the outlay required, and the only precaution necessary is to move the plants under cover of some sort during the autumn to prevent the seed pods being rotted by the rain. The process of fertilisation is absolutely simple, and the result I venture to affirm will well repay the small cost and labour involved.

I thoroughly agree with your correspondent as to the beauty and profusion of bloom displayed by a bed of Carnation seedlings, but I hold it to be foolish to be content with indifferent seed when a small outlay and a little trouble will provide him with the best. The difference of quality of the produce will convince the most idle or economical that the needful trouble and money have been indeed well laid out.—
MARTIN R. SMITH.

CORNUS KOUSIA.

At the meeting of the Royal Horticultural Society on June 21st Messrs. James Veitch & Sons exhibited a handsome shrub under the name of *Cornus Kousia*. Its luxuriant and attractive leafage, which is oval shaped and rich green, and the pure white Trillium-like fragrant flowers, combined to attract considerable attention and admiration, and a first-class certificate was awarded.

Cornus Kousia is figured and described in Siebold's "Flora Japonica," I., page 30, t. 16, under the name of *Benthamia japonica*. The genus *Benthamia* has long since been very properly merged into *Cornus*, and hence the present name of the plant has probably in some measure obscured its origin. According to Siebold it is a dense bushy shrub about the height of a man, or a little higher, growing wild on the mountains of Kinsin and Nippon in Japan from 2000 to 4000 feet elevation, flowering in May and June. Messrs. Veitch's plants were obtained about twelve or fourteen years ago from Japan through Mr. Maries. The species may have been introduced earlier into Dutch gardens by Siebold himself, but we do not remember seeing any plants besides those of the Chelsea firm, and we believe it is still very rare in British arboreta, if represented at all. Its affinity with the Himalayan *Cornus* (*Benthamia*) *fragifera* is very manifest.

This appears to be in every way a distinct shrub, and should prove a valuable addition to gardens. Bushes such as those described growing in Japan could not have otherwise than a picturesque effect when clothed with pearly flowers, such as are depicted in the engraving.

ROSE SHOWS.

NATIONAL ROSE SOCIETY, CRYSTAL PALACE.—JULY 2ND.

It is well understood that an Englishman's favourite topic is the weather, and when the Englishman happens to be a Rose grower as well it becomes a subject of absorbing interest. This is but natural considering what an influence the weather has upon the flowers, and how completely it may favour or foil the exhibitor. To a large extent he is at the mercy of the elements. To point to a familiar instance, compare 1889 with 1891, or, more recent still, with 1892. In the former hot early season the southern flowers were hurried on with the grower powerless to apply a brake, and the date of the National Society's Show at the Crystal Palace found them somewhat past their best. What was their poison, however, was the northern growers' meat, and, as will be remembered, Messrs. Harkness & Son won the nurserymen's trophy with a magnificent stand, following this up with a remarkable series of victories in other parts of the country. But time brings its revenges. 1890 found the Yorkshire growers unable to raise anything approaching their strength of the previous year, and the southern and western rosarians fought out the issue, Mr. Frank Cant of Colchester proving victorious in the great class. Worse still was 1891. Messrs. Harkness hardly had any blooms out, even on their cut-backs, while Mr. Frank Cant could not get a representative stand together, and consequently the winners of 1889 and 1890 both had to stand down and, like Achilles, leave the fray to others. Under these circumstances Mr. B. R. Cant came to the front once more, scoring his sixth win since the institution of the trophy. This year has again proved to be a late season, and once more the Bedale exhibitors found it impossible to get a stand together. Both the Cants were, however, able to do so, and with Messrs. Paul & Son of Cheshunt, and Turner of Slough, also competing, the issue lay between four southern growers. It was quickly observable that there was going to be a very hard tussle between the Colchester namesakes for the first place. In size, form, and freshness there seemed nothing to choose between them at a cursory inspection,

and it was only after lengthened examination and careful pointing that a decision could be made, Mr. Frank Cant scoring his third win.

In the amateurs' section Mr. E. B. Lindsell appears to have made up his mind to take the trophy under his protecting wing and keep it there. He did not compete in the class for it in 1889, when Mr. W. J. Grant won, but, encouraged apparently by his success in other classes then, he entered in 1890, won the trophy, repeated the process in 1891, and this season by another success claims the splendid record of three consecutive victories, a feat which has never been accomplished before. His last win was not by any means an easy one, Mr. Budd surprising many by the excellence of his stand, and giving his redoubtable opponent a hard fight. With perseverance he may yet have the pleasure of seeing his name in the honours list; he has improved, and may improve more.

As to the general quality of the flowers in these and other classes it may fairly be put down as satisfactory. Probably few expected the blooms to be so good considering the lateness of the season and the earliness of the Show. They were not quite up to the average in point of size, no doubt owing to maidens not yet being ready, which always means loss of weight, but in other respects they were very good, the brightness, freshness, and finish of the flowers being very noteworthy. The entries were numerous throughout, the exhibition filling the large concert room and one side of the auditorium.

Some curiosity was naturally felt as to how the new arrangement of exhibitors in which they are classed in accordance with the number of plants grown would result. It appears to be a marked success, bringing into the field a number of small exhibitors who would, in all probability, not have ventured forth under the old order of things. It entails a considerable amount of class repetition, but that is unavoidable, and the end in view justifies it.

The following are particulars of the awards:—

NURSERYMEN'S CLASSES.

The leading class in this section was for seventy-two distinct varieties, single trusses, and with which there were four entries. As is generally the case the competition was keen, but the palm was awarded to Mr. Frank Cant, Braiswick Nursery, Colchester, for a beautiful collection. The blooms were remarkably even and delightfully fresh. They were shown in three boxes, twenty-four blooms in each. The blooms were staged as follows:—Box 1, back row: A. K. Williams (good), Mrs. J. Laing, Etienne Levet, Merveille de Lyon, Countess of Oxford, Pride of Waltham, François Michelin, and Madame Eugène Verdier. Middle row: Marie Verdier, Exposition de Brie, Lady Mary Fitzwilliam, Dr. Sewell, Mary Bennett, Dr. Andry, La France, and Louis Van Houtte. Front row: Comtesse de Ludre, Comtesse de Nadaillac, Prince Camille de Rohan, Queen of Queens, Cheshunt Scarlet (good), Lady Helen Stewart, Mons. E. Y. Teas, and Souvenir d'un Ami. Second box, back row: Dupuy Jamain, Margaret Dickson, La France 1889 (a darker variety than the original La France), Souvenir d'Elise Vardon, Rosieriste Jacob (very good), Jeannie Dickson, Charles Darwin, and Gustave Piganeau. Middle row: Madame Cusin, Francisque Rive, Maréchal Niel, Crown Prince (very fine), Souvenir de la Malmaison, Marie Baumann, Emily Laxton, and Annie Wood. Front row: Countess of Rosebery, Marguerite Boudet, Marchioness of Lorne, Heinrich Schultheis, Gloire de Bourg-la-Reine, Auguste Rigotard, Pride of Reigate (good), and Horace Vernet. Third box, back row: Ulrich Brunner, Madame Gabriel Luizet, Suzanne Marie Rodocanachi, Madame de Watteville, Duke of Edinburgh, Marie Finger, Star of Waltham (good), and Her Majesty. Middle row: Germaine Caillot, Prince Arthur, The Bride, Boieldieu, Niphotos, Général Jacqueminot, Baroness Rothschild, and Charles Lefebvre. Front row: Duchess of Bedford, Viscountess Folkestone, Duke of Wellington, Victor Hugo (grand), Le Havre, Ernest Metz, Reynolds Hole, and Madame Caroline Kuster. The second prize fell to Mr. B. R. Cant for a grand collection of blooms, though not quite so even as those in that of his opponent. He, however, was awarded the Society's silver medal for the best Tea or Noisette, showing a grand bloom of Souvenir d'Elise Vardon. Her Majesty, Mrs. Paul, Victor Hugo, Duke of Teck, and Baroness Rothschild were also specially good in the second prize collection. Messrs. G. Paul & Son, The Old Nurseries, Cheshunt, gained the third prize, showing a meritorious collection, amongst which Captain Christy, Victor Verdier, Horace Vernet, and Charles Lefebvre were very good.

The entries in the class for forty-eight distinct, three trusses of each, were not numerous, but the competition was very keen. Mr. Frank Cant here also carried off the leading honours, staging one of his characteristic collections. The blooms were very fresh and even. The varieties shown were Merveille de Lyon, Madame Pereire, Horace Vernet, Etienne Levet, Heinrich Schultheis, Dr. Sewell, Marie Verdier, Marguerite de St. Amand, Madame Eugène Verdier, Ulrich Brunner, Louis Van Houtte, Pride of Waltham, Maurice Bernardin, Hon. E. Gifford, François Michelin, Duc de Wellington, Prince Arthur, Mrs. John Laing, Countess of Rosebery, Madame Gabriel Luizet, Baroness Rothschild, Fisher Holmes, Lady Mary Fitzwilliam, Victor Hugo, Crown Prince, Catherine Mermet, Duke of Edinburgh, Madame de Watteville, Cleopatra, Dupuy Jamain, Souvenir d'un Ami, Marie Baumann, Her Majesty, A. K. Williams, Madame Cusin, Marie Finger, La France, Duke of Connaught, Jeannie Dickson, Innocente Pirola, Fisher Holmes, Comtesse de Ludre, Général Jacqueminot, Pride of Reigate, Boieldieu, Emily Laxton, Alfred Colomb, and Souvenir d'Elise Vardon. Mr. B. R. Cant was a close second, the blooms in this case being not quite so fresh as in the first-prize stand. Still, it was a remarkably fine collection, and at an ordinary show would have taken

the leading place. Mr. C. Turner, Slough, was awarded the third prize for a stand of fresh though small blooms.

For forty-eight distinct, single trusses, there were six entries, and after a close competition the first prize was awarded to Messrs. G. Cooling and Sons, Bath, for charmingly fresh blooms. The varieties in this contribution were—Back row, first box: Heinrich Schultheis, Baroness Rothschild, A. K. Williams, Pride of Waltham, Horace Vernet, Duchesse de Vallombrosa, Victor Hugo, and T. W. Girdlestone. Middle row: Madame C. Kuster, Barthelemy Joubert, Etoile de Lyon, Robert Marnock, Marie Cointet, Violette Bouyer, Sénateur de Vaisse, and Général Jacqueminot. Front row: Ulrich Brunner, Princess Beatrice, Countess of Oxford, Lady Mary Keith, Baron Haussmann, Merveille de Lyon, Le Havre, Duchesse de Morny. Second box, back row: Madame Isaac

Middle row: Marie Baumann, Gloire Lyonnaise, Heinrich Schultheis, Hon. Edith Gifford, Mons. E. Y. Teas, Madame Gabriel Luizet, Dupuy Jamain, and Mrs. J. Dickson. Front row: Baroness Rothschild, Cheshunt Hybrid, Souvenir d'un Ami, Star of Waltham, Countess of Pembroke, Prince Camille de Rohan, Catherine Mermet, and Duke of Wellington. The second prize went to Mr. J. Mattock, The Market, Oxford; and the third to Mr. G. W. Piper, Uckfield, Sussex. In both cases the blooms were fresh and bright.

The entries in the class for twenty-four distinct trebles were more numerous, there being no less than eight competitors. The leading prize went to Messrs. B. Prior & Son, Myland Nurseries, Colchester, for a collection of even and fresh blooms. In this case the flowers were shown in three boxes, and comprised the following varieties:—Mrs.

FIG. 2.—CORNUS KOUSIA.

Pereire, Comte de Raimbaud, Ernest Metz, Dr. Andry, Mrs. J. Laing, Duke of Connaught, Madame G. Luizet, and Suzanne Marie Rodocanachi. Middle row: Anna Ollivier, Madame M. Verdier, Dupuy Jamain, Madame Cusin, Sénateur Vaisse, La France, A. Dumesnil, and The Bride. Front row: Mrs. Watson, Prince Arthur, Mons. Noman, Maréchal Niel, Marguerite de St. Amand, Victor Verdier, Hon. E. Gifford, and Magna Charta. Messrs. G. & W. Burch, Peterborough, were the winners of the second prize in this class, and the English Fruit and Rose Company, Limited, King's Acre, Hereford, came in third. Messrs. Burch's blooms were rather small, but delightfully fresh and even.

There were five entries in the class for twenty-four distinct, single trusses. Mr. W. Taylor, Oxford Nursery, Hampton, Middlesex, was placed first for a stand of beautiful blooms. The varieties shown were—back row: Marquise de Castellane, Le Havre, Her Majesty, Louis Van Houtte, La France, Victor Verdier, Mrs. J. Laing, and Ulrich Brunner.

J. Laing (good), Catherine Mermet, Etienne Levet, Merveille de Lyon, Marie Baumann, Jean Ducher, Prince Arthur, Baroness Rothschild, Général Jacqueminot, Souvenir d'Elise Vardon, La France, A. K. Williams (good), Horace Vernet, Duchesse de Vallombrosa, Lady Mary Fitzwilliam (very fine), Fisher Holmes, Maréchal Niel, Ulrich Brunner, Innocente Pirola, Heinrich Schultheis, Niphotos, Alphonse Soupert, Vicomtesse Folkestone, and Sultan of Zanzibar. Messrs. G. & W. H. Burch were awarded second prize for a collection of fresh, though small blooms; and Mr. G. Mount, Canterbury, secured the third prize.

AMATEURS' CLASSES.

In class 6, forty-eight blooms, distinct, the principal amateurs' class, there were six stands, and the competition was so close that the making of the awards proved to be a difficult and prolonged task. Eventually the first prize went to Mr. E. B. Lindsell, Bearton, Hitchin, whose flowers have been so backward that a few days ago his success appeared

to be impossible. The blooms had, however, come on very rapidly during the past day or two. They were not large, but were perfection in freshness, colour, and finish. The varieties were as follows—Back row : Dupuy Jamain, Comtesse de Nadaillac, A. K. Williams, Innocente Pirola, Duke of Wellington, Marquise de Castellane, Ulrich Brunner, François Michelin, Gustave Piganeau (very fine), Lady Mary Fitzwilliam, Duke of Edinburgh, Mrs. John Laing, Prince Arthur, Baroness Rothschild, Horace Vernet (very fine), and Her Majesty. Middle row : Captain Christy, Mons. Noman, Etoile de Lyon, Dr. Sewell, Madame de Watteville, Charles Lefebvre, Catherine Mermet, Xavier Olibo, Caroline Kuster, Alfred Colomb, Madame Cusin, Star of Waltham, Souvenir d'Elise, Prosper Laugier, Etienne Levet, and Comte de Raimbaud. Front row : Sir Rowland Hill, The Bride, Maurice Bernardin, Niphotos, Marie Rady, Marie Van Houtte, Louis Van Houtte, Duchesse de Vallombrosa, Dr. Andry, La France, Reynolds Hole, Prince of Wales, Suzanne Marie Rodocanachi (very good), Francisca Krüger, Abel Carrière, and Madame G. Luizet. Mr. Lindsell's success in winning the trophy for the third season in succession is worthy of every praise. Mr. S. P. Budd, 8, Gay Street, Bath, was second with a very beautiful collection of flowers, although not of the largest size. His Grand Mogul, Etienne Levet, Mrs. John Laing, Comtesse de Nadaillac, and Souvenir d'Elise Vardon were very fine, especially the latter, which was a superb bloom. The Rev. J. H. Pemberton, Havering-atte-Bower, Romford, was third, also with an admirable stand. As usual he will no doubt improve as the season goes on.

In class 7, for thirty-six blooms, distinct, there were five stands in competition here, and Mr. J. Brown (gardener to Mrs. Waterlow, Great Doods, Reigate) was the winner. His flowers were medium to small in point of size, but well coloured, clear, and fresh. The varieties were as follows :—Back row : Mrs. J. Laing, Duke of Edinburgh, Pride of Waltham, Duke of Wellington, Marie Finger, Mrs. Baker (a splendid bloom), La France, Dupuy Jamain, Her Majesty, Duke of Teck, Vicomtesse Folkestone, and Heinrich Schultheis. Middle row : A. K. Williams, Marquise de Castellane, Xaxier Olibo, François Michelin, Victor Hugo, Mdme. G. Luizet, Star of Waltham, Marie Rady, Mdme. Isaac Pereire, Marie Cointet, Lord F. Cavendish, and Duchesse de Vallombrosa. Front row : Merveille de Lyon (very fine) Jean Liabaud, Suzanne Marie Rodocanachi, Prince Camille de Rohan, Dr. Andry, Louis Van Houtte, Mons. E. Y. Teas, Baroness Rothschild, Le Havre, Alfred Colomb, Etienne Levet, and Duchess of Bedford. Mr. C. J. Salter (gardener to T. B. Haywood, Esq., Reigate) was second. His flowers were in good condition, but undersized throughout. The Rev. A. Foster Melliar, Sproughton Rectory, Ipswich, was third.

In class 8, twenty-four distinct, Mr. Walter Drew, Uplands, Ledbury, had the best of four stands, his varieties being as follows :—Back row : Général Jacqueminot (a grand flower), Merveille de Lyon, Lord Bacon, Her Majesty, Jean Soupert, François Michelin, Duke of Wellington, and La France. Middle row : Mrs. John Laing, A. K. Williams, G. Dickson, Prince Arthur, Marie Verdier, Duke of Teck, Madame G. Luizet, and Ulrich Brunner. Front row : Louis Van Houtte, Marquise de Castellane, Exposition de Brie, Heinrich Schultheis, Earl of Dufferin, Niphotos, Dupuy Jamain, and a charming lilac-pink sport unnamed. These were in excellent condition, and formed a strong stand. Mr. A. Hill Gray was second with smaller but very fresh flowers, and Mr. J. Gurney Fowler, Glebelands, Woodford, was third.

In class 9, sixteen distinct, three trusses of each, Mr. Lindsell scored another victory, his varieties being as follows—Back row : Chas. Lefebvre, Madame G. Luizet, Dupuy Jamain (splendid), La France, Ulrich Brunner, Niphotos, François Michelin, and Innocente Pirola. Front row : Madame Cusin, Exposition de Brie, Souvenir d'Elise Vardon, Prince Arthur, Caroline Kuster, Dr. Sewell, Mrs. John Laing, and Mons. E. Y. Teas. They were a very fine collection. Mr. Budd was second with smaller flowers, but equally good in other respects, and Mr. A. Slaughter, Steyning, was third. These were the only exhibitors. In class 10, twelve varieties, distinct, three trusses of each, first Mr. Walter Drew, Ledbury, with Ulrich Brunner, La France, Général Jacqueminot, Mrs. J. Laing, Duke of Teck, and a variety unnamed, apparently Marquise de Castellane, in the back row; Madame G. Luizet, A. K. Williams, J. Dickson, Comte de Raimbaud, Dupuy Jamain, and Duke of Edinburgh in the front row. Mr. J. Brown was second with a charmingly fresh stand, and the Rev. A. H. Berners, Harkstead Rectory, Ipswich, third. There were ten stands in all. In class 11, twelve single trusses of any H.P., there were no less than twelve boxes. The first prize went to Mr. J. Brown for a beautiful dozen of Mrs. John Laing, not large, but in superb condition. Mr. A. Hill Gray, Beaulieu, Bath, was second with a fine stand of La France, and Mr. S. P. Budd third with Ulrich Brunner, richly coloured, and very fresh.

Classes 12 to 16 inclusive were reserved for growers of less than 2000 plants. With twenty-four single trusses, distinct, there were three competitors. The Rev. W. J. Romaine, The Priory, Old Windsor, was first with the following varieties :—Back row : Countess of Oxford, Mrs. John Laing, Le Havre, Etienne Levet, Her Majesty, Earl of Dufferin, Marie Verdier, and a fine bloom of Ulrich Brunner. Middle row : Madame G. Luizet, Camille Bernardin, La France, Maréchal Niel, Louis Van Houtte, Comtesse de Nadaillac, Heinrich Schultheis, and Souvenir d'Elise Vardon. Front row : Madame Welche, A. K. Williams, Ethel Brownlow, Eclair, Madame Bravy, Suzanne Marie Rodocanachi, and Prince Arthur. These were somewhat uneven in merit, but formed a fairly strong stand. Mr. J. C. Tasker, Middleton Hall, Brentwood (gardener, Mr. J. Perry), was second with Magna Charta, The Bride, and Ulrich Brunner, very good. Mr. W. Narroway had only twenty-one

blooms in his stand or he would certainly have received a prize; as it was there was no other course than disqualification. There were four stands of eighteen distinct varieties, the winning one coming from Mr. E. M. Bethune, Denne Park, Horsham. He staged the following varieties :—Back row : Mrs. Baker, Duke of Edinburgh (a splendid bloom), La France (very fine), Chas. Darwin, Dupuy Jamain, and Marquise de Castellane. Middle row : Eugène Fürst, Madame Isaac Pereire, Sir Rowland Hill, Rosieriste Jacobs, Madame Gabriel Luizet, and Chas. Lefebvre. Front row : Alfred Colomb, Marie Finger, A. K. Williams, Mrs. John Laing, Marie Baumann, and Duchess of Bedford. These were larger, well formed, and very fresh flowers, forming a very fine stand. Mr. F. T. Baker, Holmfels, Reigate, was a good second, his Mrs. John Laing, Etienne Levet, and Madame G. Luizet being beautiful blooms. Mr. E. Mawley, Rosebank, Berkhamsted, was third with smaller but fresh flowers. In the class for twelve single trusses Mr. W. H. Fowler, Claremont, Taunton, had the best of three stands, his varieties being—Back row : Innocente Pirola, Comtesse de Nadaillac, Rubens, and Cleopatra. Middle row : Ernest Metz (a grand flower), Catherine Mermet, Souvenir d'Elise, and Princess of Wales. Front row : Madame Cusin, Niphotos, Francisca Krüger, and Anna Ollivier. Mr. F. Warde, West Malling, was second, and he had a grand Her Majesty, the third prize falling to Mr. E. Wilkins, Sutton. Class 15, eight distinct, three of each. Here Mr. Wilkins won well, his flowers being very fine. The varieties were Chas. Lefebvre, Madame G. Luizet, Ulrich Brunner, Earl of Dufferin, Le Havre, Maurice Bernardin, La France, and A. K. Williams. Mr. P. G. C. Burnand, Reigate, also had a beautiful stand, and was a highly creditable second; the third prize going to the Rev. W. J. Romaine. There were six stands in competition. For nine single trusses of any H.P., first Mr. E. M. Bethune with a fair stand of Madame G. Luizet, second and third Mr. Wilkins and the Rev. W. J. Romaine, both with the same variety. There were four stands in all.

Classes 17 to 20 inclusive were devoted to growers of less than 1000 plants. For twelve distinct, single trusses, first, Dr. Tucker, Swanley Junction, with a very good stand, his varieties being as follows :—Back row : Ulrich Brunner, Marquise de Castellane, Chas. Darwin, and Her Majesty. Middle row : Captain Christy, A. K. Williams, La France, and Abel Carrière. Front row : Dr. Hogg, Mrs. J. Laing, Duke of Edinburgh, and Etienne Levet. Mr. C. J. Grahame, Coombe Road, Croydon, was third with an excellent stand, and Mr. R. L. Knight, Bobbing, Sittingbourne, third. There were thirteen stands in all. The Rev. H. B. Biron was first with nine blooms, showing Chas. Lefebvre, Innocente Pirola, Ulrich Brunner, Madame G. Luizet (very beautiful), A. K. Williams, Duke of Wellington, Le Havre (very fine), Marie Finger, and Etienne Levet. The Rev. J. S. Taylor, Littleton Vicarage, Evesham, was a very good second, and Mr. C. E. Cuthell, Chapel Croft, Dorking, third. There were seven stands in this class. In class 19, six distinct, three trusses of each, Dr. Tucker had the best out of six stands, La France, A. K. Williams, Comtesse de Nadaillac, Dr. Hogg, Madame G. Luizet, and Abel Carrière representing him. They were small but otherwise good. Mr. O. G. Orpen, West Bergholt, Colchester, was a good second, and Mr. Cuthell third. For six single trusses of any H.P. : First, Dr. Tucker with Her Majesty, very large but somewhat coarse flowers. Second, Mr. Jas. Parker with Madame G. Luizet. Third, Mr. Grahame with Marie Baumann. There were eight stands.

Classes 21 to 23 inclusive were reserved for growers of less than 500 plants. For nine distinct, single trusses, Mr. H. Foster, Ashford, won with Etienne Levet, A. K. Williams, Dr. Bullion, Marie Baumann, Merveille de Lyon, Marie Rady, Madame G. Luizet, Marguerite Brassac, and Mrs. J. Laing. Mr. G. Moules, Hitchin, was second; and Mr. Rutter, Halliford, third. There were five stands. For six distinct, single trusses, Mr. E. Horne, Park House, Reigate, was a very good first with Ulrich Brunner, François Michelin, Marquise de Castellane, Chas. Lefebvre, Madame I. Pereire, and Madame G. Luizet. Mr. H. P. Landon, Brentwood, was second, with large but somewhat coarse flowers; and Mr. Hugh White, Highgate, third. There were seven stands. For four distinct, three trusses of each, Mr. Edward Horne won with La France, Chas. Lefebvre, Marie Baumann, and Madame Bravy. Second, Mr. E. B. Denton, Stevenage. Third, Mr. Crofts, gardener to W. D. Freshfield, Esq., Reigate. There were six stands.

Class 24, six single trusses, was only open to amateurs who have never won a prize at an exhibition of the N.R.S. There were thirteen stands. Mr. W. H. Fowler won with Ernest Metz, Souvenir d'Elise, Princess of Wales, Comtesse de Nadaillac, Cleopatra, and Catherine Mermet—a capital box. Mr. W. Hooper was second, and Mr. S. F. Francis, Orpington, third. For six distinct, single trusses, grown within eight miles of Charing Cross, Mr. R. H. Langton, Roymead, Hendon, was first with Captain Christy, Mrs. J. Laing, Duke of Edinburgh, La France, Souvenir de S.A. Prince, and Souvenir d'Elise Vardon. Mr. Walter Northover, Crouch End, was second, and Mr. J. Bateman, Highgate, third. There were five stands in all. With six new Roses, distinct, the Rev. J. H. Pemberton was first, staging Madame Caroline Testout, Gustave Piganeau, T. W. Girdlestone, Mrs. Wm. Watson, Augustine Guinnoisseau, and Jeannie Dickson. There was one other stand, which was disqualified through the inclusion of Cleopatra.

TEAS AND NOISETTES.

For twenty-four Teas or Noisettes, distinct, single trusses (nursery men), Mr. G. Prince, Oxford, was awarded first prize, showing a box of grand blooms, amongst which Madame Cusin and Innocente Pirola were particularly good. Mr. Frank Cant gained second, and Mr. B. R. Cant

third prize. For eighteen distinct, single trusses, Mr. John Mattock was placed first with a stand of even blooms, and Messrs. B. Prior and Sons were awarded second honours, the third prize falling to Messrs. Burrell & Co., Howe House Nurseries, Cambridge. Mr. Frank Cant was awarded first prize for twelve single trusses of any Tea or Noisette other than *Maréchal Niel*. This exhibitor staged a stand of beautifully fresh and even blooms of *Madame de Watteville*. Messrs. G. & W. Burch secured second place with *Niphetos*, and Mr. B. R. Cant was third with *Madame de Watteville*. Mr. G. Prince was awarded the first prize for eighteen Teas or Noisettes, three trusses of each, the blooms shown being fresh and even. Monsieur Furtado, *Madame de Watteville*, and Anna Ollivier were very good in this collection. Mr. J. Mattock, Oxford, was second, and the third prize went to Mr. Frank Cant. In each case the flowers were exceedingly good. Three blooms of *Souvenir de Thérèse Levet* in the second prize stand attracted some attention, the flowers being of very bright colour.

The best stand of eighteen Teas or Noisettes in the amateurs' section was staged by Mr. A. Hill Gray, Newbridge Hill, Bath, the blooms being remarkably fresh and even. The best varieties were *Catherine Mermet*, *The Bride*, *Cleopatra*, *Souvenir d'Elise Vardon*, *Jean Ducher*, and *Comtesse de Nadaillac*. The last named was a splendid bloom, and one of the best in the Show. The Society's champion challenge trophy was awarded for this stand. The Rev. F. R. Burnside, Birch Vicarage, Hereford, gained the second prize, and the Rev. H. Berners was third. Mr. W. H. Fowler staged the best twelve Teas or Noisettes, single trusses, amongst which *Madame de Watteville*, *Cleopatra*, *Madame Cusin*, *Ernest Metz*, *Prince of Wales*, and *Catherine Mermet* were very fine. Messrs. E. B. Lindsell and T. B. Haywood were awarded second and third prizes respectively. Mr. A. Hill Gray secured the first prize, and the Townsend-Boscawen Memorial plate for twelve Teas or Noisettes, distinct, three trusses of each. The best flowers in this stand were Anna Ollivier, *Souvenir de Thérèse Levet*, *Comtesse de Nadaillac*, and *Maréchal Niel*. The Rev. F. R. Burnside was second. The best stand of nine single trusses of Teas or Noisettes was shown by the Rev. H. Berners, the variety being *Innocente Pirola*. Mr. E. M. Bethune, Denne Park, Horsham, was second with *The Bride*, and Mr. E. B. Lindsell third.

Classes 35 to 38 inclusive were reserved for growers of less than 500 plants. Mr. O. G. Orpen was first with twelve single trusses, Mr. C. J. Grahame second, and the Rev. F. Page Roberts, Scole Rectory, third. There were six stands of nine single trusses, and Mr. E. Wilkins secured the premier award with some very fresh, neat flowers, Mr. Walter Drew and the Rev. W. J. Romaine being second and third. The best half dozen trebles came from Mr. Burnand, whose flowers, though somewhat small, were in perfect condition; the Rev. F. Page Roberts was second, and Mr. O. G. Orpen third. There were five other stands. Mr. Grahame had the best six of any Tea or Noisette, winning with a charming stand of *Mdme. Cusin*; Mr. Alfred Tate was second with *Souvenir d'Elise*, and the Rev. J. H. Pemberton third with *Madame Caroline Kuster*. There were eleven stands in competition.

Classes 39 and 40 were reserved for growers of less than 500 plants. There were eight stands of nine single trusses, Mr. E. Mawley winning with a very beautiful box, although the flowers were somewhat small; Dr. Tucker was second, and Mr. Freshfield third, four others showing. In class 40, six distinct varieties, there were twelve stands, the best coming from Miss Cuthbert. She had a splendid *Mdme. Cusin* in her box, and the remaining flowers were also good. The Rev. F. S. Taylor was second, and Mr. Cuthell third.

OPEN CLASSES.

For twelve single trusses of any yellow variety except *Maréchal Niel*, Mr. G. Prince, Oxford, was placed first. He had an excellent box of *Comtesse de Nadaillac*; Mr. Mattock was second with *Amazone*, and Mr. Frank Cant third with *Madame C. Kuster*. There were six stands altogether. For twelve of any white except *Niphetos* Mr. Frank Cant was first with a beautiful box of *The Bride*, the Rev. F. R. Burnside being second with *Innocente Pirola*, and Mr. J. Mattock third with *Rubens*. There were nine other stands. For twelve of any crimson except *Marie Baumann* or *A. K. Williams* Mr. B. R. Cant was first with a grand box of *Dupuy Jamain*, Mr. Mount second with *Ulrich Brunner*, and Messrs. G. Cooling & Sons third with *Fisher Holmes*. There were eight stands in all. For twelve of any dark velvety crimson Mr. G. Mount was first with a good box of *Fisher Holmes*, Messrs. Cooling & Sons second with *Abel Carrière*, and Mr. B. R. Cant third with *Duke of Edinburgh*; two others competing. Mr. A. Hill Gray had the best twelve of *Maréchal Niel*, an excellent dozen, Mr. Frank Cant second, and Mr. G. Mount third. There were two other stands. Mr. Mount had the best *Marie Baumann* (a fine box), Mr. B. R. Cant second, and Messrs. Hugh Low & Co. third. These were the only exhibitors. Mr. Frank Cant won with twelve of Mrs. John Laing, having a grand dozen, Mr. B. R. Cant second, and Messrs. D. Prior & Sons third. There were ten stands of this popular variety. The best twelve of *A. K. Williams* came from Mr. B. R. Cant, Messrs. Paul & Sons, Cheshunt, second, and the English Fruit and Rose Company, Limited, third. There were five other boxes. Messrs. Keynes, Williams & Co., Salisbury, won with *Niphetos*, having a delightful box of their climbing form. Messrs. G. & W. H. Burch, Peterborough, were second, and Mr. Frank Cant third. There were twelve stands in all. Mr. Frank Cant won with *Her Majesty*; Messrs. Paul & Son, Cheshunt, second. For twelve of any H.P. not named in the schedule Mr. B. R. Cant was first with a beautiful box of *Madame G. Luizet*, Mr. C. Turner second with the same variety,

and Messrs. Prior & Son third with *La France*, there being eighteen more stands. For six single trusses of *The Bride* and six of *Catherine Mermet*, to be arranged alternately, Mr. G. Prince was first, Mr. Frank Cant second, and Mr. A. Hill Gray third. There were nine boxes of these in all.

For twelve blooms of any new Rose Mr. B. R. Cant was first with a fine box of *Gustave Piganeau*. The second prize went to a delightful dozen of the beautiful *Bourbon Mrs. Paul*, presumably from Messrs. Paul & Son, though the card was not discoverable; and Mr. Frank Cant third with *Gustave Piganeau*, little inferior to the first prize box. There were seven stands. There were only two stands of twelve new varieties, Messrs. Paul & Son, Cheshunt, being first with *Marchioness of Dufferin*, *Marie Margot*, *Mrs. Paul*, T. W. Girdlestone, *Gustave Piganeau*, *Elise Fugiere*, *Violet Queen*, *Madame Caroline Testout*, *Augustine Guinnois-seau*, *Salamander*, *Gustave Regis*, and *Margaret Dickson*. Mr. Frank Cant was second. Amongst the new seedlings were *Henry Gow* (Star of Waltham x *President Leon de St. Jean*), a rich crimson H.P., from Mr. G. B. Baskett, The Gardens, Eashing Park, Godalming; H.P. Spenser, soft pink; *Tea Corinna*, and H.T. *Lady H. Grosvenor*, from Messrs. W. Paul & Son, Waltham Cross; *Capt. Hawyard*, a new rich crimson of good form, from Mr. E. Bennett, Chigwell; *Clara Watson*, a blush variety of good form, from Mr. Prince; and *Mrs. W. J. Grant*, from Messrs. A. Dickson & Sons, Newtownards, bright rose with shelly petals.

Messrs. Paul & Sons, the Old Nurseries, Cheshunt, won with thirty-six bunches of garden Roses. They had a delightful collection which evoked much admiration. Messrs. G. Cooling & Sons were second, and Mr. E. F. Such third. In the amateurs' class for eighteen Mr. Cuthell won with a very beautiful stand, the Rev. J. H. Pemberton being second, and Miss Mellish, Worksop, third. Mr. J. Mattock won with clusters of buttonhole flowers, followed by Mr. Alfred Evans and Mr. Frank Cant. Mr. Cuthell appeared to be the only exhibitor of single Roses, and was placed first.

THE PREMIER BLOOMS.

The premier H.P. in the nurserymen's section was a magnificent example of *Gustave Piganeau* exhibited by Mr. B. R. Cant, and the best Tea was a grand bloom of *Souvenir d'Elise Vardon* from the same exhibitor. Mr. E. B. Lindsell, Bearton, Hitchin, secured the silver medal for the best Hybrid Perpetual in the amateurs' section with a noble specimen of *Dupuy Jamain*. The best Tea or Noisette in this section was a massive bloom of *Souvenir d'Elise Vardon*, shown by Mr. Alfred Tate, Downside, Leatherhead.

MISCELLANEOUS EXHIBITS.

Messrs. W. Paul & Son had a magnificent group not for competition. In the centre was a number of standard *Polyantha* Roses, with Ferns and cut blooms interspersed. On the right and left were Roses in pots, together with numerous boxes and baskets of cut blooms, Ferns and foliage plants being arranged here and there. A beautiful box of *White Lady* was very noticeable, and so was a basket of the fine Tea *The Queen*. The new climbing Tea *Princess May* is delightful in colour and perfume. Messrs. J. Cheal & Son had a brilliant collection of Roses, herbaceous flowers, and Violas. Messrs. Carter & Co. had a table of Cacti and succulent plants, large and representative in character, which attracted much attention. Messrs. J. Laing & Son had a delightful display of hardy flowers, one of the best they have ever arranged, which is high praise. They also had a large and beautiful group of *Begonias*, *Orchids*, and other flowering and foliage plants, with several boxes of Roses in front. Messrs. J. Peed & Son had some splendid *Caladiums*, large, well grown, and finely coloured plants, giving an imposing effect. Messrs. Barr & Son had a long table of hardy flowers very attractively furnished. Messrs. J. Veitch & Sons contributed several boxes of cut Roses, including some very fine blooms, especially *Vicomtesse Folkestone*, *Sir Rowland Hill*, and a beautiful lustrous rosy pink named *Caroline d'Arden*. Lord Penzance had a beautiful display of his ennobled *Briars*. Messrs. H. Cannell and Sons staged a collection of *Begonia* blooms tastefully arranged with *Maidenhair Fern*.

INTERNATIONAL HORTICULTURAL EXHIBITION.—JULY 5TH.

WITHOUT going so far as to say that the Rose Show at the International Horticultural Exhibition justified the claim made for it in advance that it would be the most remarkable display of Roses ever held, it must be conceded that it was one of great beauty and diversity. Roses were largely and well shown, while *Begonias*, hardy herbaceous flowers, decorated tables, and a great number of miscellaneous exhibits swelled its extent and effect. It was held in the two Exhibition annexes in the western gardens, and these formed a brilliant spectacle. So far as the quality of the Roses was concerned most good judges who were present at both Exhibitions will no doubt agree that it was in advance of the National Rose Society's Show. The leading stands were somewhat heavier throughout. Evidently the extra time had benefited them.

The principal trade class was that for seventy-two blooms, distinct, single trusses, and in this Mr. Frank Cant, Braiswick Nursery, Colchester, followed up his success at the Palace with a brilliant victory. He had an extremely strong stand, his blooms being large, fresh, and well finished. *Gustave Piganeau* was a magnificent example, while *Le Havre* was also grand. Other fine flowers were *Comtesse de Nadaillac*, *Suzanne Marie Rodocanachi*, *Innocente Pirola*, *Cleopatra*, *Mdme. Hippolyte Jamain*, *Comte de Raimbaud*, *Sir Rowland Hill*, *Etienne Levet* (superb), *A. K. Williams*, *Niphetos*, and *Horace Vernet*.

This appeared to be several points stronger than Mr. Cant's Palace stand. Mr. B. R. Cant was second, but he was further in the rear than at the other Exhibition. His best flowers were Gustave Piganeau, Mdme. de Watteville, Niphetos, Comte de Raimbaud, Her Majesty, La France, A. K. Williams, Le Havre, and The Bride. The flowers were a shade past their best. Messrs. Paul & Son, Cheshunt, were third. With thirty-six blooms the position of the Colchester exhibitors was reversed, Mr. B. R. Cant being first and Mr. Frank Cant second. There were not many points between them, and the blooms throughout were of medium merit. Mr. G. Prince, Market Street, Oxford, was third with smaller but fresh flowers. Mr. Chas. Turner won with twenty-four blooms, distinct, having an excellent stand with Her Majesty, Earl of Pembroke, Maurice Bernardin, and Abel Carrière very good. Messrs. G. and W. H. Burch were second with a delightfully fresh stand, and Messrs. Keynes, Williams & Co. third.

Mr. B. R. Cant won with forty-eight trebles, staging a really grand collection. There was hardly a bad bloom in the stand, and many were very good, notably Le Havre, Horace Vernet, Niphetos, Alfred Colomb, Madame de Watteville, Lady Mary Fitzwilliam, and Souvenir d'Elise. Messrs. Paul & Son, Cheshunt, were second with smaller, but fresh, well coloured flowers. Mr. Frank Cant won with twenty-four trebles, Her Majesty, Madame Cusin, Marie Baumann, and Ernest Metz being good. Mr. Chas. Turner was second, and Mr. George Prince third.

In the amateurs' section Mr. Lindsell had some grand blooms. His winning stand of eighteen trebles was a beautiful one, La France, Madame de Watteville, Her Majesty, and François Michelin being exceptionally fine. The Rev. J. H. Pemberton was second, and Mr. Henry O. Machin third. Mr. Lindsell also won with forty-eight singles, and here he had a superb stand, perhaps one of the best he has ever arranged. In freshness, finish, and lustrous colour the blooms were almost perfect. Particularly fine were Ulrich Brunner, Souvenir d'Elise, Horace Vernet, A. K. Williams, Dr. Andry, Madame de Watteville, Her Majesty (small, but very beautiful), and The Bride. The Rev. J. H. Pemberton followed at a considerable distance, but with a bright, fresh stand, and Mr. Machin was third. Mr. R. L. Knight had a very good stand of eighteen singles, although there were one or two weak flowers, and secured the premier award, the second going to Mr. P. Perry, gardener to J. C. Tasker, Esq., and the third to Mr. J. Bateman, Highgate.

Teas and Noisettes were excellent. Mr. B. R. Cant won with twenty-four, and though not large they were in excellent condition. Niphetos, Souvenir d'Elise, Devoniensis, and Cleopatra were very good. Mr. Frank Cant was a close second, his flowers, however, being a trifle too old; and Mr. G. Prince third. Mr. Mount won with eighteen—a moderately good stand; Mr. G. W. Piper being second with smaller but very fresh flowers; and Messrs. Paul & Son, Cheshunt, third. The best stand of twelve of any Tea came from Messrs. Keynes, Williams, & Co., who were represented by Niphetos; Mr. B. R. Cant was second with Madame de Watteville; and Mr. Prince third with Comtesse de Nadaillac. Mr. Frank Cant won with eighteen trebles, a charming stand; Mr. Prince was second, and Mr. Mount third.

In the amateurs' section Mr. Lindsell staged a magnificent stand of eighteen singles, the blooms being perfect in colour and freshness. It is a pleasure to see such a stand. The flowers were so even in merit that particularisation was difficult. The Rev. J. H. Pemberton also had an excellent stand, and was placed second, while Mr. Machin came third. Mr. Knight won with twelve blooms. Mr. B. R. Cant showed a charming stand of Innocente Pirola in the class for twelve of any one Tea, and was placed first, Mr. Frank Cant being second with Madame de Watteville, and Mr. Prince third with Maréchal Niel.

Messrs. Paul & Son were first with garden Roses, and Mr. E. F. Such second. For twelve of any H.P. Messrs. Perkins & Son were first with a splendid box of Lady Mary Fitzwilliam, Mr. Turner second with A. K. Williams, and Mr. B. R. Cant third with Gustave Piganeau. Messrs. W. Paul & Son, Waltham Cross, were first for three of any new seedling with Corinna, and Messrs. Paul & Son, Cheshunt, second with Paul's Early Blush. For nine of any Tea introduced since 1889 Mr. G. Prince was first with Souvenir de S. A. Prince, and Messrs. Paul & Son, Cheshunt, second with Ernest Metz.

The general exhibits were very numerous. The tables were very beautifully furnished, the first prize one being that of Mr. Sydney T. Spalding, and the second that of Mrs. Helen Butt. Messrs. Perkins and Sons were victorious both with bouquets and baskets, which were arranged in their usual tasteful style. With stands or vases Mr. J. R. Chard showed the most conspicuously. Mr. T. S. Ware was placed first for a collection of hardy flowers, having one of his strongest displays. Messrs. Barr & Son were second, and Messrs. Paul & Son, Cheshunt, third. Mr. C. Gibson won with twelve bunches of perennials in the amateurs' section, and Mr. Sage, gardener to the Earl of Dysart, was first with eighteen. A silver medal was awarded to Messrs. W. Peed and Son for their fine Caladiums, and a silver-gilt medal for Sarracenias, while they received second prize for Gloxinias.

Near the West Brompton entrance Messrs. Sander & Co. had arranged a large and beautiful collection of Orchids, and amongst the interesting things included in it were *Cypripedium Wallisi*, *Epidendrum alatum*, *Cypripedium Curtisi* (a remarkably handsome species), *Odontoglossum Bleui* splendidissimum, splendidly flowered plants of *Cypripedium superbiens*, *Vanda Sanderiana*, many fine varieties of *Miltonia vexillaria*, *Cattleya gigas Sanderiana* (a fine variety), *Cattleya du Buyssoniana*, and *Sobralia lutescens*. Messrs. Kelway & Son received a silver-gilt medal for a magnificent collection of Delphiniums, also Gaillardias,

Irises, and other hardy flowers. Messrs. Wills & Segar showed Palms. Messrs. J. Laing & Son had a bright display of hardy flowers and several stands of Roses, receiving a silver-gilt medal. Messrs. W. Cutbush & Son had a collection of Crotons, Dracenas, and other plants. Messrs. Cannell & Sons exhibited a collection of Begonias, cut blooms, arranged in bunches and set off with Fern, which were very attractive, and merited the silver-gilt medal awarded. M. Ed. Pynaert Van Geert exhibited a remarkable plant of *Sobralia macrantha nana*, 6 feet in diameter, very healthy, and freely flowered. A silver-gilt medal was awarded. Mr. C. Turner showed a new Delphinium named Moonstone, pale blue with mauve shading. Messrs. E. D. Shuttleworth & Co. had several groups of foliage plants. In the trade class for table plants Messrs. Peed won, and in that for amateurs Mr. C. Lane was successful.

Two splendid groups of Tuberous Begonias were in competition, one coming from Mr. T. S. Ware and the other from Messrs. J. Laing & Son. They were essentially different in character, the former being superior in arrangement, the latter in quality of bloom. Opinions differed as to which was the better of the two, but the decision of the Judges was in favour of Mr. Ware. Messrs. Laing & Son were placed first for a collection of foliage Begonias.

Fruit was not very largely shown, but it was very good. Mr. G. Thompson, gardener to Messrs. W. & E. Wells, won with Grapes. Messrs. Taverner & Bowerman following. Mr. A. Gibson, gardener to T. F. Burnaby Atkins, Esq., won with three dishes of Strawberries, and Mr. Divers with one dish. The latter won with Peaches and Mr. W. Robins with Nectarines, other prizes in these classes going to Messrs. Sage, J. Gibson, Ocock, P. Blair, and G. R. Allis. A gold medal was awarded to Messrs. Parsons & Bourgaize, Covent Garden, for a collection of market fruit, and a silver-gilt medal to Mr. F. Le Poidevin, Guernsey, for a similar display. The latter had some good Grapes and Figs. The first prize for a collection of twelve dishes of fruit fell to Mr. W. Robins, gardener to Colonel Lee, and that for six dishes to Mr. A. Ocock, gardener to Mrs. McIntosh. In the special Grape classes Messrs. Thompson and Bowerman distinguished themselves, the former with a magnificent bunch of Madresfield Court, the latter with a fine cluster of Buckland Sweetwater. Messrs. Osman and Taverner also exhibited good bunches. Mr. W. Allan, Gunton Park Gardens, sent several fine boxes of Strawberries, including the three seedlings Lord Suffield, a conical medium sized very dark fruit; Gunton Park, very large, wedge shaped, and dark crimson; and Empress of India, a bright scarlet conical fruit.

Outside the annexes Messrs. W. Paul & Son, Waltham Cross, exhibited a most extensive and beautiful collection of Roses, comprising about 10,000 blooms. It richly merited the gold medal that was awarded.

IPSWICH.—JUNE 29TH.

It was not my first introduction to East Anglia by any means, for many years ago, long before I had become so enamoured of the Rose, I had been there. I had been there, too, in days when Rose amateurs were few, and, under the guidance of my friend Mr. Ben Cant, had visited good old Mr. Hedge of Reed Hall, who was then *facile princeps* as a Rose grower. I had since then also been with him to see his world-renowned nursery, but it was my first visit as a Judge; and certainly a rougher welcome, as far as weather was concerned, I could not possibly have had, for on the Tuesday night previous to the Show there was the most terrific thunderstorm I think I ever witnessed. The day had been fine, and we were all saying Ipswich will not share its usual fate—a wet day, when ominous clouds gathered in the west, opposite to where the wind was, and about nine o'clock it came with full force. I never remember seeing such vivid and prolonged lightning; the rain came down in torrents, and one felt that if any exhibitors had been deluded enough to wait until the morning to cut their blooms it was all up with them. Wednesday was not a wet day, but excepting that it was about as miserable a day as it was possible to conceive for a flower show. It was cold, dark, and dreary; it drizzled at times, and I fear the takings at the gate were an evidence of this; but, on the other hand, there was a bright and cheerful scene within the tents, forming a pleasing contrast to that without.

The Exhibition was held in spacious tents erected in the beautiful grounds of Christ Church House, close to the town and next to the arboretum. It is very rarely that so large a town as Ipswich has so grand a park close to it with a fine old house of Elizabethan and Jacobean architecture, and containing some magnificent timber. It has been offered to the town, and it may be hoped that it will not be permitted to pass into the jerry builder's hand and be cut up into "eligible plots for building purposes," as has been the case with so many fine old places, especially when they have been contiguous to towns. It was on this occasion kindly lent by the owner, J. S. Fergusson, Esq., and a more beautiful spot for an exhibition could not well be found.

The Roses of East Anglia have long been famous. Mr. Ben Cant, the oldest exhibitor, if not grower, of cut flowers in England, long ago made it famous, and of later years Mr. F. Cant has added to it, while in Tea Roses the noble army of parsons have established and maintained its reputation as one of the most favoured spots in England, although some of them have suffered terribly by these last two winters, notably Mr. Page Roberts, who has been completely placed *hors de combat* through his excessive losses, consequently one was prepared to see a good display of that lovely class. Nor were one's expectations disappointed. A most lovely clean and well-developed set of flowers was displayed, added to by those of the Rev. F. R. Burnside, who travelled all night across England "to beard the lion in his den, the Douglas in his hall," a feat which he accomplished successfully by taking off the first prize in the class for eighteens.

In the class for forty-eight Mr. Frank Cant was first with a collection of bright well-grown Roses, comprising Countess of Oxford, Catherine Mermet, Charles Lefebvre, Marie Finger, Comte de Paris, Souvenir d'un Ami, François Michelin, The Bride, Horace Vernet, Elise Vardon, Etienne Levet, Madame de Watteville, Lady Helen Stewart, Lady M. Fitzwilliam, Duke of Edinburgh, Heinrich Schultheis, La France, Exposition de Brie, Marie Van Houtte, Beauty of Waltham, Jeannie Dickson, Général Jacqueminot, Vicomtesse Folkestone, Prince Arthur, Augustine Guinoisseau, Duke of Teck, Innocente Pirola, Marie Susanne Rodocanachi, Madame Cusin, Marie Rady, Her Majesty, Charles Lamb, Marguerite Dickson, E. Y. Teas, Caroline Kuster, Antoine Ducher, Ernest Metz, Pride of Waltham, Cleopatra, A. K. Williams, Marie Cointet, Dupuy Jamain, Marguerite St. Armand, Camille Bernardin, Hon. Edith Gifford, Duke of Connaught, Madame Gabriel Luizet. Mr. Benjamin Cant was second. In the class for thirty-six distinct Messrs. Prior & Sons, Colchester, were first with Lady M. Fitzwilliam, Alphonse Soupert, Marie Van Houtte, Reine Marie Henriette, Mons. Noman, Auguste Piganeau, La France, A. K. Williams, Mrs. J. Laing, Duke of Edinburgh, Baroness Rothschild, Mary Bennett, Catherine Mermet, Constantin Fretiakoff, Merveille de Lyon, Abel Carrière, Anna Ollivier, Heinrich Schultheis, Jean Ducher, Prince Arthur, Madame G. Luizet, Boieldieu, Maréchal Niel, Ulrich Brunner, Souvenir d'Elise, Alfred Colomb, Niphotos, Charles Darwin, Caroline Kuster, Duchesse de Morny, Captain Christy, Madame Lambard, Countess of Rosebery, Marie Finger, Edith Gifford, and Countess of Pembroke. Mr. Burrell of Cambridge was second with a good stand. In the class for twelve trebles Mr. F. Cant was again first with some of the best varieties named in his forty-eights. Mr. B. R. Cant was second, and Prior & Son third. In the class for eighteen Teas Mr. Frank Cant was again first with Madame de Watteville, The Bride, Madame Cusin, Maréchal Niel, Catherine Mermet, Souvenir d'Elise Vardon, Souvenir d'un Ami, Souvenir de S. A. Prince, Perle des Jardins, Innocente Pirola, Marie Van Houtte, Ernest Metz, Francisca Kruger, Princess of Wales, Cleopatra, Hon. Edith Gifford, Caroline Kuster, and Anna Ollivier. Mr. G. Prince, was second, and Messrs. Prior and Sons third, and in this box was one of the finest blooms of Marie Van Houtte ever exhibited.

In the amateur classes, in that for thirty-six, the Rev. H. A. Berners was first with an excellent stand. In the class for twenty-four, Mr. J. Gurney Fowler, Glebeland, Woodford, Essex, was first with Duke of Teck, Her Majesty, Duke of Edinburgh, Ulrich Brunner, Countess of Oxford, Pride of Waltham, Dr. Andry, A. K. Williams, Mrs. J. Laing, Rossieriste Jacobs, Charles Lefebvre, La France, Marie Rady, Duchesse de Morny, Etienne Levet, Vicomtesse Folkestone, Pride of Reigate, Catherine Mermet, Marie Baumann, Hon. E. Gifford, Dr. Sewell, Marquise de Castellane, Jean Ducher, Comte Raimbaud. Mr. O. G. Orpen, West Bergholt, Colchester, was second, and the Rev. A. Foster-Melliar, Sproughton Rectory, third.

In the class for eighteen Teas the Rev. F. R. Burnside was first with Souvenir d'Elise, Mad. Cusin, Comtesse de Nadaillac, Princess of Wales, Catherine Mermet, Hon. Edith Gifford, The Bride, Marie Van Houtte, Souvenir de Paul Ncyron, Caroline Kuster, Rubens, Niphotos, Souvenir de Thérèse Levet, Francisca Kruger, Souvenir d'un Ami, Mad. Bravy, Ethel Brownlow; the Rev. H. A. Berners was second, and Mr. O. G. Orpen third. In twelve trebles the Rev. H. A. Berners was first with Maréchal Niel, Anna Ollivier, Innocente Pirola, Mad. Bravy, Comtesse de Nadaillac, Mad. Hoste, Hon. Edith Gifford, Jean Ducher, Catherine Mermet, Princess of Wales, Francisca Kruger, The Bride. The Rev. F. R. Burnside was second, and Mr. O. G. Orpen third. In the class for twelve of one variety the Rev. A. Foster-Melliar was first with Anna Ollivier; Mr. J. Gurney Fowler was second, and the Rev. H. A. Berners third. In the class for twelve distinct Mr. J. Fowler was first, Mr. O. G. Orpen second, and the Rev. A. Foster-Melliar third. The silver medals of the National Rose Society were awarded to the Rev. H. A. Berners for Cleopatra as the best Tea in the amateur classes, a very grand bloom, and to Mr. O. G. Orpen for the best Hybrid Perpetual.

All the arrangements of the Show were carried out in an excellent manner, and great credit is due to the Rev. H. A. Berners for this, and that in despite of the adverse circumstances already alluded to, it was, to me, a great matter of regret that the storm of Tuesday had so ruined the garden of Mr. Berners that a visit to it, which had been arranged, had to be abandoned. Another matter of regret was that the Rev. F. Pag-Roberts, so well known as a successful grower of Tea Roses, had suffered such severe losses in his plants during the last two winters that he was quite unable to put in an appearance; in person he was there, but his Roses were absent.

Amongst the other attractions of the Show was a beautiful bank of flowers of herbaceous plants, the finest being those exhibited by Mr. J. Burrell of Cambridge. The bright colours and varied hues of these flowers attracted general admiration; orange white and yellow Iceland Poppies, blue Delphiniums, white Campanulas, scarlet Lychnis, and a host of intermediate shades of colour combined to make a most attractive picture, and showed, at any rate, that East Anglia is not behind in the movement, made of late years, to encourage the growth of these plants.—D., Deal.

ELTHAM.

ONCE more in this charming spot, the very beau ideal of a place for a Rose show, and in the most delightful weather, there were gathered together not only a very good collection of Roses, but also greenhouse plants, table decorations, fruits and vegetables and cottagers' productions, many of which deserve more than a mere passing notice. I

have often noticed how delightful are the decorations exhibited here, and the present year fully maintained this character. They were light and artistic, and fully deserved the encomiums passed on them, although as usual there was a wide difference of opinion as to the correctness of the Judges' decisions, and I do not see how it is ever to be otherwise. It is simply a matter of taste; some like gracefulness and elegance, others massiveness. I do not think that anybody expected so good an exhibition, for the season had been a very eccentric one to say the least, and yet flowers of great brilliancy as well as of delicate shades were to be seen. One very noticeable fact was the progress that had been made by the local growers. I remember when it used to be said—first, and the rest nowhere; but now several of those who were amongst the latter have advanced to a position of great excellence, and many of the stands exhibited did great credit to the growers, and this is one of the best results of such exhibitions—they stimulate further exertions. A man has been content with what he has seen in his own garden, he thinks that they are quite as good as anyone could grow; he goes to an exhibition and comes back with a very different story. He sets to work, adds to his marks, reads books, consults his neighbours, and as a consequence takes a higher position. There are persons who very much

FIG. 3.—CATTLEYA IRICOLOR. (See page 4.)

dislike exhibitions. Their reasons are various; but the advantages and ultimate results I think far outweigh any supposed disadvantages.

I commence with the amateurs, to whom at Eltham is given the post of honour—a very desirable practice, for assuredly it is the amateur element which is most to be cherished. Professional growers can take care of themselves, and the National Rose Society has always held to the theory and practice, and has consequently made such a schedule for amateurs as has never before been attempted. Of course there is a reflex benefit on the professional side, for the more enthusiastic the amateur becomes the larger are the orders sent to the nurserymen.

In the class for eighteen distinct varieties Mr. Shea was first with Madame G. Luizet, Sultan of Zanzibar, Duke of Teck, Marie Finger, Innocente Pirola, Mrs. J. Laing, Prince Arthur, Countess of Oxford, Caroline Kuster, Ulrich Brunner, Magna Charta, Luciole, Pride of Waltham, Souvenir de S. A. Prince, Vicomtesse Folkestone, Duke of Edinburgh, and Suzanne Marie Rodocanachi. Mr. A. Harris was second, and Mr. R. Bloxham third. In the class for twelve varieties Mr. Arthur Bryans was first with Ulrich Brunner, Merveille de Lyon, Duke of Teck, Captain Christy, Baroness Rothschild, Souvenir de Thérèse Levet, Louis Van Houtte, Mrs. J. Laing, Countess of Oxford, Vicomtesse Folkestone, Duchess of Bedford, Marie Baumann. Mr. Shea was second, and Rev. J. N. Rowsell third. In four trebles Mr. Bloxham was first with Vicomtesse Folkestone, La France, Madame Gabriel Luizet, Eugène Verdier; and Mr. A. Harris third. In the class for six varieties Mr. A. Bryans was first with Baroness Rothschild, Countess of Oxford, Benoit Comte, Abel Carrière, A. K. Williams, Heinrich Schultheis. Mr. Summers second, and Mr. Massey third.

In the class for six Teas Mr. Rowsell was first with Etoile de Lyon, Jules Finger, Vicomtesse Folkestone, Jean Ducher, Ethel Brownlow, Madame Margottin; and Mr. A. Bryans second. In the class for six of one variety Mr. Shea was first with Marie Finger, Mr. Bloxham second with Vicomtesse Folkestone, and Mr. Bryans third.

In the classes for nurserymen Mr. Frank Cant was first in that for forty-eight varieties with Sultan of Zanzibar, Vicomtesse Folkestone, Dr. Sewell, Merveille de Lyon, Antoine Ducher, Lady Mary Fitzwilliam,

Ulrich Brunner, Madame de Watteville, Victor Hugo, Mons. H. Jamain, Duchess of Bedford, Madame Cusin, Dupuy Jamain, Niphetos, Prince Arthur, Baroness Rothschild, Auguste Piganeau, Grace Darling, Marguerite de St. Amand, Pride of Waltham, Auguste Rigotard, Madame G. Luizet, Madame T. Pereire, Mrs. J. Laing, François Michelon, Mrs. Paul, Duchess of Teck, Marie Finger, Marie Baumann, Souvenir d'Elise, Pride of Reigate, The Bride, Duke of Wellington, Jeannie Dickson, Victor Jacqueminot, Catherine Mermet, Exposition de Brie, La France, Comtesse de Ludre, Souvenir d'un Ami, Charles Lefebvre, Madame Dubois, Alfred Colomb, Innocente Pirola, Victor Verdier, A. K. Williams, Madame Willermoz. Messrs. Prior & Son were second, and Mr. Geo. Prince was third. In the class for twelve varieties Messrs. Prior & Sons were first with Eugène Verdier, Dr. Sewell, Lady Mary Fitzwilliam, Ulrich Brunner, Marie Baumann, Merveille de Lyon, Dupuy Jamain, Marie Van Houtte, Madame Gabriel Luizet, A. K. Williams, The Bride, Boieldieu; Mr. Frank Cant was second, and Mr. George Prince third.

In the class for twelve Teas Mr. George Prince was first with The Bride, Comtesse de Nadaillac, Hon. Edith Gifford, Catherine Mermet, Ernest Metz, Innocente Pirola, Maréchal Niel, Princess of Wales, Souvenir de S. A. Prince, Souvenir d'un Ami, Anna Ollivier, Madame Hoste; Mr. Frank Cant was second, and Messrs. Prior & Son third. In the class for twelve, six H.P. and six Teas, the first prize was awarded to a stand containing Caroline Kuster, Souvenir d'un Ami, Madame Cusin, Anna Ollivier, Marie Van Houtte, Jean Ducher, Lady Mary Fitzwilliam, Prince Arthur, Alphonse Soupert, Madame Gabriel Luizet, Captain Christy, Ferdinand de Lesseps, but of which I omitted to take the name of the exhibitor. The second was awarded to Mr. R. Bloxham. In the class for twelve Teas (amateurs) the Rev. F. R. Burnside took first prize with Souvenir d'Elise, Princess of Wales, Innocente Pirola, Marie Finger, Souvenir d'un Ami, Comtesse de Nadaillac, Catherine Mermet, Souvenir de Paul Neyron, Rubens, Ethel Brownlow, The Bride, and Caroline Kuster. This stand contained some remarkably fine blooms, and it was a noteworthy fact, as showing the staying power of Teas, that they had all been exhibited the day before at Ipswich. Mr. R. Bloxham was second in this class. The National Rose Society's medal for the best Hybrid Perpetual was given to a bloom of Etienne Levet (?) in Mr. Shea's box, that for the best Tea to a small, but pretty, bloom of Jean Ducher in Mr. Rowsell's box.—D., Deal.

CANTERBURY.—JUNE 30TH.

THE rosarian would be difficult to please indeed who did not find pleasure in a visit to Canterbury. The town has features of interest that many of much greater size do not possess. The Show is an excellent one, and those connected with it are found to be as courteous and pleasant as they are well versed in Rose matters. Prominent amongst them, and best known perhaps to rosarians in general, is the Rev. H. B. Biron, who, as one of the Secretaries, does much to guide the course of the Society. He is an able grower, and takes a deep interest in the flowers, as might be gathered from his recent letters on faded Roses in the Journal. Into the merits of the discussion on this subject it is not now necessary to enter; it is more to the point to consider those of the Show which he directs. Considering the season, it was a highly satisfactory one, the entries being much more numerous than might have been expected. The flowers, too, were excellent. Mr. Wachter, Colonel Pitt, and Mr. Biron all showed good blooms, and some admirable flowers also came from Mr. J. Stonley. This exhibitor would not be defeated without a struggle at some of the leading shows.

There were four stands of eighteen blooms, and amongst them were some excellent flowers. Mr. Cooper Wachter of Hoath was first with an admirable stand, consisting of Etienne Levet, Marie Finger, Etoile de Lyon, Mrs. John Laing, Dupuy Jamain, Mdme. Gabriel Luizet, Général Jacqueminot, Ulrich Brunner, Catherine Mermet, Le Havre (very fine), Hon. Edith Gifford, Dr. Andry, Marie Baumann, Innocente Pirola, A. K. Williams, Maréchal Niel, Marie Rady, and Madame Cusin. These were a large, fresh, and well-coloured collection, one Tea only being a little tarnished. Mr. R. L. Knight was second, and although a good many points in the rear he had a creditable stand. He had a charming bloom of Mdme. Gabriel Luizet. Colonel Pitt was third, his stand being good but lacking diversity. There were six stands of twelve, and a delightful one from the Rev. H. B. Biron was placed first. None of the flowers was large, but all were in admirable condition. A splendid bloom of Innocente Pirola was the best flower in the stand, while Marie Finger and Dupuy Jamain were very good. The second prize went to Mr. H. Foster for a very bright and fresh collection, Captain Christy being third. His flowers were large, but some a little faded.

Teas and Noisettes were neat and fresh, if not large. Colonel Pitt had a beautiful stand, only lacking size. The varieties were Caroline Kuster, The Bride, Anna Ollivier, Madame de Watteville, Cleopatra, Catherine Mermet, Madame Cusin, Hon. Edith Gifford, Souvenir d'Elise, Mdme. Bravy, Maréchal Niel, and Marie Van Houtte. Mr. R. L. Knight was second with a stand of medium quality, and the Rev. J. R. Buchanan third. The Rev. H. B. Biron had the best six trebles, staging Duke of Edinburgh, Madame de Watteville, Dr. Andry, Marquise de Castellane, Chas. Lefebvre, and Marie Cointet. The latter was undersized, and Charles Lefebvre rather tarnished, but the others were good. Mr. Knight was a close second, though his flowers were somewhat small, and Colonel Pitt third. There were two other stands. Six competed with twelve blooms, and the best stand was that of Mr. J. Stonley, Harbledown, who staged some excellent flowers. His Merveille de Lyon, Mrs. John Laing, Marie Baumann, and Alfred Colomb were very good indeed; taking all

points into consideration, this was one of the best stands in the Show. Mr. F. Honeyball was second with smaller, but very fresh, well coloured flowers, Mr. S. H. Dean and Captain Lambert being placed equal third. The latter had very good blooms of Cleopatra, and Madame Gabriel Luizet, but his stand was marred by one or two very small flowers. Mr. J. Stonley won somewhat easily with nine Teas, his Cleopatra, Innocente Pirola, Devoniensis, and Madame Cusin being capital examples. Captain Lambert was second, he also having an admirable Cleopatra, and Mr. G. Collard was third. Mr. Stonley, who is evidently a good grower, had the best four trebles, a very good trio of Le Havre being his best flowers. Mr. S. H. Dean was second, and Captain Lambert third. Sixes in single trusses were not so good. Mr. E. V. Dean was first, Mr. W. W. Mason second, and Mrs. Scudamore third. In another class for six the prizes went to the Rev. Canon Holland, Mr. W. Rigden, and Mr. F. Honeyball in the order given. Canon Holland had the best three varieties, Dupuy Jamain, Eugène Fürst, and Marie Van Houtte representing him. Mr. S. A. Smith was second, and Mr. W. Rigden third. The Canon again won with three Teas, his varieties being Souvenir d'un Ami, Madame Cusin, and Jean Ducher. Mr. W. Rigden was second, and Mr. A. Nash third.

Colonel Pitt received the first prize for six blooms of any H.P., staging a good but not perfect half dozen of Duke of Edinburgh. Capt. Lambert was second with Madame Gabriel Luizet; and Mr. H. Foster third with the same variety. In the corresponding class for Teas Mr. S. H. Dean was first with Innocente Pirola, although he almost transgressed the conditions by staging an expanding bud with one of his trio. Mr. Wachter was second with Maréchal Niel, and Colonel Pitt third with The Bride. There were several other stands in competition.

In the class for thirty-six varieties, any kinds, open, Mr. G. Mount had matters all his own way, and he certainly had a good stand, his Dupuy Jamain, Baroness Rothschild, Marie Baumann, and Etienne Levet being very good indeed. It was the same in the class for twelve trebles. Marie Baumann was splendid, Louis Van Houtte and A. K. Williams were also good. A trio of Niphetos looked too clean and pure to have been cut from out of doors.

Considerable difficulty was experienced in awarding the prize for the best Tea, and eventually Mr. Biron's Innocente Pirola in his first prize stand of twelve, and Mr. Stonley's Cleopatra in his first prize stand of nine Teas, were placed equal first. Both were beautiful blooms, and it was difficult to choose between them, but another day or two would have improved Cleopatra, and probably given it the victory. Mr. H. Foster had the best H.P., a perfect specimen of Dupuy Jamain, but it was run very close by a beautiful bloom of A. K. Williams in the Rev. J. R. Buchanan's stand.

WINCHESTER.—JUNE 30TH.

THE annual Rose Show of the Horticultural Society of this ancient city was held as usual in the Guildhall, and was in every way a success. Perhaps the entries were not so numerous as in some previous seasons owing to the unfavourable weather experienced during March, but what was lacking in quantity was fully made up in quality, which was of a uniform character throughout. The arrangements were, as usual, all that could be desired, and reflected much credit on the Hon. Secretary, Mr. Chaloner Shenton, and the Chairman of Committee, Mr. Flight.

The principal class was that for forty-eight distinct varieties, in which Mr. B. R. Cant was the only exhibitor. He staged medium-sized, full, and fresh examples of such uniform excellence that we give the whole list of varieties. Lady Mary Fitzwilliam, Dupuy Jamain, Souvenir d'Elise, Mons. Trevo, Marie Finger, Marie Baumann, Marchioness of Dufferin, Mdme. Isaac Pereire, Innocente Pirola, Duke of Edinburgh, Mdme. Gabriel Luizet, Alfred Dumesnil, Merveille de Lyon, Gustave Piganeau, Mrs. Paul, Ulrich Brunner, Heinrich Schultheis, Princess of Wales, Ella Gordon, Pride of Waltham, Dr. Sewell, Vicomtesse Folkestone, Mdme. Prosper Laugier, Violet Bouyer, Alfred Colomb, Mdme. Scipion Cochet, Mdme. C. Joigneaux, Maréchal Niel, Charles Lefebvre, Duchess of Albany, Ferdinand de Lesseps, Margaret Dickson, Baroness Rothschild, John Hopper, Comtesse de Nadaillac, Thomas Mills, Caroline Kuster, A. K. Williams, Mdme. Cusin, Sénateur Vaisse, Cleopatra, Marie Verdier, Mdme. Willermoz, Général Jacqueminot, Catherine Mermet, Suzanne Marie Rodocanachi, The Bride, and Comtesse d'Oxford. Mr. B. Cant was also awarded first prize in the class for twenty-four distinct trebles. Mdme. Gabriel Luizet, Gustave Piganeau, Jeannie Dickson, Mrs. Paul, The Bride, Dr. Sewell, Etienne Levet, Mrs. J. Laing, and Mdme. Marie Finger formed a beautiful and even stand. For twelve trebles, distinct, there was a brisk competition. Dr. Budd, Brooklyn Road, Larkhall, Bath, was first with a charming collection, not large blooms, but of excellent quality; Messrs. Keynes, Williams & Co., The Nurseries, Salisbury, second. For twenty-four distinct Dr. Budd repeated his previous success with high-class blooms. Camille Bernardin, Mdme. Gabriel Luizet, A. K. Williams, Gustave Piganeau, Duchesse de Morny, and Mdme. Gabriel Luizet were the most conspicuous examples. Messrs. Keynes & Co. were again second. Mr. R. E. West, Reigate, third. For twelve blooms any one variety Hybrid Perpetual, dark, Mr. B. Cant followed up his previous success by winning first honours with Gustave Piganeau in good condition. For twelve blooms of any light variety Hybrid Perpetual Mr. Cant was successful with perfect examples of Madame Gabriel Luizet; Dr. Budd followed with La France. Messrs. Cant and Keynes secured the prizes in the order named for twelve blooms of any Tea or Noisette with Innocente Pirola and Niphetos in good condition.

The following classes were not open to nurserymen. For twenty-four, distinct, single trusses, there were seven competitors, all staging creditably. Mr. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, was an easy first with medium-sized fresh examples of leading varieties; the Rev. W. Romaine, The Priory, Old Windsor, second; Dr. Budd third. Dr. Budd turned the tables in the class for twelve distinct trebles with a charming collection; Mr. Neville second; Mr. T. Hall, gardener to S. Montague, Esq., South Stoneham, third. For twelve Teas or Noisettes, distinct, single trusses, Mr. Neville was first, Dr. Budd second, Mr. Romaine third. For twelve, distinct, single trusses, Dr. Seaton, Rutland Lodge, Bitterne, won easily, and in the amateurs' class for twelve blooms, not less than six varieties, Mr. Henry Owen, Church Lane, Basingstoke, was the most successful; Mr. Walter Wadmore, Basingstoke, second.

The classes open to ladies only produced a brisk competition and most meritorious exhibits. For the best dressed stand of flowers, Miss Ladhams, Shirley, won with a charming arrangement; Miss A. Flight second with a superb stand; Miss Nelly Owen, Basingstoke, third; Miss N. Pinnick fourth. In the class confined to wild flowers only, Miss Flight secured an easy victory with an elegant arrangement amongst six other competitors, Miss Nelly Owen second, Miss Ladhams third.

Several meritorious groups of plants were arranged around the sides of the hall. In the principal class, Mr. Thos. Lowns, gardener to F. C. Birch, Esq., Clovelly, was first, and Mr. Astridge in the other class. Groups not for competition were arranged by Mr. E. Molyneux, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham (who also had a most meritorious exhibit of hardy flowers), Messrs. E. Hillier and Jeffrey, nurserymen, Winchester, which assisted considerably in the embellishment of the hall. Mr. Ladhams, florist, Shirley, staged an excellent collection of hardy cut flowers. The Exhibition was bright, fresh, and diversified, and much enjoyed by the visitors.

SUTTON.—JULY 5TH.

THE eleventh annual Exhibition of the Sutton Amateur Rose Society was held in the Public Hall, Sutton, on Tuesday, July 5th. Compared with other Rose Shows of the week that under notice was somewhat small, but the blooms were nevertheless exceptionally fine, and the Exhibition was of a diversified and bright character.

In the open class for thirty-six distinct, single trusses, there were but three entries, and the first prize was awarded to Messrs. D. Prior & Sons, Colchester. The blooms in this stand were fresh and bright, the best being Mrs. John Laing, A. K. Williams, Ulrich Brunner, Etienne Levet, Horace Vernet, and Madame Lambard. Mr. W. Taylor, Hampton, was second with small and neat blooms, and Mr. W. Rumsey, Joyning's Nursery, Waltham Cross, third. Messrs. Prior & Sons also secured the first prize for twelve Teas or Noisettes, showing a stand of beautiful blooms, amongst which Marie Van Houtte, Francisca Kruger, and The Bride were most conspicuous. Mr. W. Rumsey was second, and Mr. Taylor third in this class.

The principal amateurs' class was for twenty-four distinct, single trusses, and in this there were four competitors. The competition was somewhat keen, the first prize, however, being awarded to Mr. A. Slaughter, who staged a stand of fresh even blooms. Amongst these Madame Gabriel Luizet, A. K. Williams, Captain Christy, Charles Lefebvre, Victor Hugo, and Prince Arthur were the most conspicuous. Mr. R. E. West was a good second, and Mr. E. M. Bethune third. In both cases the blooms were even and fresh. For eight distinct trebles, Mr. J. G. Fowler was first, and Mr. E. M. Bethune second, the third prize going to Mr. R. E. West.

The best dozen single trusses of Teas or Noisettes were staged by Mr. E. M. Bethune, the blooms being fresh and perfect in form. Catherine Mermet, Madame Cusin, and Ethel Brownlow were very fine in this stand. Mr. A. Slaughter was second with a stand of neat blooms. Mr. Ernest Wilkins showed the best twelve single trusses, any variety, and also secured leading honours for six distinct trebles and nine Teas or Noisettes. For six distinct, single trusses, Mr. M. Hodgson, Shirley Cottage (gardener, Mr. H. Shoesmith), was placed first, showing neat blooms of *Séateur Vaisse*, Dupuy Jamain, Maurice Bernardin, Ulrich Brunner, Charles Lefebvre, and Duke of Edinburgh. The second prize was won by Mr. J. De la Mare, and the third by Mr. C. J. Grahame. The best nine distinct singles were shown by Mr. F. O. Devereux, amongst these being a splendid bloom of Ulrich Brunner. Mr. M. Hodgson was a close second with a stand of delightfully fresh blooms, and Mr. J. De la Mare secured the third prize. For four distinct trebles Mr. F. O. Devereux was first with neat blooms of Hon. Edith Gifford, The Bride, Mrs. J. Laing, and Germaine Caillot. Mr. J. De la Mare was awarded the second prize, there being no other competitors in this class. Mr. F. O. Devereux was also first for six Teas, Mr. C. J. Grahame and Mr. J. De la Mare being second and third.

Mr. Ernest Wilkins had the best twelve distinct, single trusses, in the class provided for local exhibitors, the blooms in this stand being very fresh. Mr. W. Hooper was adjudged the second award, the third falling to Mr. W. F. Hughes. Mr. E. M. Bethune showed the best twelve blooms of any Rose, the variety being The Bride, and Mr. F. G. Fowler was second with Mrs. J. Laing. Mr. W. F. Hughes was first in the class open to growers of less than 500 plants, with nine distinct, single trusses, showing grand blooms. Mr. H. G. Malholm was second, and Mr. W. R. Miller third. The last-named exhibitor was placed first, however, for six distinct single trusses, the best blooms in this stand being *Souvenir d'Elise* and *Camille Bernardin*. The second prize went to Mr. W. F. Hughes, and the third to Mr. A. S. Heiron. There were eight competitors in this class. For six single trusses of any

Rose Mr. A. S. Heiron was placed first, showing beautiful samples of *Her Majesty*. Mr. F. G. Detmar secured the second prize with six well-grown blooms of *Charles Lefebvre*, and the third went to Mr. W. F. Hughes. Miss Atkins was awarded first honours for three Hybrid Perpetuals, and Mr. W. F. Hughes was allotted second position, the third prize falling to Mr. H. Chadburn. The latter, though, obtained the first prize for three Teas, Mr. T. C. Crump and Miss Atkins being second and third respectively.

The dinner table and other decorations were effective, although the entries were not numerous. Miss Mabel Morton secured the first prize for a table decorated with Roses, the other prizewinners being Mrs. A. Bawtree, Mrs. Ernest Wilkins, and Mrs. Malholm. Baskets and bouquets of Roses were also admirably shown by Miss Bacon, Mrs. A. S. Heiron, Miss Mary Fisher, Miss Grace Chadburn, Miss Sybil Hughes, Mrs. F. G. Detmar, and other ladies.

Mr. R. W. Miller secured the medal for the best bloom in the Show with a splendid example of *Comtesse de Nadaillac*.

CROYDON.—JULY 6TH.

ALTHOUGH Croydon Show is not by any means confined to Roses they are always largely represented, and on the present occasion occupied about 300 feet of tabling. The blooms, too, were very good in quality, taken collectively, as might have been expected from the names of the exhibitors. It is true several prominent amateurs, such as Mr. E. B. Lindsell, the Rev. J. H. Pemberton, and Mr. Budd were not competing, but Mr. Brown, Mr. C. J. Salter, Mr. Mawley, Mr. C. J. Grahame, and other good growers were, while the professional contingent was very strong, including Mr. Frank Cant, Mr. B. R. Cant, Messrs. Prior & Son, and other leading exhibitors. The presence of the two great Colchester growers was a guarantee of itself of some beautiful blooms being staged, and those who visited the Show must have been gratified to observe the splendid quality of their flowers. Every day since the beginning of the month seems to have improved them, and at Croydon there was not only symmetry, colour, and finish, but greater weight than was observable at the earlier shows.

Some very beautiful blooms were shown by Mr. Frank Cant in the class for forty-eight, and he won easily. They were not only large, but very fresh, rich in colour, and well finished, comprising one of the best forty-eights the young Colchester exhibitor has staged. Mr. B. R. Cant was second with fresh bright blooms, and Messrs. D. Prior & Son third. Mr. B. R. Cant was victorious with twenty-four trebles after a good contest. Save for one or two varieties being past their best this was in every way an admirable stand. Mr. Frank Cant followed a few points in the rear, and Messrs. Prior & Son were a close third. The first prize stand of twenty-four was exhibited by Mr. W. Taylor of Hampton, the flowers being undersized, but otherwise good; Messrs. G. Rumsey, Wrotham, and T. Butcher being second and third. Messrs. Prior & Son scored their first win with eighteen Teas and Noisettes—a very fine stand, Messrs. Frank Cant and B. R. Cant following. Messrs. Prior had the best dozen of one variety, winning with an excellent stand of Horace Vernet. Mr. B. R. Cant was first with *Gustave Piganeau*, and Mr. Frank Cant third with *Marie Baumann*. Messrs. Prior also won with twelve of any Tea, having a delightful box of *Marie Van Houtte*. Mr. B. R. Cant was third with *Mad. de Watteville*.

Mr. J. Brown, gardener to Mrs. Waterlow, had the best stand of thirty-six in the amateurs' section, and his flowers were in very good condition. Mr. C. J. Salter, gardener to T. B. Haywood, Esq., was second with somewhat smaller flowers, but fresh and well coloured, and A. Tate, Esq., third. These stands were all very close in point of merit. E. M. Bethune, Esq., won with twenty-four. There was not much to choose between his and Mr. P. G. C. Burnand's stand, but a little superiority in weight gained Mr. Bethune the award. Both had well coloured and excellently finished flowers. Mr. W. Blundell was third. The best eight trebles by far were those of Mr. Brown, who had heavy, well-balanced flowers. Mr. W. Blundell was second, and Mr. Salter third. Dr. Tucker won with twelve of one variety, showing *Her Majesty*, Mr. Brown second with the same variety, and Mr. Salter third with *Madame G. Luizet*. Mr. Bethune won with eighteen Teas, the flowers somewhat small, but fresh. A. Slaughter, Esq., was second. J. Parker, Esq., won with six of one variety, Messrs. Bethune and C. J. Grahame following. Mr. J. Brown won with twelve, a capital stand. In other classes the prizes went to Messrs. Wilkins, Mawley, Grahame, Parker, Bateman, Shoesmith, J. de la Mare, Dart, Wright, Stew, and Hasler. Messrs. Mawley, Grahame, and Shoesmith in particular had some beautiful blooms, and several first prizes fell to their share.

The floral decorations were numerous, and the influence of Mr. Wilks' floral work appears to have a strong hold on the local ladies, for Shirley Poppies were lavishly employed. The classes for general plants brought out some excellent exhibits. Greenhouse flowering plants were very fine, particularly Tuberous Begonias, which were admirable, the strains being good and the plants well grown. Ferns and Selaginellas were a good and extensive display, but unfortunately space cannot be found for details of the awards. The miscellaneous exhibits were equally noteworthy.

The Society was more fortunate in respect to weather than it has been on several previous occasions, for though somewhat lowering at times the weather remained bright, warm, and sunny during the greater part of the day. If the same conditions prevailed in the evening the exchequer would, no doubt, benefit, for the Show is very popular in the district, a sixpenny gate in the evening bringing in many hundreds of visitors. An efficient band of workers was headed by Mr. Roffey, who as Secretary is essentially the right man in the right place.

HARDY FRUIT GARDEN.

Raspberries.—The increase of a large number of suckers round the old stools is most detrimental to the well-being of the plants. In most cases more suckers are annually produced than can possibly be required, many growing thickly together in masses near the base of the fruiting canes, others at some distance away. The best of those situated close to the main stools or rows of plants select for preservation, choosing those that are strong. Draw out all weaker growths, as, being not only useless but shading and robbing the others of nutriment, they prove injurious to the future welfare of the permanent plants. Four to six are the most that need be retained round each stake, but where Raspberries are grown in rows the suckers required to produce the future bearing canes must be secured at the most convenient places for readily tying at the proper time to the trellis or wires. In addition to removing superfluous suckers root out all coarse weeds which may have established themselves. The mulching of manure applied in spring is often the means of introducing the seeds of undesirable weeds. If so, and they have now become apparent, hoe them down at once, preferably on a hot sunny morning, when they will soon wither. The ground being clear of weeds, and probably little left of former mulchings of manure except strawy material, it is advisable to apply another coating of rich manure, as the active enlargement of the fruit, the expansion of the foliage, and thickening of the young stems, results in great demands on the soil resources both in nutriment and moisture. In light soils the demands of the plants may not be thoroughly met without recourse to watering, but if water be applied it must be given liberally, and previous to a heavy mulching, to retain moisture by preventing evaporation.

Gathering Strawberries.—Under the influence of favourable weather Strawberries ripen quickly, and when due provision has been made to preserve the fruit from the attacks of slugs, grubs, and birds the work of daily picking the ripest fruit is a pleasant task. It is much better to do this, securing all the forwardest fruits, than to leave the whole until a plethora of ripe and too ripe fruit demands instant attention. Not only do Strawberries ripen quickly, but they spoil quickly after the ripening point is reached. In moist weather the tendency to decay often shows itself before the fruits are fully coloured, because, the pulp being so soft and absorbent of moisture, the outer tissues of the fruits are soon injured. This is more apparent on thickly growing beds of Strawberries than on those more rationally managed. Old plants, too, not being so vigorous and lacking adequate nutrition, are very liable to suffer from untoward influences if not carefully managed at fruiting time. The best time of the day for gathering ripe Strawberries is undoubtedly early morning when the dew has evaporated. To have the best examples in the finest condition each fruit should be carefully detached with a portion of stalk. For immediate use or where appearances are not considered a more rough and ready style of gathering can be adopted. Strawberries required for preserving must be gathered in a dry condition. It is not desirable to have large quantities of fruit in bulk for a longer time than necessary, as fermentation soon sets in, decomposition following to the utter ruin of the fruit. By spreading the fruits out thinly, keeping them dry and cool, they remain fresh and perfect much longer. Those gathered wet or over-ripe suffer sooner than examples collected in the best possible condition.

Propagating Strawberries.—Frequent attention to the selection and expeditious rooting of the best plantlets on strong runners is necessary just now. For the earliest crops and for forcing purposes plants secured early by rooting runners in small pots are the best, as no check is received when transferred to the permanent beds or fruiting pots. Three-inch pots filled with rich soil are plunged in the ground near strong runners having plantlets with rootlets just visible; these are fastened to the surface with a wooden or wire peg, or even a stone. The latter is not objectionable because it affords a little shade to the soil in hot weather. When required only for planting in the open ground squares or cubes of turf of a handy size thoroughly well soaked before using with water or liquid manure, prove very useful for rooting plants with little trouble save that of keeping the turf moist. Thick, bulky squares of cocoa-nut matting have been used in a similar manner with good results. A little small flaky manure scattered in among the fibres of the matting would induce the roots to spread. Stop all the runners beyond the rooting medium, one plantlet only to each wire being retained when intended for pot culture or very early planting. Only those rooted in pots should be used for pot cultivation. Hundreds of good, well-rooted plants can be secured without resorting to these forwarding aids by simply leaving the runners alone to root of their own accord, thinning out the weakest early. These cannot be depended upon to fruit freely the first year. Moderately stiff retentive soils usually produce good plants in this manner. They can be dug up with abundant roots and soil adhering for planting at once. A careful weeding out of the weakest runners and those not wanted contributes to the success of those retained whatever method of propagation is followed.

Currants and Gooseberries.—If not already done, shorten back to two or three pairs of leaves the current growths on the main branches of Red and White Currants. This will admit light and air to the ripening fruit, and swell up the buds at the base for fruit-producing another year. Gooseberries can be treated in the same way, and should be attended to at once if this system is followed, though judicious thinning out, retaining a fair quantity of young wood without shortening is a profitable method of management, and produces good crops. Retain a sufficient number of strong growths or suckers in Black Currants, leaving them at full length for future bearing. Weak or useless wood, or any older branches not fruiting, or which have fruited, cut out now to make room for younger growth.

FRUIT FORCING.

Pines.—*Starting Suckers.*—The early section of summer fruiting plants have fruited rather later than usual, but they have suckers which will soon be fit to be taken, and to receive these the necessary provision must be made at once, so that they may have the benefit of the sun's warmth in developing growth for as long a time as possible. A fermenting bed in a low damp house or pit should be provided, and its heat steady at 90° at 6 inches from the surface, but 95° may be allowed at the start, and that must not be exceeded. Take the suckers from the parent plants carefully, trim the base smooth, and place directly into 5 to 7-inch pots, according to the size of the suckers, and water once in order to settle the soil about them. Good fibrous loam torn up by hand without any admixture is the most suitable compost; embed it firmly in the pot, so that a sturdy growth will be induced in the plants. Keep the suckers rather close and shaded for a week or ten days, sprinkling through a fine-rose syringe once or twice a day according to external influences. When growth takes place more ventilation with less shade is desirable, but this must be proceeded with gradually until the growth is well decided and inured to the sun, then accord them ordinary treatment.

Placing in Fruiting Pots.—When the suckers are well rooted they should be transferred to the largest pots before the roots become matted together. Queens and Black Jamaica should be given 10-inch pots, other sorts 11 or 12-inch, using fibrous loam, but more lumpy than for suckers, adding a sprinkling of steamed bone meal; and to prevent worms entering the pots a handful of soot or wood ashes from small twigs may be sprinkled over the drainage. Pot firmly, and accelerate growth as far as is consistent with a sturdy habit.

Cucumbers.—A few seeds may now be sown for late summer and early autumn produce. The plants from this sowing will afford much finer fruit in late summer than plants that have been bearing for a considerable time, as old plants generally produce knobbed (seeded) fruits towards the end of the season, and are neither so handsome nor useful as straight seedless fruits. The plants will be fit to plant out in a month, and succeed admirably in frames with a gentle bottom heat, such as may be afforded by the least reduced materials from spent hotbeds, mixed with a little rather fresh, but not raw, stable litter. It is desirable to have the bed 18 inches to 2 feet high, so that linings can be given in late summer and early autumn so as to have fruit up to a late period.

Plants in Full Bearing.—These must have attention in thinning exhausted growths, removing bad leaves, stopping, tying, and regulating, so as to keep up a succession of bearing wood. Add a little fresh soil to the surface of the bed from time to time, and a light mulching of sweetened horse or cow manure, the latter dried and broken up. If the plants grow weakly, sprinkle a little superphosphate on the surface and wash in. Syringe at closing time, and maintain a good moisture all day by damping the floors and other surfaces in the morning, noon, and early in the evening. Avoid too much moisture in dull weather, as it makes the growths soft and the foliage more susceptible of injury on a bright period ensuing. After a few days of dull, moist weather it is desirable to shade, and keep the house rather close on the return of bright days. Supply liquid manure copiously once or twice a week, but it will not benefit plants poorly furnished with roots and sparse foliage. What such need is fresh soil or surface dressings of lumpy material. Close early, say at 85°, and so as to gain 5° to 10°, and only employ fire-heat to prevent the temperature falling below 60° at night. The plants, especially young, must not be overcropped, and the fruit should be cut as soon as ready for use, as if allowed to remain they exhaust the plants, and prevent, in a great measure, a good and continuous supply; but that is greatly influenced by maintaining a succession of young growths.

Melons.—*Late Plants.*—It is important that the late plants be placed out at once, especially where the means of affording artificial heat is confined to fermenting materials. Whether grown in pits or frames a sufficiency of fermenting materials should be used to raise a bottom heat of about 90° to start the plants quickly.

In Houses.—When the crops are cleared, the plants if exhausted, should be removed, and preparations made for a fresh start at the earliest opportunity, but if the plants are in good health it is sheer folly to root them out, as they will come into bearing again much sooner than young plants, and are in every way more tractable; indeed, if the plants are not overcropped, do not suffer from insufficient water at the roots, and the foliage is kept healthful, they will continue bearing as late as is desired. When the crop is cut the plants should be divested of most of the old or damaged leaves, fresh growths being encouraged in the place of any exhausted, which should be cut away. Loosen the surface of the bed, remove some of the soil, apply a couple of inches

of fresh loam, and give a good watering. When growth is taking place afford an application of liquid manure, and then treat as for former crops. When Melons are grown upon the continuous system it is well to note that the laterals will grow somewhat freely and show fruit abundantly after a few joints of growth. The flowers after being impregnated will set and the fruit swell freely, so that sufficient moisture only need be accorded to maintain the plants in continuous bearing. Attend to stopping, thinning, tying, or otherwise regulating the growth, not allowing pressure of work in other departments to interfere with this, or the results will be so detrimental as to be difficult to remedy.

THE FLOWER GARDEN.

Carnations and Picotees.—A considerable number of old plants were killed during the past winter, but only a comparatively few young ones were lost, seedlings proving the most hardy. All in good health have pushed up abundance of strong flower stems, and these ought not to be allowed to fall about the beds. Neat Hazel stakes are the least conspicuous, and not more than two or three stems should be tied to one of these. Well kept and moderately long Apple prunings answer well, while if deal stakes are used they ought first to be painted green. The least that can be done with strong plants is to support the flower stems with either Hazel or Birch spray, such as Kidney Beans in pots are usually staked. If extra fine blooms are desired thin out the buds freely, leaving only the prominent central ones; but for ordinary purposes no thinning is necessary, buds cut with the flowers improving the appearance of the latter rather than otherwise. If not already done lightly stir the surface of the soil and mulch with leaf soil or some other material that will serve to enclose moisture, and yet not present an unsightly appearance. It pays well to erect a light framework for supporting blinds over the beds, these protecting the flowers from heavy rains and fierce sunshine.

Forming Fresh Beds.—Supposing a good number of seedlings have been raised, and these duly potted singly or pricked out in boxes, all ought soon to be quite strong enough for planting out. If they have lately been kept in cold frames little or no hardening will be necessary, and if put out early grand flowering plants will be had for next season. They succeed very well in mixed borders, but are much the most effective and serviceable when grown in slightly raised beds, gently sloping to the south or south-west. These beds may well be about 6 feet wide, having 1 foot alleys between them, each bed holding five rows of plants disposed 12 inches apart in the row. That will be none too much space. A very rich root run is not desirable, but some fresh loam, horse droppings, and grit, such as may be collected on highways, may well be mixed with the ordinary garden soil. See that the plants are in a moist state at the roots prior to turning them out of pots and preserve the balls intact, surrounding these with some of the finest soil and making it firm. Give a gentle watering occasionally, and any put out from boxes with only a little soil about the roots should be lightly shaded from fierce sunshine, this being done with the aid of a few tree branches.

Propagating Carnations and Pinks.—The last-named will soon be past their best, on the whole they have flowered remarkably well. Much the finest flowers are produced by young plants, and the beds continue to improve as far as floriferousness is concerned for about four years. A new bed or beds ought to be formed every season, and in course of time this admits of the worn out older ones being destroyed. This season it ought to be possible for seed to be sown in quantity, at any rate in the sunny south, and it may either be sown directly it is ripe or kept till next spring. In the former case the seedlings should be kept in frames till the following spring, and the strongest of them may flower the same season. Seedlings are more vigorous than plants raised from cuttings, but the latter are most generally grown. Now is the best time for taking the cuttings or pipings, and these root the most quickly and surely over a very gentle hotbed formed on the north side of a garden wall. They will also strike readily in some districts under hand-lights in a similar position, and without the aid of fire heat. Failing these coverings they may be struck in the open. If frames are used three parts fill them with partly exhausted heating material, nothing being better than stable manure and leaves that have previously done duty. Surface them with about 4 inches of fine loamy compost in which road grit or, failing this, sharp sand has been freely mixed. The same sort of mixture should be placed either in handlights or boxes. The cuttings should be slipped off, the old plants slightly trimmed, cleared of dead leaves, and at once dibbled out 3 inches apart each way. See that they touch the bottom of the holes made with the dibber, and are well fixed. Give a gentle watering, keep the frames or handlights close, and shade from fierce sunshine. Thus treated, and kept from becoming dry, rooting will soon take place, and the plants will be ready for the open borders in September at the latest, or the stock can be wintered where struck. Carnations and Picotees may be raised in a similar manner, the small side shoots being chosen for the purpose of being made into cuttings, and the stronger growths layered in August.

Dahlias.—To have these at their best they must be liberally treated at the roots, and well attended to in the way of staking and training. The best results attend the practice of putting out spring-struck plants in preference to old roots, giving them a spit of manure and some fresh loam to start in, and confining the plants to a single stem. A strong stake should be placed to each, and the plants kept secured to these with stout raffia or small tar twine. For all ordinary purposes this will be all that is needed, the plants being allowed to branch strongly and

to flower at will, but if show blooms are required a different system must be adopted. Reduce the side growths to about four in number, selecting those rather low down, and place a stake to each. These reserved shoots must be kept carefully fastened to the stakes and not be allowed to branch very freely, a considerable number of buds in some cases being also removed. The plants will require to be liberally fed at the roots, especially if the season is at all dry and hot. Earwigs are the great bugbear of Dahlia growers, and are on the plants already. They eat first the leaves and then the petals of the flowers, and must be got rid of by trapping. The time-honoured plan of placing short lengths of hollow Bean stalks near the top of the stems is one of the best that can be tried, the earwigs collecting in these, and should then be blown out and destroyed. They may also be caught wholesale in small flower pots filled with dry moss, and inverted over the stakes.

THE BEE-KEEPER.

PUNIC BEES—MORE LIGHT WANTED.

On the 30th of June the editors of another journal say they failed to find any Punic bees in Tunis, and in the same article speak of being on the "very spot" in Tunis from whence fifty stocks were purchased from the Arabs, and the queens sent to Mr. Hewitt, exactly as stated by "A. H. B. K." on August 20th last. Can you explain, Mr. Editor, what they mean?

On June 16th they questioned the truth of there being a stock of pure Punic bees in the country. Now it is an "imported one," and they say "they have yet to see such a stock in this country or to hear of any of their correspondents having one." Do they not give themselves away? It clearly shows one of two alternatives—viz., either that your correspondents have more enterprise in them than others, or else there is an endeavour to keep the public in ignorance that such bees are to be had.

I have seen somewhere about forty hives of bees in one apiary, every one of which was headed by a pure Punic queen, and in which pure Punic bees were working, and so well do I like them that I intend very shortly to have the whole of my apiary either pure Punic or Punic crossed. See my letter in *Journal of Horticulture*, January 7th, page 11. A friend of mine who has every facility for inspecting my bees says that he is so well satisfied of the superiority of the Punic over the common bees that as soon as he can effect the change he shall not keep a common bee in his garden. These same editors gave us to understand on August 27th last that we could get these queens imported for 10 francs each, equal to 8s. Now they tell us "the supply is stopped, and none will be sent in future." Nor does it appear that they have brought a queen home with them, except, perhaps, a dead one. So far my Punic are far in advance of the others this season, and I am glad to say I can obtain all the Punic queens I want alive and well. Please explain the above confliction.—WM. CARLTON.

[We make no attempt to explain the meaning of statements that do not explain themselves.]

RACES OF BEES.

"A LANARKSHIRE BEE-KEEPER" asks me on page 500 what I think to crossed Syrians being the only stock working in supers. If he will refer to some of my articles of 1883, 1884, and 1885 he will find that I placed Syrians crossed with blacks as the most profitable bee. I also placed pure Syrians as the most pleasurable. I had not tried Punic at that time, but next to Punic I still fancy Syrians. I account for the fact of their going first into supers to their prolificness, as queens of this race lay fully 3000 eggs daily. Wait till the season ends, and see if Punic do not beat them. I am sorry, however, that these bees will not swarm with me. They are working in supers most industriously, and keep destroying the queen cells.—A HALLAMSHIRE BEE-KEEPER.

ERRORS IN NOMENCLATURE.

I AM sorry if I did not read the MS. of "R. M." correctly. We should be accurate in the description of all things, and let the nomenclature be also correct. There are many things in bee husbandry improperly termed. The word "bar-frame" leads some to suppose it is a particular kind of frame. Thirty-five years ago I had in my circulars "bar hives" and "bar and frame hives." I made these hives before comb-foundation was invented. These bars were split nearly through (such as Mr. Meadows recently patented) for the reception of strips of wax and partly built combs as guides. Some present day bee-keepers act as if no others had been born before them, so many old things and ideas being claimed as their own, and new.—A LANARKSHIRE BEE-KEEPER.

PUNICS AND A FAILURE TO IMPORT THEM.

In the *B. B. J.* for August 27th, 1891, it is stated:—"Queens could be purchased for a few francs," and further on, alluding to their having been advertised, he says, "We wonder how many bee-keepers will be induced to give £5 5s. for one." Again on September 17th a writer says, "We can send him name and address of parties in Algeria to whom he could apply for the bees." True, he only says "apply," but readers certainly understood they could obtain them. Mr. Cowan has now returned from Tunis, and I understand has failed to bring back even one queen alive. For over six years I have been the only person who has imported Punic queens alive into this country. The enemies of these bees are increasing the demand for them, and inducing more persons than they think to give them a trial.

CHANGING HIVES TO PUNICS—VIRGIN QUEENS.

A number of persons have asked me the best way to proceed in changing their bees to Punics. Pure stocks of Punics may be had at a cost of 5s. each, which is the price as advertised of two virgins. The best months in the year to get virgins are June and July. If a nucleus is made up by the side of a stock that it is intended to re-queen, when the virgin begins laying remove the old queen and unite the nucleus, then things will go on satisfactorily. The advertiser of Punic queens issues a circular to applicants giving all necessary particulars. When queens are received by letter post great care should be exercised in sliding the lid, as the queen may be injured by careless hands.

Straw skeps are best driven on the fifteenth day after the first swarm. It is not safe to do so before, as some queens may not have hatched. "After-swarms" have been known to come off after the sixteenth day, even as late as the twenty-first. What we have to do is to catch and remove the reigning virgin queen; then in two days, there being no unsealed brood or eggs left, the virgin or fertile Punic can be dropped in after forty-eight hours. Doolittle recommends that virgin queens be given five days after the reigning queen has been removed—*i.e.*, after queen cells are sealed. The experiments that I have tried on these lines, giving a virgin five days after the old stock hive swarmed, have never resulted in a perfect success. The bees have invariably protected the cells, and the Punic has led off a second swarm; still, the plan may be followed, as the virgin Punic will not be lost, but come off with a swarm as stated, or else destroy the cells, as Doolittle says they will. But here a word of caution is necessary: Never put back such a second swarm, or there is no knowing which queen will get killed, for there is sure to be some hatched before it can be put back. Better by far to hive the second swarm near the old stock, and in three or four days after drive the old stock and remove the other queen, afterwards uniting the second swarm. The process is easy in dealing with frame hives, as the reigning queen has only to be removed. If a virgin, then in two days another can be safely given them; if a laying queen, then cut the queen cells out on the ninth day, when another can be given two days afterwards.

FERTILE QUEENS.

The next course is by means of fertile queens. These can be given at any time, but the best time is during September and October, after queens have mostly ceased laying. It is always best to examine on the ninth day for queen cells. I prefer the autumn to introduce fertile queens, as there is then no risk of a strange queen getting into the hive while standing queenless.

It is expected to have at least 500 tested, pure mated, queens ready in September, and all not wanted for regular orders will be sent for 10s. down and the other 10s. next year, after they have been tried. If not liked, not only will the other 10s. not be payable, but the first will be returned also. It is this offer to return all money in full that is not liked by everybody, but I challenge anyone to publish a case in which the advertised guarantees have not been met.—
A HALLAMSHIRE BEE-KEEPER.

* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Zonal Pelargoniums at York (*E. Prothero*).—Some of the largest plants we have seen at the York Shows were quite 6 feet in diameter, nearly flat, and like bouquets for flowers. We once tried to

count the trusses on one specimen but failed. There were, however, more than 200. The plants were evidently many years old, and the varieties of necessity not modern. As you have plants 3 feet in diameter grown in eighteen months, each bearing from fifty to sixty trusses, you have done very well.

Cattleya gigas (*T. W. S.*).—The flower is a misshapen form of *C. gigas*. It is a curiosity and has no other recommendation at present. Probably it is a newly imported plant flowering for the first time; if so it should be marked and watched, as very likely it will grow out of the peculiarity. *C. Trianae* and *C. Warneri* often have badly formed and curiously coloured flowers when they first bloom, but with good treatment they soon come all right. Should the plant in question prove persistent in its present character it should be exhibited, but it would be more valuable without the curious sepals, as it would then be a very fair *C. gigas*.

Peach Leaves Yellow (*C. S.*).—The leaves are simply devoid of chlorophyll, and the wood is as pale as the leaves. Neither lacks size, but the leaves are devoid of substance, the wood is long-jointed, and the buds scarcely visible. We apprehend the soil is light and loose. If so, firm it, and supply a pound per square yard of the following mixture:—Superphosphate of lime three parts, nitrate of potash, powdered, one part, sulphate of lime one part, mix, and spread evenly, point in lightly, not more than an inch, and water copiously. If you send particulars of soil we may be able to assist you further, but admit air freely in the meanwhile. Probably the trees need lifting and the roots placing in fresh soil nearer the surface of the border.

Strawberries in the Tropics (*Emigrant*).—Your information is probably in the main correct. The following, pertaining to this subject, appeared in the *Kew Bulletin* for April:—"Strawberries are often tried in the tropics, but with varying success. In the cool climate of the hills they do very well for a time, but even there the choice sorts appear to deteriorate, and to require to be renewed at frequent intervals. Plants packed in Wardian or dry cases travel rather badly, sometimes as many as one-third to one-half being lost in one sending. To obviate this efforts have occasionally been made to send out seed selected from good sorts. In acknowledging the receipt of some seed forwarded from Kew, Mr. M. A. Lawson, F.L.S., Director of the Botanical Department, Madras, writes from Ootacamund, 15th February, 1892:—"I shall be very glad to try the Strawberry seeds, but my attempts in that line have not been a success hitherto; as the plants raised from seed have always harked back to the old alpine variety. We have, nevertheless, very good Strawberries both in Ootacamund and Bangalore, but they are grown only on a small scale. I am trying to domesticate our wild Strawberry of these hills, but as yet I have done no wonders with it." Mr. A. Henderson, Runnymede, Florida, under date of February 12th, 1892, writes:—"Strawberries have just commenced, and they will keep on until May. We have here a particular kind, consisting of three varieties, that does exceedingly well in warm countries. The runners are cut off until May (when the crop ends). This is a perpetual fruiting kind. The northern and English varieties will not thrive here." In the Blue Mountains, Jamaica, a wild Strawberry, supposed to be an escape from gardens, is found very abundantly at elevations of 4000 to 5000 feet. The fruit is regularly gathered and sold in the Kingston Market."

Grapes Unsatisfactory (*Anxious*).—The berries are of good size, and the few that are fairly coloured are good, but most are not coloured, and several are shanked. It is a clear case of overcropping. There is no remedy now, but it will help the Vines to recuperate if the laterals are allowed to extend as far as the space admits without overcrowding it with foliage. They must not, however, be permitted to interfere with the principal leaves, which must be kept clean and healthy as long as possible. Admit air freely by day, and provide enough at night to insure a free circulation. The shanked berries should be cut out, and the crop cut as soon as circumstances admit. There must not be any deficiency of water at the roots, continuing supplies as needed so as to keep the foliage fresh, and get as much stored-up matter in the Vines as possible. The evil can only be avoided by regulating the crop to the vigour of the Vines. Those planted two years previous to last February, and in their third year, ought not to have been allowed to bear fruit to the top of the house. Vines, in the early years of cropping, should not be overburdened with fruit, 1 lb. per foot of rod is sufficient at any time, and half that is better than a full crop for the first two or three years of bearing. The Vines in your case have been left too long at each season's shortening of the canes, otherwise they would not have the largest bunches at the top of the house, but have no more than 6 to 8 feet of rod on which fruit ought to be borne, which means that weight of fruit instead of 20 lbs. That is where the mistake has been made, and it must be carefully avoided in future.

Young Vines Flagging and Leaves Scorching (*G. G.*).—There is no disease whatever in the leaves, but they are slightly wilted, due to keeping the house too close or until the temperature had risen considerably, and then admitting air in a large volume at once. The leaves are small and very thin in texture, thus affording evidence that they have not had nearly enough air in their early stages, and have been subjected to too forcing an atmosphere before the Vines became well established and the roots active. This, and the light shading employed up to a fortnight ago and then removed, is the cause of the mischief. The Vines ought not to have been shaded, but brought forward gently in a well ventilated atmosphere. The old Vines on the other side of the house were not affected in the same way, because they had roots in reciprocal action with their foliage. With the sun, or even strong light,

acting early on such foliage as that sent it must flag because it has no substance, and the moisture it contains is speedily evaporated, the roots not supplying sap fast enough to meet the loss. There is no remedy but time. Admit air early, before the sun has raised the temperature of the house materially, and close early in the afternoon. Use a double thickness of herring or single of pilchard netting over the roof on the side of the house where the young Vines are, and let it remain until the foliage becomes firm, or it may remain until the early part of September. We have known Vines to flag severely through wireworm at the roots. If there is any reason to apprehend that these exist in your case, place pieces of Carrot in holes about 2 inches deep, and cover lightly. With a stick about 6 inches long, and one end pointed and thrust into the bait, a handle is formed by which the bait can be readily withdrawn. Examine daily, and the wireworms, if any, will be found feasting on the Carrot.

Mildew on Vines (*Constant Reader*).—As you "at once set to and dusted all the bunches over with flowers of sulphur when the mildew was first noticed, and have done it several times since, but to no avail," you may heat the hot-water pipes to 170°, or hotter than the hand can bear, on a calm evening, taking care not to make the water boil, and, having the house closed, paint them over with a thin cream, formed of flowers of sulphur and skim milk. The pipes should be evenly coated with the sulphur, and it is better as a fungicide to go over them twice with the brush than to put on a thick coat. The mild sulphurous fumes, tempered by the moisture given off at the same time, is fatal to the mildew, and under prudent management not injurious to the Grapes, but if over-strong the fumes harden the skins of Muscat of Alexandria and other tender-skinned white Grapes, sometimes giving them a purplish tint. The heat should be kept up in the pipes about an hour, then allowed to decline to the ordinary temperature. Mr. Fenn used anti-blight last year successfully against mildew on Vines, but we regard this as a preventive rather than a curative agent.

Australian Dendrobes (*A. James*).—From the tenor of your letter we have no doubt you will succeed very well. Mr. Williams says in the "Orchid Grower's Manual," "Many of the Australasian species succeed admirably in a cool house; but some few even from that continent enjoy the treatment of the East Indian house during the season of growth, and we have found *D. bigibbum*, *D. superbiens*, *D. Goldiei*, and a few others do best in a stove where Crotons were grown and where no shading was used. When the growth is completed they should be gradually inured to a cooler temperature and supplied with a reduced quantity of water. In the case of *D. speciosum* and *D. Hillii* the plants should be removed to the open air for a few weeks towards the end of summer, which will thoroughly ripen their just-matured stems. They should, however, be returned to the cool house before any danger from the fall of the external temperature is to be apprehended, and be placed in a gentle heat at the commencement of winter to start them into flower if they are required to bloom at that season; but if not wanted until the spring they are to be kept cool and dry all the winter."

Rating Market Garden—Assessment (*A Market Gardener*).—The question which you put was tested in the case of *Purser v. the Worthing Local Board*, as reported in the *Journal* of March 24th, 1887. This case raised the question whether glass houses and greenhouses in which fruit, flowers, and vegetables are grown for market are to be rated at their full rateable value, or only at one-fourth value by virtue of sub-sec. 1 (b) of sec. 211 of the Public Health Act, 1875, which provides, *inter alia*, that "market-gardens or nursery-grounds" shall be assessed in respect of one-fourth part only of the nett annual value. The special case found that George Purser, the appellant, was a grower of fruit, vegetables, and flowers, carrying on business at Worthing, and describing himself as a "market gardener and nurseryman," and that he was the occupier of a piece of land of about one acre one rood upon which were sixteen glass houses or greenhouses of various sizes, used by the appellant for the purpose of growing Tomatoes, Cucumbers, Grapes, flowers, &c., in the course of his business. The appellant had been rated at the full rateable value in respect of this property under the description of "greenhouses." After hearing counsel on both sides Mr. Justice Day said he did not doubt for a moment that this ground was within the exemption and should be properly rated on the one-fourth scale. His Lordship considered this a market-garden. It was a place used to garden in, and gardening was a term commonly applied to agricultural production of any kind on a small scale. His Lordship could not see that the garden was less a garden because it was wholly or partly under glass, or otherwise protected from the weather, or because it had walls or a roof. It was still a garden, and in this case it was a market-garden, because it was used for producing fruit, flowers, and vegetables for market. Mr. Justice Wills was of the same opinion, and the rate was ordered to be amended accordingly. It is well, however, to consult a solicitor in cases of this kind. Another arose shortly after the one at Worthing. This was the case of the *Lewisham Board of Works v. Cobb*. It was contended on behalf of Mr. Cobb that under Section 211 of the Public Health Act he was entitled to be rated at only one-fourth of the assessment for his nursery grounds, but it was objected that the Public Health Act did not apply to the Metropolitan district except where specially provided, and that an objection which was raised to the mode of assessment would be outside His Worship's jurisdiction. Mr. Montagu Williams did not consider his Court was the place to decide the question Mr. Cobb raised, and made an order for payment of the rates, remarking that the case at Worthing did not appear to be exactly like the present one, and he believed there was no dwelling house on the property in that instance. Your land is liable to be assessed at a higher

value by reason of the greenhouses upon it, even if the assessment is higher than the rent.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*T. O.*).—The British Fern is probably *Polystichum aculeatum*, but the specimen is insufficient for satisfactory identification. (*J. L.*).—Specimen much crushed and shrivelled, probably *Ceanothus rigidus*. We are too crowded for answering your letter on another subject this week. (*A Thirty-years Subscriber*).—1, *Polypodium appendiculatum*; 2, *Microlepia hirta cristata*; 3, *Dictyogramma japonica*; 4, *Doodia media*; 5, *Aspidium coriaceum* (*Polystichum capense*); 6, *Lastrea tenericaule* (*Nephrodium setigerum*). (*D. M.*).—1, The wild form of *Viburnum Opulus* (Linn.); 2, *Euphorbia Lathyris*, the Capr Spurge.

COVENT GARDEN MARKET.—JULY 6TH.

PRICES remain as last week with the exception of Strawberries, which are coming light at higher rates.

THE FLOCK IN SUMMER.

SHEARING, dipping, weaning, and draughting are familiar terms, which indicate the ending of spring work among the sheep and a re-arrangement of the flock for the summer. There is no resting

time, no period in the whole of the year when the flock does not require our best attention, for which it certainly repays us in one way or other, even with prices so low as they are just now. Sales of tup lambs are already announced, but for ordinary purposes it is unnecessary to purchase before September, when we procure a well-bred animal for each fifty ewes.

Since ewe mutton ceased to be in demand, the fattening of old ewes when withdrawn from the flock has not been so remunerative as it once was, but so much good is done to the land by such old sheep in folds that we continue to fatten them, only taking care not to spend one penny upon cake for them. Home-grown corn soon plumps them, and with it we contrive to make the crones pay their way at any rate. Here, again, management tells. When draft ewes have been kept with the lambs so long that they are reduced to mere "bags of bones," the fattening of them becomes so costly that a guinea's worth of food may be required to produce a sovereign's worth of mutton. Very different is it with ewes whose condition has been well sustained. They fatten quickly and cheaply, and are still comparatively profitable. Not always are low prices to be taken as a fair indication of the condition of trade—far from it. Many a flock is sold at midsummer to raise money wherewith to pay the rent. Both ewes and lambs may then be in a wretched plight, and it is precisely those who so mismanage them who are loud in complaints of low prices and hard times.

All ewe lambs selected for breeding are, when weaned, kept growing briskly, sometimes with the aid of some crushed corn, more frequently without it if we have plenty of sainfoin for them. Tares, too, are good for lambs, but they should not be folded till growth is well advanced, very young succulent growth often causing scouring. Symptoms of this should always have instant attention; a prompt change of diet, and a run daily on sound pasture do much good. In these hard times we cannot afford to wait till the second season, but must have a lamb the first year; that is why stress is laid upon the importance of a little forcing for ewe lambs. Turn in the tups early in September so as to time the lambing for January; have the ewes always well fed, avoiding extremes altogether; assist lamb and ewe by judicious feeding as soon as the lamb is able to eat, the tegs will then be strong, forward animals by autumn, quite fit for breeding. There may be a degree more of uncertainty as to results from such young animals; but we may certainly calculate upon an average of a lamb per ewe. Under good management early breeding does not affect the growth of the ewes at all; we have had no better ewes than those from which a lamb has been had in the first year of the ewe's existence.

Wether lambs, hogs, or hoggets are so useful for autumn and winter folding that they are mainly kept over for that purpose, and are not forced on for an early sale. Sheep folds enrich the land, keep down manure bills, render the flock very much more to the farmer than a mere producer of so much mutton and wool, and should always be regarded as an indispensable adjunct to successful farming. Hogs are much more suitable than ewes for winter folding on arable land. Such sturdy young animals have more vitality, more strength to withstand the effects of the unavoidable exposure than pregnant ewes, coming out of the folds gradually in batches ripe for the butcher, leaving the land rich in fertility for the next crop. Old ewes drafted from the flock are, on the contrary, folded on pasture—poor upland pasture preferably. If it is very poor the folds are used for forty-eight hours, size of fold always being a hurdle for each sheep. For pasture in fair condition twenty-four hours is sufficient, twice the area of land being thus covered, as it very well can be when there is an annual dressing of manure. There is much more true economy in an annual feeding of soil than when it only has manure once in two years. Soil exhaustion is then practically impossible, and the sound principle of sustained fertility is applied in the best

way—i.e., that of home production and the avoidance of manure bills. Although we lay such stress upon the value of chemical manures, preference is always given to sheep folding whenever and wherever it is possible.

Summer is the time to get under and keep under foot-rot. Let the flock have a frequent change of quarters; separate every affected animal from the flock; examine all the feet of sheep in a tainted flock frequently; look closely for pieces of a hard substance in the hoof division; pare off any broken or overgrown parts of the hoof most tenderly; use Gell's ointment upon wounds or diseased parts, and disease will be kept down to the comfort of the flock and the profit of the flockmaster.

WORK ON THE HOME FARM.

Haymaking is now in full swing, and we have gladly dispensed with the services of some fifty labourers from estate work to assist the tenants in saving the hay. It is, indeed, a time of anxiety, and everything possible must be done to make good hay. With the barometer at "set fair" we can venture to dispense with haycocks, but they cannot be avoided in unsettled weather. A proud man was an old tenant who had a "bit o' good hay" to spare for the squire's stables at the beginning of haysel, when most of his neighbours had long ago used every scrap of dry fodder. Ah! there is nothing like good management—that working with a purpose and plan, which takes well into account the possibly long hard winter and late spring.

Do not wait for a heavy crop, but mow now and let your stock have the benefit of an abundant aftermath. To cheesemakers this is a point of especial moment. A good flow of milk at midsummer is of vital importance; of equal importance is a full aftermath of rich herbage. Then is the time when it is most profitable, because it means more and richer cheese. The late spring seriously affected both quality and quantity in the cheese making, but matters have improved so much that at our best cheese farm the number in the cheese room on the last day of June was only twelve behind the average. The only profitable store castle for dairy farmers is a reasonable number of heifers. Steers should always be got rid of as calves. If this were done, the true dairy stock—the herd—would not so frequently be on short commons in winter.

At the home farm we are making several stacks of Rye grass hay, containing only a slight mixture of Clover. With carriage horses and hunters to supply, there must be a special and ample provision of good sound hay for the purpose over and above all possible requirements of home farm stock. Hay made from "seeds" is much in favour with the rather difficult requirements of the superior stables; so, too, are winter Oats. It is sound policy to meet such wants so fully and well as to prevent complaints, and to avoid the too common friction between the departmental managers of large establishments. These stacks of hay are made within easy distance of the stables, in view of less carting in winter, as well as to save time now, by building stacks in a corner of the hay field.

REMARKS.

26th.—Bright and hot; a little cloud in afternoon.

27th.—Sunny and warm.

28th.—Overcast morning, a little sun in afternoon; thunderstorm from 8.30 P.M. to 3 A.M., violent from 9 P.M. to 10 P.M., and 1.45 A.M. to 2.15 A.M. on 29th; 0.20 inch of rain fell in five minutes at 9.30 P.M.

29th.—Thunderstorm till 3 A.M., then overcast; frequent sunshine after noon.

30th.—Generally sunny and warm, but occasional cloud in afternoon.

1st.—Brilliant morning, cloudy at times in afternoon.

2nd.—Bright and warm.

Fine summer week, with thunderstorm on Tuesday, but not much damage, as the lightning was chiefly from cloud to cloud, not from cloud to earth.—G. J. SYMONS.

It is not often that it falls to the lot of any gardener to carry out a series of dinner-table decorations solely with hardy flowers, nor is it altogether desirable that it should be so; indeed it is practically impossible to produce an effective display with such materials at many seasons of the year, and it so happens that the greater part of this kind of work has to be carried out at the very seasons when flowers are comparatively scarce, even where great resources are at command. When, therefore, a great event which necessitated the carrying out of dinner-table decorations on an extensive scale fortunately takes place in the summer months, when flowers are abundant in the open air, it is well to make use of them for such purposes, so that the choicer ones may be reserved for the embellishment of other rooms in the castle or the mansion.

I hold the opinion that dinner-table decorations are judged principally by the effect produced. If that is beautiful, striking, or pleasing, it is only a secondary consideration whether the materials used to create these effects are the simplest flowers from the garden or the roadside of our own land, or the choicest exotics brought from distant climes. Now this opinion would not be worth much to readers of the Journal if I advanced it simply as such, but fortunately I had the opportunity recently of putting this view to a pretty severe test by carrying out extensive table decorations for six consecutive nights entirely with hardy flowers. That the departure was perfectly successful is shown by the fact that I received high compliments from my noble employers, who dilated upon the great beauty of the arrangements, and who had the satisfaction of knowing they were greatly admired by the large and distinguished company present. I trust, therefore, a few notes concerning the flowers used, and their method of arrangement, may be both interesting and useful to some readers of the Journal.

Before proceeding further it is necessary for me to impress upon my readers the fact that the dining room wherein these decorations were carried out is of unusual size, and is fitted up throughout with regal splendour; the elaborate decoration of the walls and ceilings being executed in white and gold, while at each end are beautiful carved figures which rank among the finest examples of that ancient art. The dinner table, too, is of unusual width—6 feet. Amidst all these massive surroundings it may, therefore, be easily imagined that flowers of a bolder type than those generally used for the purpose must be necessary to produce a really effective display. In order to prove this to our own satisfaction, on one occasion flowers of a light character were entirely used. The effect was that with so much that was imposing around them they seemed quite out of proportion, and to use a common but expressive term were simply lost. In order to be able to produce as great a change as possible, the flowers on each occasion were, as a rule, of one colour only. This plan, however, had to be departed from on the first night, as Pansies and Violas were intended to form the chief feature. It was also desirable to use three large handsome stands for the centre of the table. These had each a beautifully worked base, upon which was mounted a circular framework. Into this tins filled with sand were fitted, the flowers and Ferns being stuck into the sand.

The central stand was placed immediately under a magnificent

chandelier, and was about 2 feet in height; the other two, being placed near the ends of the table, were 6 inches higher. White Pæonies, double white Pyrethrums, and Marguerites were arranged lightly into these. A few fronds of *Polystichum angulare proliferum* were placed so as to stand out lightly from among the surrounding flowers; other fronds of the useful hardy Lady Fern were inserted here and there to hide the base of the flower stems. The sides of the stands were lightly draped with long pieces of *Asparagus tenuissimus*, which in some instances reached down to the cloth and trailed a foot or 18 inches upon it. Field Grasses cut with long stems were next inserted at irregular heights and distances, so as to stand well up above the surface of the flowers, making the whole arrangement appear wonderfully light, and yet imposing. A fringe of Maidenhair Fern being next placed around the base, this part of the work was completed. Between these floral arrangements, which were placed along the centre of the table, two candelabras were located, and as these as well as the stands were placed a considerable distance apart, the cut flowers standing well above the heads of those sitting at the table, the view across it was but slightly impeded. All other arrangements were kept quite low.

Ten ordinary large size plates were next obtained; in the centre of each a small graceful Palm was stood, each having a mound of moss placed around it. These mounds were covered with *Lycopodium denticulatum* (which had been largely grown in pots for the purpose), care being taken to let the moss droop well over the sides of the plate, so that when placed upon the cloth no part of it could be seen. Four of these mounds of Lycopod were irregularly dotted with Viola Yellow King, two with Mrs. Granger (bronze), two with Fancy Pansies, all having shades of the same colour, the remaining two being arranged with those having white edges and pale blue markings. The flowers were picked with long stems, which were inserted into holes made in the Lycopod with a pointed stick, and arranged in an easy undulating style, the centre of the flowers pointing in various directions, or nestling in pairs among the verdant green Lycopod. These circular arrangements were then placed upon the table wherever required to break the flatness, dishes of dessert being set between them and at the four corners of the table.

The whole of the dessert dishes, as well as the candelabra and the base of the epergnes, were traced around with beautifully coloured pieces of golden Honeysuckle, and dotted with dark blue Viola. This tracing also connected the dessert dishes with the whole of the ornaments used along the centre of the table. The effect produced by this method of arrangement was bold and striking when entering the room, and when sitting at the table the undulating surface of interesting groups was in itself a pleasing feature.

The following night the table was somewhat smaller, and silver ornaments were used exclusively. Strips of art silk of a soft yellow colour were placed across the centre of the table; these were 2 feet in width, the junctures being covered with small sprays of Golden Yew. The same material was placed all around the outer edges, taking care to have small sprays breaking the outline here and there, and wherever the cross lines met the outer ones those points were made much fuller. Pink flowers only were used on this occasion. A large bowl was arranged with pink Pæonies of a bright shade, such Fern fronds as those already mentioned, and a liberal admixture of the beautiful hardy Ribbon Grass (*Phalaris arundinacea variegata*) as well as field Grasses. Banks of moss, surmounted by a plant of *Dracæna Veitchi*, were formed near each end of the table, and lightly covered with Maidenhair Fern and Pæonies. Four silver vases filled with plants of the same variety of Fern were placed on either side of the candelabra, and four Kentias with Lycopod bases were stood in the open spaces intervening. Pæonies were then arranged on the tracing wherever the lines intersected, and a few sprays of Ivy-leaved Pelargonium Madame

Crouse dotted here and there around the tracing and dessert dishes. The Golden Yew and yellow silk formed a most pleasing combination of colour when seen under the influence of artificial light, and the whole arrangement was low, yet imposing and effective, and moreover a complete change from the preceding attempt. The subject will be resumed next week.—D.

CUCUMBER DISEASES.

ALTHOUGH I grew Cucumbers for the production of seed many years, yet it was always in frames, or if in houses at least on soil beds in a trailing fashion rather than on hanging trellises. For that reason perhaps, for I could not discover any other, my plants, or rather fruits, never suffered from that form of disease recently referred to, and which is in evidence in so many houses where Cucumbers are grown on trellises.

It has often been a matter for surprise to find fruits doing so badly where all conditions of soil and heat seemed favourable; indeed, it may be said, almost with truth, that miserable, imperfect fruits seem to be more the rule than the exception. Now, I had never attributed this marked defect to any *bona fide* disease; rather I had attributed it to some defect in the fruit organs, arising either from imperfect fertilisation or from absence of essential parts of the flowers. There are perhaps conditions in Cucumber houses which are not favourable to perfect organic production, perhaps too close an atmosphere, perhaps too damp, perhaps too hot and dry, generating red spider in the flowers, which destroyed the vital organs. Whatever it may be, this very imperfect development of Cucumber fruits is a common and troublesome matter, and does not seem to be easily overcome by even ordinary good growers; but if this defect is not common with the fruit of plants grown on the ground may the cause be traced to the method of growing plants in houses? It is very well known that fertilising the blooms is not at all essential to the production of good fruits for immediate use, but only for seed production, and blooms so fertilised seem, so far as my experience goes, never to fail in producing perfect seeding fruits. Does that fact tend at all to show that the very imperfect structure of fruits, so common with Cucumbers, must arise from imperfect floral organs; and if so, how is such imperfection to be associated with disease?

The only disease, if it might so have been fitly termed, with which I was troubled when growing Cucumbers for seeding was stem decay, and which always showed itself at a very critical time in the plant's life. That usually was when several fine fruits had set on each, and there was considerable strain on the plants to support them. Then, when the days were hot and sunny the leaves would flag, points of the shoots would become flaccid, and in three or four days the collapse was complete. I cured that trouble, which once was common, sometimes losing one-half the plants in that way, by planting originally as shallow as possible, for deep planting seemed to have been more productive of this stem decay than any other cause. In planting also I adopted the practice of inclining the plants so much, that when the branches rapidly developed there was no breaking down or undue bending of the main stem, which also aids to produce this form of stem canker or decay. Thus the evil eventually was greatly minimised. Even to plants that suffered from it I found great aid could be given by mulching the beds or soil with a coating of very short or decayed manure, as if shoots here and there were somewhat buried in the mulch roots would be emitted, and thus I have had plants producing heavy crops of fruit which have had to exist entirely on these layered branches, the main stems having entirely decayed.

Mildew on Cucumbers is more easily dealt with in heated houses, where the pipes can be well coated with sulphur wash, than in frames, whilst thrips and red spider are chiefly the product of neglect. Generally Cucumber culture is not difficult, and some growers always succeed in rearing perfect fruits.—A. D.

BULB CULTURE AT HOME.

REGARDING the question of cultivating spring-flowering bulbous plants in Britain, I have no doubt as to either its feasibility or to its being practical. For very many years I have made the cultivation of Lily of the Valley somewhat of a study, and with the ordinary forms, the stock of which I had alone to begin with, as with the Berlin variety, of which I have now a very large quantity of strong growths ready either for forcing or for flowering in the open, I do not think any foreign produce could be better; in fact, I have many times been told that our home-grown flowers

were much the best. The chief factor to securing this result has been simply to give the growths sufficient space for development, and to lift and give a change of ground every third or fourth year. Annual surface dressings of rich soil or of natural or chemical manure do the rest.

Very much, or perhaps to speak more correctly, exactly, the same remarks apply to the culture of the best Narcissi, to Tulips, and even to Hyacinths. For a few years past the latter have been grown in good soil instead of being planted out in the pleasure ground on grass, where they dwindled away to nothing but leaves. I find that after a few years to get over the bad results of forcing the spikes come in the open quite as good as many of those bought in for pot culture. Some sorts do better than others, as for instance King of the Blues is always specially good. Tulips do better than Hyacinths. A near neighbour (Mr. Porter, gardener to Lady Dalrymple, Leuchie) makes quite a speciality of Tulip culture, and not only flowers them in the open but forces them quite as successfully as bulbs bought in. The soil in this case inclines to clay. In ours it is open and light.

In the case of Narcissi I had an opportunity, during the season just past, of testing the relative value of Dutch and own grown bulbs, and I have no doubt whatever that the latter are quite as good as the former. Through the kindness of a friend I had bulbs of a few leading sorts from one of the best Dutch growers, and our own were in every respect as good. The sorts comprised Poeticus ornatus and bicolor, and of both of these three-year-planted bulbs produced flowers equally as good as, and foliage rather better than, the imported. The other kinds I could not fairly compare. But without having the best means of comparison there is no reason to doubt that equally good flowers and foliage of such popular sorts as Emperor, Empress, Sir Watkin, the double Incomparabilis section, all the forms of Poeticus, Cynosure, Stella, Telamonius, and others can be grown in this country.

The main point to consider in regard to Narcissi is not to allow the bulbs to get overcrowded. In the case of sorts which do not increase rapidly there need be no hurry in lifting for a number of years, only in this case provision must be made for feeding by means of surface dressings, applied either in autumn or early spring, the latter time being more suitable for the application of chemical manures, and the former for ordinary manure. Three years appears to be quite long enough to leave in one spot such prolific varieties as poeticus recurvus, biflorus, and poeticus fl.-pleno. The second year after planting the flowers appear to reach the maximum of size and vigour, and thereafter they decrease in size, and in course of time refuse to flower with regularity.

As it is not the purpose of this paper to discuss the general culture of these I pass on to notice other bulbous plants. Irises are deservedly popular, and of bulbous forms none are more useful than the English Iris. Home-grown plants of this, if managed in somewhat the same way as hinted at for Narcissi, attain a vigour and perfection which puts imported flowers completely in the shade. Of the quaint and lovely Spanish forms I cannot write with the same decision, as they have in the past displayed a tendency to dwindle away; but that may be on account of want of proper treatment, as they have not been cared for in the same way as the others. The Kämpferi varieties I have never tried, as I feared the dryness of our soil would be so prejudicial that they would never succeed; however, I am inclined to give them a trial.

Then Gladiolus The Bride may be so cultivated as to produce as fine or finer spikes than are obtainable from foreign bulbs, and to Montbretias the same remark is applicable. But of the generality of Gladioli there seems no reason to doubt that we cannot produce corms to come up to those grown abroad. I have tried these for so long, and so many times have had opportunities to test home and foreign corms side by side, that, leaving any particular method of culture aside, there seems no possibility of doubting the superiority of continental-grown bulbs.—R. P. BROTHERSTON.

SCALDING AND SHANKING OF GRAPES.

MUSCAT of Alexandria sometimes has the berries at the upper side of the bunches and on the side exposed to the sun more or less scorched. It is most prevalent after a period of dull weather. The sun acting on the house before air is admitted causes the atmospheric moisture to be condensed on the cooler surface of the berries, which do not heat as quickly as atmospheric air charged with moisture. The preventive is to admit air rather freely, especially in the early morning and through the day, with a little constantly in dull weather and at night, maintaining a genial warmth in the pipes so as to keep a temperature of 65° to 70° artificially. It is most prevalent towards the close of the stoning

period, just before Grapes change colour for ripening, preceding that about a fortnight to three weeks. The gentle warmth and free ventilation is sufficient for Lady Downe's—the variety most liable to scald, but Muscat of Alexandria beneath large panes of glass is benefited, especially in the northern parts of England and in Scotland, by a slight shade at this period and during the early stages of ripening, when the weather is very bright. A double thickness of herring nets drawn over the roof lights breaks the fierce rays of the sun sufficiently, and is most necessary from mid-June to early August.

Great deterioration of the crop is often caused by shanking, and it is in a great measure preventible. No one knows for certain by what it is caused, but various errors of management tend to induce and accelerate the disease. The first of these is an unfavourable rooting medium. Borders mechanically or chemically wroug never produce Grapes free from shanking, and Vines grown in natural soil suited to the Vines are least afflicted with this malady. It may arise through a deficiency of ventilation in the early stages of growth, combined with too much moisture, inducing long-jointed growth and thin foliage, especially when the roots are deep in a favourable rooting medium. Properly made borders and well managed Vines are necessary to avoid shanking. The foliage must be fully exposed to light and air whilst it is forming, no more growths being allowed than can have those essentials, which are important for a steady supply of nutriment and its proper assimilation. Encouraging root action by a thicket of growth, which must sooner or later be removed in quantity, is the way to accelerate the disease by producing a check and causing a stagnation of the vital forces when it is most necessary that they should be active for elaborating the crude substances and converting them into assimilable matter. By keeping enough foliage in a healthy state to maintain the supplies of nutriment from the starting of the Vines until the fall of the leaf, and no more, shanking may be reduced to a minimum. Vines prone to shank should be given time, sudden fluctuations of temperature be avoided, giving particular attention to ventilation, especially early, and adopting the extension rather than the restrictive system.

Overcropping favours shanking through needlessly impairing the energies of the Vines. Whatever weakens the Vine tends to render it an easier prey to disease, but weakly healthy Vines shank the least; the sappy and long-jointed Vines often shank on the stem of the bunch. Get, therefore, all the chlorophyll possible into the growths by regulating them so as to expose all to light and air, not occupying all the space at once, but leaving some for lateral extension, and by keeping this stopped, so as to cause an equal and steady flow of sap, as much freedom from shanking as it is possible to secure may be attained. It is only by judicious treatment that health can be preserved and shanking reduced to a modicum.—G. A.

ANEMONE CORONARIA.

WHILE visiting the Bath and West of England Agricultural Show at Swansea a short time since I took the opportunity of calling on Mr. Harris, nurseryman, Blackfield, to see his St. Brigid Windflowers. Mr. Bull, jun., of Chelsea, who had seen them a few weeks before the Show, told me they were the finest he had ever seen, and that they were well worth going to see; and I must say I never saw a better lot of Anemones anywhere for size, shape, and colour. The plants, which were 3 feet high, formed an edging on both sides of a long gravel walk, and were a mass of flower from end to end. The flowers individually were of great size and substance, both double, semi-double, and single, many of them resembling large Pæonies, while others were cupped like Tulips, and some assumed the form of Poppies and Japanese Chrysanthemums, their colours ranging from the deepest scarlet to almost pure white, and from a beautiful blue to a deep purple.

Anemone coronaria and its varieties have been cultivated in this country from an early period. It is a native of the Levant, and was introduced from Holland in 1597, and yet it is surprising that a plant so useful for cut flowers is not more grown in private establishments, where there is a great demand for flowers at all seasons. It is easily cultivated, and with a little attention in planting it may be had in flower for six months in the year.

Mr. Harris sows the seeds outside, in a bed of moist loam, some time in June, and when the plants are sufficiently large to handle the strongest are picked out (7 inches apart) in the position where they are to flower the following year; the others are allowed to ripen their tubers in the seed bed, when they are dug up and stored away in boxes in a cool dry place till planted again in October, January, or even later, according to circumstances.—A. PETTIGREW, *Castle Gardens, Cardiff*.

NOTES ON THE NATIONAL.

PERHAPS no exhibition of the N.R.S. was ever looked forward to so much as that held at the Crystal Palace on the 2nd inst., and this on account of the number of uncertain elements by which it was attended. First of all, the weather of the preceding six months had been variable and trying to a degree, and no one could tell exactly what were to be its effects upon the quality and quantity of the blooms. Intimately connected with this was the very early date of the Show, and these two factors gave rise to numberless questionings beforehand. Would the southern growers sweep the boards, or would their blooms be over and the Midlanders carry all before them? Would A be ready or B be out? or would C be the victor of the year? And so on.

When the eventful day arrived the results proved as mixed as those of the general election. In the great trade classes the northern champions, Messrs. Harkness, were unable to show, and the famous Colchester growers triumphed, the junior taking the trophy, while the senior captured both the silver medals. But in the amateur division the very opposite was the case, for if Mr. Lindsell's situation is not altogether a northern one it is far more so than that of his doughty opponents, Messrs. Budd, Slaughter, and West, while Mr. Baker was conspicuous by his absence. And yet it is an open secret that only three or four days before the Show Mr. Lindsell had scarcely a bloom ready, while on the day he achieved a "record" triumph, winning the trophy for the third time consecutively.

Another distinguishing feature about this year's Show was the absence, for the first time in the history of the N.R.S., of all fourth prizes, and the only opinion which seemed to find any expression was one of unmixed dissatisfaction. There was a proviso that where exhibits were numerous and of good quality extra prizes might be awarded, but that was treated as a dead letter by the Judges. The exhibits were numerous, nineteen, thirteen, ten, and nine boxes being staged in some classes, and the quality was fully up to the mark, but not one extra prize was awarded. These fourth prizes must certainly be replaced another year, or the best interests of the Society will suffer. Already one grower who assisted at the formation of the Society, and who has exhibited at every one of its shows, has withdrawn from membership, and others threaten to follow his example. Several of our veteran amateurs began with winning a fourth prize, and encouraged by that small success have gone on to greater things, while if no award had been gained they would, very likely, have been discouraged and have given up.

But the most interesting feature of all was the division of the amateur portion of the Show into sections, in each of which only those of (approximately) equal strength were allowed to compete, and the result of this experiment proved eminently satisfactory. Two points were strongly urged by Messrs. Bateman, Grahame, and others in their prosecution of the scheme before the annual meeting, viz., that many new members would be added to the Society, and that from them, and existing members, many new exhibitors might be expected, and these two contentions were proved up to the hilt. One local secretary was able to send up twenty-two subscriptions, another sent thirteen, and several others smaller numbers; while several old members, who had grown tired of the unequal fight, were induced to renew their membership, and were found competing, with better success. As to increased competition the large number of boxes, more especially in the smaller classes, bore unmistakeable testimony to a lively appreciation of the revised conditions. The boxes of twelve, nine, and six of a sort, in the respective divisions also, formed quite a show in themselves, and added greatly to the beauty of the Exhibition.

One most pleasing incident of the day was the re-appearance (as a Judge, but not yet as an exhibitor) of Mr. W. J. Grant, after his terrible accident, with its long weeks of subsequent suffering. Many and hearty were the greetings that he received upon his wonderful restoration, and the greatest satisfaction was expressed that so able a rosarian and such a *bon camarade* has been spared to us.—J. B.

THE WATERING OF PLANTS.

[A paper read before the members of the Liverpool Horticultural Association by Mr. B. CROMWELL, gardener to T. Sutton Timmis, Esq., Cleveley, Allerton.]

PLANTS, whether rooted in the soil, floating in the water, or suspended in the atmosphere, are dependent upon air, moisture, heat, and light for their perfect development. We all know that water is one of the chief necessities of life, and one essential for the activity of all living agents in animal and vegetable life. By its application to plants it increases and quickens their vitality, and enables them by means of certain organs to absorb and assimilate food consisting of elements necessary for their growth and increase. A most important condition for healthy plant growth is a perfectly aerated soil. Porosity in a soil always tends to the oxidation of organic nitrogen, converting the insoluble and unseen substances into soluble, and easily assimilated or digestive food.

Heat is another prime factor acting on the soil, hence plant growth is much more energetic in a greenhouse, where the degrees of warmth and moisture can be better regulated, than in the open garden. The cultivator must remember that the conditions in a stove or greenhouse are artificial, and these are some facts which every gardener ought to understand perfectly, but which are, nevertheless, often misunderstood. The most important point to be remembered is, that warm air takes up much more moisture than cold air does, and hence the liability of plants to be dried and scorched on a very cold frosty night by what we call fire heat. The heated air from the pipes dries the plants, and it is dried in turn by contact with the cold glass, which robs it of its moisture, the cold glass acting as a condenser. I mention these facts as having a very important bearing on the watering of plants in pots, and affording atmospheric moisture when it is necessary to increase the temperature by fire heat. To counteract the drying tendency of extra fire heat we sprinkle the floors and stages of the houses with manifest advantage.

I am of opinion that firm potting has very much to commend itself in connection with the watering of plants. When a firmly potted plant requires moisture the water when applied gradually passes through the soil; the plant will then not show signs of distress so readily as one in looser soil, through which the water rushes almost as fast as it is poured in. The soil is left loose in order that the roots may penetrate it freely. They may do so by rambling through it, and become long and fibreless; but matted fibry roots are the most satisfactory, and these are only produced in firm soil. The leading roots have to fight their way through such soil, this causing them to produce innumerable fibres, which are the life of the plant. I am of opinion that the more difficult a plant is to grow the more important it becomes to have it established in firm soil. The result of potting an Azalea, Heath, or any other plant having very fine hair-like roots in loose soil is usually disastrous through the constant watering needed, and the water passing through so quickly often washes the soil into the drainage, thus rendering the whole of the compost in the pots sour. I may say that the benefits of firm soil are confined to no class of plants, but apply to kitchen garden crops, plants in pots, also Vine and fruit tree borders. Due care must be exercised to find out the true condition of the soil, and if a plant requires water twice or thrice one day, that is no reason why it should need as many applications every day. A change in the atmosphere, the amount of moisture, or the growth of a plant may determine the necessity of a greater or less supply. If there should be any doubt about a plant requiring water, I have invariably found that the best and safest course to follow is to allow the plant to become slightly drier than at previous waterings, and by watching closely the effect this little variation has on the appearance of a plant a useful lesson will be learned and a guide to future applications acquired, for so changing and varied are the conditions under which watering has to be conducted, that even experts—men of long practice—must be students to be generally successful.

When once the soil becomes thoroughly dry no ordinary watering will rectify the mistake; even with three or four applications, the water will pass through the pot without wetting the soil in the centre. The only perfect way of watering over-dry plants is to plunge them over the rims in a bucket or tank of water, and allow them to remain for an hour or more. The water then moistens the whole of the soil, and there is no difficulty in watering in the ordinary way afterwards. While mentioning the fact of plants becoming excessively dry during the period of growth, it occurs to me that we are sometimes led to make mistakes in watering by a practice which is not uncommon to most of us—viz., top-dressing plants. Probably this might be carried out much more extensively than at present, but whether it is a good plan, except in a few particular cases, is an open question. There is, I think, this objection to top-dressing, when the surface soil is removed from over and amongst the top roots, and new soil

added in its place, it is somewhat difficult to ascertain the true condition of the lower part of the ball with regard to moisture. The old soil will dry sooner than the new, or *vice versa*, much depending on the nature of the plant, the state of its roots, the mechanical condition of the old and new soil, and on the density of both. Under such circumstances judicious watering becomes a difficult matter, even in the most careful and experienced hands. I think perhaps an occasional dressing of some artificial manure would be preferable where it becomes necessary to keep plants for a long time in small pots.

HOEING VERSUS MULCHING.

UNDER the above heading "E. H. M." takes an opportunity to criticise a brief note of mine which appeared in the Journal for June 16th (page 455), under the heading of mulching. In the concluding lines of that note I said that "without incessant watering or heavy mulching it is impossible to obtain satisfactory crops from light shallow soils in dry hot summers." I repeat and emphasise that statement here, and in doing so I may say that no man sets a greater value on the good resulting from the frequent stirring of the soil between the young crops of Onions, Carrots, Parsnips, Cabbages, and others with the Dutch hoe than I do; and I have frequently advocated the practice in the horticultural press, as the stirring of the soil from 1 to 2 inches deep between the rows, according as the soil is heavy or light, not only destroys weeds, but at the same time accelerates growth in the crops.

"E. H. M." is anxious to know whether gardeners in general agree with what I have said in favour of mulching. He says, "For my own part I must say that I have greater faith in the constant use of the hoe." That being so, I will ask your correspondent whether he ever mulches his rows of Peas and Beans or wall fruit trees, and if so, for what purpose? Should he pay me a visit—and the journey is not, I think, a long one—I can show him rows of Peas which were heavily mulched as soon as they were planted out, earthed up, and staked, and from which we have been gathering good supplies of large well filled pods of Carter's Telegraph, Anticipation, and Sutton's Royal Jubilee, the first mentioned variety, since the middle of June, our previous gatherings having been obtained from earlier varieties. The plants are in fine condition, the haulms vigorous and heavily laden with produce, which is admired by all gardeners and others visiting here.

Anyone having a light and shallow soil can very easily test the matter for himself by sowing a few rows of Peas and Beans, half of which should be mulched and the other half not, using the Dutch hoe along each side "constantly" instead, as recommended by "E. H. M.," and note the results, which I fearlessly assert will be immensely in favour of mulching; the produce will not only be finer and of better quality, but also will be of longer duration. I have not in the smallest degree exaggerated the efficacy of mulching crops of Peas and Beans, Tomatoes, and fruit trees growing in "light shallow soils in dry hot summers." "E. H. M." says in the concluding lines of his note that, "it may be impossible for me to obtain satisfactory crops under the conditions which I specified," adding, "but it is not to others." I may remind him that perhaps what he looks upon as being satisfactory crops might be considered unsatisfactory by some others of the craft.—H. W. W.

IN reply to "E. H. M.'s" inquiry on page 494 of the *Journal*, I for one do not believe in the mulching of growing crops of vegetables, but prefer the free, yet careful, use of the hoe as often as required, so as to keep the surface crust broken. This admits air to the soil, and thus stimulates and encourages root action and consequently a free growth. Certainly permanent fruit plantations, such as Strawberries, Raspberries, and other small fruit, also pyramid Apple, Pear, and other trees are better mulched early, to supply food to the trees, and also to encourage the production of roots near the surface. But whoever has tried the two ways named on the growing crops in the gardens under his charge, and who has taken the trouble to observe and carefully note the different results from each plan on such vegetables as Carrots, Onions, and the Brassica family, in fact all annual growing crops, also bedding plants, cannot but admit that the free use of the hoe to lighten the soil is valuable in encouraging growth. One can almost see some vegetables grow after the application of the hoe amongst them; and if it were more freely used amongst Carrots and Onions at the proper time we should hear less of the Onion fly and Carrot grub. Many gardeners have the will to do these things at the proper time, but unfortunately they have not enough men at hand to keep pace with the work in the busy time, and consequently the success they so much desire is partly lost through no fault of their own. My advice is, Mulch fruit trees early, and apply the hoe as often as possible amongst all vegetables.—JOHN CHINNER.

A "CLIMBING" SALVIA.

YOU have on two occasions given me information respecting horticultural shows, and now I venture to trouble you again, as I wish if possible to obtain seed of a scarlet flowered "climbing" Salvia. Some twenty years ago I was employed in a gentleman's garden in Huntingdonshire, in which was an old-fashioned conservatory. Planted against the back wall, and trained partly over the roof, was a scarlet flowering

plant, which I was informed was a *Salvia*. It was nearly always in bloom, though by no means so floriferous as *S. splendens*, and was perhaps what some would term rather "a weedy thing;" still I always admired it, and finding how well the *Salvia* family did in this country I resolved to try to obtain the old friend. Accordingly I wrote to a relative of mine who had been head gardener at the place at that time, asking him if he remembered the plant, and if so would he try to procure seeds for me. In reply he sent me a packet of *Salvia splendens*. I felt certain that this was not the variety I wanted; for, although unfortunately there is considerable confusion respecting the names of some plants imported in years gone by, I had little doubt about *Salvia splendens* being true to name, and the event proved I was right, the plants from the imported seed being identical with those I already had.

I have never seen this climbing variety elsewhere, and after this lapse of time cannot pretend to give a very faithful description of it, but perhaps the following data may enable you or some of your readers to identify it:—The plant in question seemed to possess a true climbing habit, and must have been at least 12 feet high; the stems were similar to those of *S. splendens* but thicker and more rounded; the leaves were heart-shaped, double the size of *S. splendens*, and resembling in texture those of *S. patens*, but of a lighter green. The flowers were borne in large racemes, and were of a brilliant scarlet colour. When touched the leaves emitted a strong and somewhat disagreeable odour. I have gone carefully through the *Salvias* mentioned in "Johnson's Gardeners' Dictionary" (a most valuable book by the way, and one I should not like to be without), but fail to see anything answering to this climbing variety. Another old-fashioned plant which I do not see advertised in the nurserymen's catalogues, but which I should like to obtain seed of, is *Diplacus glutinosus*. If I remember rightly I once saw some cultural directions about this plant in the *Journal*. We had a plant or two at one place where I lived in England, but that collection has been dispersed long ago. In conclusion, to show you what a beautiful object a bush of *Salvia splendens* is in this country I may mention that there is in the park here a plant nearly 6 feet high and about 7 feet through, which for some months has been one mass of bloom, and will probably be so till it dies of exhaustion.—H. FAIRY, *Public Park, Uitenhage, Cape Colony*.

SINGULAR ABUNDANCE OF THE GAMMA MOTH.

IN the current number of the "Entomologist" Mr. Adkin gives an interesting report of the observations made by himself and others upon the sudden appearance of the gamma or Silver Y moth (*Plusia gamma*) in the vicinity of London this summer. From sundry scraps in newspapers and other local journals it seems that the insect made similar displays elsewhere, and not merely in South Britain, for it has been reported from many parts of Scotland, and localities, too, where it had been previously almost unknown. From Essex, a correspondent writes that the moth was seen by thousands; in Yorkshire, we are told, the fields of some districts were alive with them. About the metropolis the profusion of the species was such as to attract the notice of many persons not entomologically inclined, and he naturally concludes that, unless some special interference prevent their increase, we may expect a host of caterpillars soon, and, perhaps, a yet greater abundance of moths during the autumn.

Near London, they first appeared conspicuously on May 24th, and, despite the thunder showers, they remained on the wing till about June 10th, after which date few were noticeable. In other localities the period of flight was much the same, about the last week of May and the first week of June, after which they vanished generally, but along our fields and hedgerows in the neighbourhood of Gravesend I observed stragglers till nearly the end of last month. At present I have not discovered any of the young larvae, they are probably just beginning to hatch out, and in another fortnight they will perhaps be too visible.

It is a peculiar larva or caterpillar, that of the gamma moth, from its having a formation which makes it adopt a walk like that of the "looper" or the geometer tribe. In colour it is of a leafy green, and has a few streaks of white and yellow. Mr. Adkin captured many specimens of this moth, and found them mostly in good condition but rather pale in colour, a fact suggesting that they had not recently emerged from the pupa, also he noticed a preponderance of females. It is supposed that usually the species hibernates as a moth, appearing in the first warm days of May, but there was no abundance of the insect at that time, nor was it numerous last autumn. His conclusion is that these moths were immigrants that had arrived hither from the Continent; if this be so, it is remarkable how speedily they spread themselves over the British islands. But it must be acknowledged that we have as yet no proof that such moths can travel hundreds of miles on the wing.

With regard to the history and habits of the gamma moth, as these affect gardeners, it may be added that it is one of those often observable in bright sunshine, and after dark it is easily attracted by light or sugar. The caterpillar is a very promiscuous feeder. Of late years it has not been particularly troublesome in Britain, but at one time it did much mischief to Peas and Cabbages. On the Continent, where it is often very abundant, it frequently lays gardens waste, advancing from plant to plant till it leaves bare shoots or stems. The French call the species the "pot herb moth," and dislike it, specially from the idea that it communicates an unwholesome quality to anything it feeds upon or crawls over. I have seen the caterpillars devouring the leaves of the

Chrysanthemum in August, that being the month when they are chiefly to be noticed. A sharp look-out will have to be kept for them during the next few weeks, for there must have been many eggs deposited, and if the season is not a wet one they will thrive rapidly.—ENTOMOLOGIST.

SARRACENIAS.

(Continued from page 4.)

THE hybrid *Sarracenia* raised so far have all been produced in British gardens, Messrs. Veitch & Sons, W. Bull, Swan, Paterson, and Moore of Glasnevin being the principal raisers. The species

FIG. 1.—SARRACENIA PATERSONI.

intercross freely, and the seeds germinate readily if sown in heat and kept very moist. By crossing the comparatively hardy *S. purpurea* with the larger growing species some very distinct and handsome pitcher kinds have been obtained, such as *S. Swainiana*, *S. melanorhoda*, *S. Atkinsoniana*, *S. Chelsoni*, &c. These are all remarkable for width of pitcher and depth of colour, as well as for sturdiness. *S. purpurea* is a hardy plant in the warmer parts of England. I have seen fine tufts of it in the rock garden of Messrs. Backhouse & Sons, York, and it is exceptionally well managed in

the open air in Sir E. Loder's garden at Horsham. Grown in a peat or sphagnum bog in a sheltered position exposed to plenty of sunlight *S. purpurea* is quite at home. It is, of course, equally good under pot culture.

S. Patersoni (fig. 4) is the result of crossing *S. purpurea* and *S. flava*, the parents of *S. Stevensi* figured last week, and although the two hybrids are very similar to each other they differ in form of flower and in the colouring of the pitchers. *S. Patersoni* was raised by Dr. Paterson, and exhibited by him before the R.H.S. about seven years ago. Its pitchers assume in autumn a rich deep claret red colour with veins of a darker hue, and they are 2 feet long. I consider this one of the very best *Sarracenias* yet raised. Its flowers are as large as those of *S. Stevensi* and coloured deep crimson. *S. Chelsoni*, raised by Messrs. J. Veitch & Sons from *S. purpurea* and *S. rubra*, has pitchers similar to those of *S. Patersoni* but darker in colour. All the hybrids of which *S. purpurea* is one of the parents are remarkable for depth of colour. By crossing it with the elegant beautifully tessellated *S. Drummondii*, a hybrid of exceptional merit as regards colour, but not first-rate as a grower, was raised a few years ago and named *S. Mitchelliana*.

S. Drummondii is perhaps the handsomest of the species, its erect pitchers, 2 feet long, closely reticulated with white on a green ground and splashed with crimson, wholly crimson inside, being produced freely first in spring and again in August if the plant is properly treated. Its flowers, which are rich vinous crimson in colour, are fully 4 inches across. There are several named varieties of it—viz., var. *alba*, with more white in the pitchers than in the type, and the flowers paler in colour: var. *undulata*, darker in the colour of the pitchers; var. *mexicana*, &c.

S. rubra is another species with long narrow pitchers, green, with purplish veins, and flowers coloured brown crimson. It is not nearly so ornamental as some of its progeny. The singular little *S. variolaris* with its short pitchers, hooded at the top and coloured green with a creamy mottling, is worth growing for its pitchers as well as for its elegant pale yellow flowers. By crossing it with *S. psittacina*, another short pitcher, prettily marked species, the hybrid known as *S. formosa* was obtained by Messrs. J. Veitch and Sons, and by crossing *S. psittacina* with *S. purpurea* one of the most beautiful of the smaller *Sarracenias* was raised by that skilful and urbane Veitchian propagator, the late Mr. Court, after whom the hybrid was named. *S. Maddisoniana* sprung from the same parents as *S. formosa*, and the distinct prettily marked *S. Swaniana* from *S. purpurea* and *S. variolaris*. The prettiest of all the *psittacina* or Parrot-like set of hybrids is that named *Wrigleyana*, raised in the gardens at Bridge Hall, Bury, and distributed by Messrs. B. S. Williams & Son a few years ago. Its parents are the same as those of *S. formosa*, but the pitchers are much finer, being from 12 to 15 inches high, curved and hooded so as to suggest the allied *Darlingtonia*, bright green mottled with almost transparent white and veined with crimson. I have read somewhere a statement to the effect that the parents of this hybrid are *S. Drummondii* and *S. psittacina*, but this is surely a mistake.—W. W.

(To be continued.)

THE ARTISTIC AND EFFECTIVE ARRANGEMENT OF PLANTS AND FLOWERS.*

DURING the past ten years marvellous strides in the way of improvements in the artistic and effective arrangement of plants and flowers have been made. For myself, I can clearly see these changes and rejoice in the knowledge of them, and I feel that to those who helped to bring about these changes for the better our warmest thanks are due. In studying our subject we must look straight to Nature herself, and there learn an object lesson. When we take a survey of some of our lovely woodland scenery in the summer and autumn months, we do not see anything of the conventional or formal type; but everything seems arranged with a delightful ease, nothing seems to clash: the colours of the flowers blend beautifully, their foliage is in perfect harmony, the fine overshadowing trees above us and the mossy ground beneath our feet, all tend to make the scene of natural wealth, which Nature so lavishly provides, one which we can enjoy and feast upon. Take again the banks of some of our rivers. The scenes at certain points are enchanting. What with the Iris, Water Lilies, and other flowers, Rushes, and river grasses, backed up by wild Dog Roses, Elders, and many other trees, we see Nature's arrangement in perfection. We get no hard pruning of the Rose, no cutting into a pyramid or round shape of the Elder, but we have them presented in their natural form with long flowing branches thickly studded with beautiful flowers. In rowing up the Thames between Caversham and Pangbourne I have often enjoyed the sight of these lovely pictures. I am fully persuaded that

those who would succeed in the artistic and effective arrangement of plants and flowers must have a love for the natural and strive to follow Nature's laws and ways. If we do this our march will be in the right direction.

I turn now to some remarks upon several items which seem foremost in my mind. First is one which concerns all of us to a more or less degree—that of plants and flowers for house decoration. The English as a nation have a love for flowers in their homes, and I advocate the greater use of plants for house decoration than is at present practised. Take a large hall and wide staircase. What a charming appearance flowers and Palms have, little groups being formed in the angles of the staircases, at the ends or in the niches of the corridors, with here and there a hanging basket of Ferns! Again, in the reception, drawing, and dining rooms plants might with advantage be more employed, always taking care that the arrangement is in harmony with the surroundings. Palms and other light feathery plants should always be used to give a light and artistic effect. The red pots in which the plants are growing should always be hidden from view, either with moss, Maidenhair or other Ferns. I cannot admire many of those brilliant coloured cachepots which we see so much in use; they detract from the appearance of the plant in my opinion. There are some lovely tints to be found in art silks which have a charming effect draped around the pots.

In dinner table decorations there is a great field for artistic persons, and I suppose more thought and attention are given to this than other branches of floral art, but there is room for much improvement.—First in the design of the epergnes employed. Those good people who design these seem to my mind in nine cases out of ten to miss their mark. They design something very handsome and in many cases chaste and artistic, and the article produced must certainly be called a work of art; but when we come to put our flowers in them we find they are defective and the whole effect is not what we could wish. The reason is, I believe, that the designer is not a floral artist, and consequently does not know what is really required to show off flowers to perfection. Epergnes in general are not made light and artistic enough. Presuming we may have obtained the ideal epergne, dressing must occupy our attention. The flowers used should be small, delicate in colour, in perfect harmony with each other, and of chaste appearance; larger flowers may be used in the base of the epergne. If Maidenhair Fern is used it should be of a pale green colour. Trails of *Smilax* are very pretty if carefully and lightly used. The *Asparagus* foliage is also charming, and can scarcely be dispensed with if we want to get the best appearance. A well dressed epergne is not to my mind often seen. It should have a fairy-like appearance whatever be the flowers used, and look as though hands had never touched it. The blending of colour and the whole balance have to be perfect to present an ideal arrangement. Having thus dealt with the epergne, which is the most important part, I will only add that the specimen glasses should be filled to correspond. When one has epergnes on the table I never advise having any flowering plants whatever, but if there is room, that attractive *Palm Cocos Weddelliana* may be employed; it is the best table *Palm* we have.

I shall probably be expected to say something about church decorations. This is a wide field and a subject that would occupy a whole afternoon if we went anything like fully into it. There not being two churches alike, it is somewhat difficult even to give a general outline of what course should be pursued. Plants in pots, to my mind, are not sufficiently used. In many cases a very formal appearance is presented, but, on the other hand I cannot agree with the elaborate use of large Palms, and placing them on the top of the pews, as is sometimes the case when decorating for a wedding. If Palms are employed it should be to form a series of arches up the central aisle from the entrance to the communion steps, a wonderful effect being thus produced. The style of the windows should influence and guide the artistic treatment of the decorator. Trails of Ivy seem indispensable. Arums never seem so much in character as when employed in decorating a church. In some churches I have seen small zinc flower holders containing water and supports for the flowers and Ferns used; these if effectively filled and hung around the choir stalls, pulpit, &c., produce a pretty effect. Ferns may be extensively used in this work, the common wild Fern *Filix-mas* seems especially adapted, although it may be a little stiff. Coloured flowers must be used with great caution, in fact scarlet is about the only one that should to any extent be employed, though harmonies in yellow are popular. Many ladies seem to have a special love for church decoration. In their hands frequently we see very pretty results, but sometimes there is a want of harmony, owing, perhaps, to the fact that one does this portion, and another that, and so on. It would be better that in these cases a harmonious plan be thought out, and all help to bring it to completion.

Leaving church decorations, I want to carry your mind away to the artistic and effective arrangement of plants and flowers at shows, and this is one of the most important parts, if not the most important part, which I have to deal with. I maintain that there is room for immense improvement. People have said to me, "I do not care to go to the flower show, there is so much sameness in it." I regret to acknowledge that there is a great amount of truth in this, but it should not be so, when we consider for one moment the inexhaustible supply we have in the varieties of plants and flowers. One of the first faults I have to find is that the compilers of schedules of shows will copy each other. Why not each try and have some amount of originality, strike out a fresh line, and get out of the old rut? "But suppose we do," someone says,

* Extracts from a lecture delivered by Mr. G. PHIPPEN at the International Earl's Court Exhibition on May 27th.

"others will follow, and then we shall soon get into the same state of sameness." All I have to say is this, keep striking out afresh, and the more that is done the more openings will be before us.

(To be continued.)

CHRYSANTHEMUM NOMENCLATURE—THE JOHN LAMBERT TEST CASE.

PERHAPS I was not quite so ignorant as might be supposed about the Alverstone case cited by Mr. Lambert. I thought he had better bring it out himself, and he has done so at last, evidently with some reluctance. I could wish for nothing better than this as a "test case" for determining the distinctness or otherwise of the variety John Lambert.

Herc are the facts. Emily Dale Improved and John Lambert were staged as distinct varieties by Mr. Agate. The stand was disqualified because it contained them. Who were the Judges? Men, I venture to say, at least as competent as Mr. Lambert is, and naturally less prejudiced—namely, Mr. C. Orchard and Mr. J. Wills.

Mr. Agate, like the acute exhibitor he is, took advantage of a technical point. The judging, he pointed out, had to be conducted according to the N.C.S. catalogue of 1889, which was compiled before the supposed "new" varieties were sent out. He therefore asked the Committee for the prize, and the Judges were requested to award it to "avoid unpleasantness." The executive were told that they must do that on their own responsibility, as they (the Judges) regarded the two alleged varieties as identical.

Mr. Agate writes:—"I got the prize, but have never staged them both since on the same board."

Did Mr. Lambert know the whole facts of this solitary case, and therefore hesitate to bring it forward? He has done so, however, and burst the bubble effectively, thus aiding me in the only object I had in writing—a wish "to avoid confusion in nomenclature."

Mr. Lambert in a former issue asked why I took blooms to Chiswick from the plants grown from cuttings which he sent me instead of those from my own Golden Queens or Emily Dales. I should have thought the reason was obvious—because they were just as good as mine, and I wanted the opinions of the best growers and judges on them. These I obtained before staging, and they were unanimous against John Lambert being admitted as distinct.

In conclusion, Mr. Editor, I enclose for your inspection a letter received from Mr. Agate, and from which I have quoted in the present communication.—E. MOLYNEUX.

[Our correspondent has quoted accurately, and unless Mr. Lambert can give references to other cases where the varieties which he claims to be distinct have been staged together, and admitted by judges as dissimilar, this controversy must cease or be postponed till November.]

LOAM VERSUS TURF.

Do we not, as gardeners, use the word loam in a wrong manner, I mean more particularly as applied to potting soil? It has struck me that we do. What the general body of gardeners mean by it is the turf which is cut at various depths and used as the staple article in potting the bulk of plants. Now loam, according to the correct definition, is something different to this. It is a mixture of sand and clay, styled light or heavy, according to the excess of either of these ingredients; therefore, to be correctly called loam, both sand and clay must be present. I hardly think they are so sufficiently to justify the term employed in all potting soil, at any rate. What we, as gardeners, mean by loam is turf cut from a pasture, roadside, or the "downs," varying in thickness according to the rooting depth of the grass. In the majority, I may almost say all, instances sand and clay do not exist in the turf as thus cut for potting purposes. It is not possible, because there is simply a mass of fibrous matter, particularly in that which is considered the best for the purpose. If what I here advance is correct we ought to adopt a new name; for instance, decayed turf would be more appropriate and accurate than loam. Turf, either decayed or green, constitutes the major portion of potting soils for the bulk of plants other than those of a hardwood character, and it varies in quality so much that special means have to be employed to render it fit for meeting the wants of the plants for which we use it. Thus it may be of interest to pen a few remarks on the subject of preparing soil for potting, although reference has been made to it in previous issues of the Journal.

Turf taken from the downs is generally the least fertile, owing mainly to the subsoil being usually chalk, and that so close to the surface as to render the soil which overlies it exceedingly poor, and also from the fact that such grass land—if it can be properly termed such—hardly ever obtains any manure. For fifty years the same downs have

been covered with grass, which contains a good depth of fibre, but as poor as it possibly can be. Turf of this kind is often employed for potting purposes, and as it possesses nothing but fibre, how to make it more productive is the point I have in view. It is useless to wait until employing it for potting before we enrich it, as then there is scarcely time enough for the plants to assimilate the food from it which it ought to contain. The best method of dealing with turf of this kind is to cut it about 1½ inch thick, make it into a stack about three months before requiring it for use, and between each layer of turf spread a thin coating of cowdung. Failing this, sprinkle finely ground bones, or what is perhaps better, pure dissolved bones, not those sold as compound bones. In making up the stack give it a gentle slope towards the middle to admit of the whole heap being well soaked with liquid manure occasionally, which enriches the turf much more than is generally supposed.

Turf which is inclined to be heavy coming from soils inclining to clay should have slightly different treatment. Instead of employing cow manure substitute horse droppings, and add also wood ashes, which greatly improves heavy soils. Dissolved bones are good for this kind of turf, also adding to its fertility considerably. I consider that it is a mistake to cut and stack turf, say one year before required for potting. Much of that which is considered essential to success—the fibrous part—becomes too much decayed to be of any real service before the roots of the plants it is intended to benefit have an opportunity to take possession of it thoroughly. In my opinion all the time necessary is that which allows for the decay of the grass after being stacked to prevent its growth when in the pots or where employed.—E.

FORTUITOUS AND DEFINITE VARIATION.

I HAVE never been able to perceive satisfactorily to my own mind the distinction between definite and fortuitous variation. For the purposes of this discussion, I will assume that we all mean by definite variations those that come in such a regular order as excite no surprise to see, while fortuitous variations are those so unusual and unexpected that they seem to be influenced by some force less regular in its operation.

In my nearly half a century of studies among living plants, I have been brought face to face with what under my definition I should consider fortuitous variations. In English literature numerous instances are recorded of Nectarines pushing out from the branches of Peach trees. There can be no reason for supposing that anything in the "conditions of environment" in an English climate could operate on one Peach branch more than another; but could that be granted, we find the same event occurring in many parts of the American continent, where the conditions are so numerous varying. Purple-leaved varieties, cut-leaved varieties, entire-leaved forms of cut-leaved species, weeping varieties—the numberless forms as distinct as species, which we find in nurserymen's catalogues—spring fortuitously in the seed beds of nurserymen, among thousands of plants with the definite characters, with no intermediate connecting links, nor under any pressure from environment that anyone can conceive.

And just in the same manner do striking variations suddenly appear by bud-variation as by seeds. The curled-leaved Weeping Willow suddenly assumed this character on a tree of the ordinary kind; the Red Sweet Potato is also a bud-variation from the ordinary White variety; the double-flowered Tuberose is believed to have originated by bud-variation; most of the many beautiful forms of Bouvardia cultivated by florists have had a similar origin. Numbers of popular florists' flowers have been propagated from branches that have been cut from plants on which they had taken their sudden and remarkable departure from the normal forms. This is especially the case with Roses, a number of those in general cultivation having originated in this way. These departures are not merely relative to colour; but habit and foliage change as completely as if they were distinct forms raised from seed. Some of a dwarf weak habit, like the Tea Rose *Devoniensis*, will send out a branch of great vigour and distinct appearance, which it retains so definitely afterward that many thousands are propagated annually and sold for cultivation by florists.

It will be noted that in these cases of striking variation by single branches taking a departure from other branches, the origin must be from a single cell. And we must look even beyond the cell to the original protoplasm, and believe that the special character of all subsequent growth is an essential part of its characteristics. We can associate nothing that enters into the conception of fortuity with facts like these. Accidental as these sudden and striking variations appear to the popular mind, science would seem to look to some definite arrangement of organised protoplasm as the only force capable of bringing about the results.

I have thus briefly outlined what I regard as salient facts favouring the theories of both definite and fortuitous variation. To my mind, it would be unjust to science to ignore the existence of either one of these forces. We have not yet the remotest conception how they operate on the protoplasm forming the definite cell. They may eventually be found to be but varied manifestations of the same power. But while we are arguing on the separate nature of these two forces, it seems to me we have to concede considerable power to both, with by far the larger influence, at least to my mind, to definite variation.—THOMAS MEEHAN
State Botanist, Pennsylvania.

EVENTS OF THE WEEK.—There is a long list of Shows to be worked through during the current week. To-day (Thursday, July 14th) the Wolverhampton Floral Fête and the Royal Caledonian Horticultural Society's Exhibition conclude. Rose Shows are being held at Harleston and Helensburgh. On Saturday, the 16th, the National Rose Society's Provincial Show will be held at Chester, and on the same day there will be an Exhibition of Roses at Charlton. On Monday, the 18th, Nuncaton Flower Show will be held. On Tuesday, the 19th, there will be a Rose Show at Moseley, Birmingham, also at Tibshelf; the former being continued on the following day. Eyc Flower Show will also be held on that date. On Wednesday, the 20th, Christleton Rose Show takes place, while on Thursday, the 21st, there are Shows at Trentham, Worksop, and Aylesbury.

— **THE WEATHER IN LONDON.**—Fine weather has prevailed on the whole during the past week, although there were a few light local showers on the 9th. The 10th was warm, although not sunny in the early part of the day. On the 12th the weather became dull and much colder, and rain fell steadily, though not heavily, for several hours. At the time of going to press the barometer is still depressed and the wind in the south and south-west. Showers are expected.

— **THE NEW CLASSIFICATION OF ROSE EXHIBITORS.**—It was a pleasure to find so many new exhibitors at the Crystal Palace on July 2nd. The Show was worthy of a Society calling itself National, for there were growers of all ranks in competition. Mr. Bateman, Mr. Grahame, and others who agitated so long for reform must have felt on good terms with themselves, and may fairly lay claim to the credit of having made the Society more popular than of yore. To go back to the old order of things now seems as impossible as it is undesirable. —NOVA.

— **INTERNATIONAL HORTICULTURAL EXHIBITION.**—Very complete arrangements have been made to protect the buildings from fire. Large high pressure mains run through the principal galleries, the theatre, lecture hall, &c., to which are connected twenty fire stations with standpost hydrants, hose, hand-pumps, and buckets. Small fire engines are also distributed through the buildings. These arrangements, as in previous exhibitions, have been carried out by Messrs. Shand, Mason and Co., who also exhibit steam and manual fire engines and other appliances. Superintendent Duck is in charge of an efficient fire brigade composed of men who have served in the Metropolitan Fire Brigade.

— **THE OXFORD CARNATION AND PICOTEE UNION.**—The annual Exhibition of the above will take place as usual in Mr. E. S. Dodwell's garden, in the Stanley Road, Oxford, on Tuesday, August 2nd. It was the desire of Mr. Dodwell to hold it on the 28th inst., so as not to clash with the Carnation Show at Earl's Court on August 1st and two following days; but as the midland growers have made a strong representation in favour of August 2nd in preference to the earlier date, Mr. Dodwell has given way. Generally there appears to be a promise of a fine head of bloom this season.

— **PINK ERNEST LADHAMS.**—This is a charming addition to an already large number of varieties, and being a seedling it is all the more valuable. The growth is exceptionally free, while the flowers, which are fringed, are produced in great profusion and contain much perfume. The colour is blush pink with a dark centre. At the late Rose Show held in Winchester a first class certificate was awarded by the Judges to this deserving novelty.—E. MOLYNEUX.

— **LOBELIA MAID OF MORAY.**—At the late Show held at Weybridge Mr. Puttock, nurseryman, Kingston-on-Thames, exhibited a charming Lobelia named Maid of Moray. The habit is dwarf—without being too much so—and compact. The centre or eye of the flower is pure white, with a clear light blue margin. It is without doubt a striking novelty, and should prove most useful in the flower garden. As a rule light blue Lobelias are somewhat straggling in growth, but the above is the reverse of this.—E. MOLYNEUX.

— **ROYAL COUNTIES AGRICULTURAL SOCIETY.**—The meeting of this Society at Redhill, for which great preparations have been made, is being held this week. It was opened on Tuesday and closes on Friday.

— **PINK, ROSE QUEEN.**—Messrs. Clibran & Son are sending out an attractive new Pink named Rose Queen that is likely to prove valuable either for the border or for forcing. It is dwarf, free, pleasing in colour, which is a rosy lilac shade, and fragrant.

— **COCCOLOBA PLATYCLADA.**—In a collection of table plants at Croydon Show Mr. C. Lane had a plant marked "Fern seedling," which proved to be Coccoleba platyclada. It had come up with a number of seedling Ferns. Its peculiar leafage is rather ornamental.

— **CYPERUS ALTERNIFOLIUS VARIEGATUS.**—I noticed a plant of this at Croydon Show that might almost be termed an albino, the majority of the leaves having only a faint edge of green. A long chapter could be written on the degrees of variation in variegated plants. —N.

— **PENTSTEMON PUBESCENS.**—This, one of the hardy Pentstemons is a free, attractive, and hardy species. The tube is purplish mauve and the lip pure white. It grows about 2 feet high, and is worth a place in hardy flower borders. Messrs. Cheal & Son have been showing it of late.

— **POLEMONIUM HIMALAICUM.**—I observed a Polemonium in a mixed collection of hardy flowers at a recent show under the name of himalaicum. It appeared to be identical with P. Richardsoni, and I can find no authority for the name. Perhaps some of your hardy flower-loving readers know something about it.—E. H. M.

— **MR. E. B. LINDSELL.**—Many rosarians were glad to see the leading amateur exhibitor at the Crystal Palace apparently well on the road to recovery from his severe illness. He does not look quite so bright and fresh as his Roses yet, but his hand has not lost any of its cunning with them, as many have found to their cost.

— **GARDENERS' ORPHAN FUND.**—A Rose fair was held on behalf of the Gardeners' Orphan Fund at the Croydon Horticultural Society's Exhibition on Wednesday week, and we are pleased to know that the sum of £8 6s. 6d. was realised from the sale of Roses for the charity. Mrs. Dart and Mrs. Gunner again kindly presided at the Rose fair.

— **LEICESTER AND MIDLAND CHRYSANTHEMUM SOCIETY.**—The Committee have decided to hold a small Show of early flowering Chrysanthemums and Dahlias on September 10th. As Dahlias are grown in quantity around Leicester it is anticipated that a very good display will be the result, and should it prove a success it will be repeated on a much larger scale another year.

— **THE WEATHER AT RIPLEY, YORKS, DURING JUNE.**—This was a dull, wet month, also cold, with the exception of four days, from 6th to 9th inclusive. On these days it was oppressively hot, and on the last mentioned date there was two cases of sunstroke in this district. The highest maximum temperature (shade) was 85° on the 9th, the lowest minimum temperature 30° on 18th. Total rainfall 3.87 inches, of which 1 inch fell during the night of the 28th. Rain fell upon twenty days. Mean reading of barometer 30.01. Mean maximum temperature 65.3°, mean minimum temperature 40.1°. Mean temperature 52.7°. Thunder was prevalent during the month. The total rainfall for the half year ending June 30th was 13.80 inches, which fell upon 112 days.—J. TUNNINGTON, *Ripley Castle Gardens*.

— **NATIONAL CHRYSANTHEMUM SOCIETY'S ANNUAL PICNIC.**—The annual picnic and outing will, by the kind permission of the Right Hon. The Lord De L'Isle, take the form of a visit to Penshurst Castle, Kent, which is rich in interesting historical associations. The gardens and grounds will be open to inspection, together with the state apartments. The Castle and grounds are two miles from Penshurst, along a pleasant and shady road. About half-way is Redleaf, the residence of F. Ernest Hills, Esq., a place renowned for its beauty and high culture, and permission has been given by Mr. Hills for the party to walk through the grounds of Redleaf, leaving them at a point close to the Castle Park, through which the party can reach the hotel. The date fixed for the picnic is Friday, July 22nd, leaving Charing Cross at 9.28 A.M. Particulars may be had from Mr. R. Dean, Ealing, W.

— **SHEFFIELD SHOWS.**—The second summer Show of the Sheffield, Hallamshire, and West Riding United Chrysanthemum Society will be held at the Museum, Orchard Street, Sheffield, on August 29th and 30th. There are classes both for professionals and amateurs. The Chrysanthemum Show is to be held in the Corn Exchange on November 11th and 12th.

— **GARDENING APPOINTMENTS.**—Mr. H. Godfrey, for the past thirty years gardener to the late H. C. Rothery, Esq., Ribsden Hill, Windlesham, Bagshot, Surrey, has been appointed gardener to — Fisher, Esq., The Grove, Streatham. Mr. Chas. Prior has succeeded Mr. Jas. Merry as head gardener to G. M. Medely, Esq., Winsford Tower, Beaworthy, Devon.

— **ROYAL BOTANIC SOCIETY'S EVENING FETE.**—Cold and stormy weather sadly militated against the success of this fête, which was held on the evening of July 6th. The grounds had been beautifully illuminated, but a great number of the lights were blown out. There was a very large attendance, and, with good music and attractive floral decorations, there was no lack of pleasant features.

— **HORTICULTURE IN PARLIAMENT.**—The new Members of Parliament comprise several who take a keen interest in horticulture, and are capable of forming practical opinions on any questions that may arise respecting it in the House of Commons. To avoid introducing a partisan element two are mentioned representing opposite sides, Sir Jas. Whitehead, Bart., and Mr. W. H. Myers of Swanmore. Both are in all respects worthy additions to the great assembly.

— **THE WEATHER LAST MONTH.**—June was warm and bright up to the 10th, but changeable after, with some very cold nights, and a sharp frost on the morning of the 15th, which cut Potatoes, Kidney Beans, Heliotrope, Dahlias, and other tender plants rather severely. On the night of the 30th also the minimum temperature was very low—viz., 37°. Barometer highest, 30.47 at 9 A.M. on the 8th; lowest, 29.60 at 9 A.M. on the 23rd. Total rainfall, 2.25 inches, which fell on sixteen days; the greatest daily fall being 0.81 on the 10th. Highest shade temperature, 82° on the 10th; lowest, 32° on the 15th; lowest on grass, 28° on the 15th. Mean of daily maximum readings, 67.30°; mean of daily minimum, 45.26°; mean temperature of the month, 56.28°. The wind was in a westerly direction twenty-one days. We had thirteen bright days, one of which was clear. The garden spring ran 20 gallons per minute on the 30th.—W. H. DIVERS, *Ketton Hall Gardens, Stamford.*

— **SUMMARY OF METEOROLOGICAL OBSERVATIONS AT HODSOCK PRIORY, WORKSOP, NOTTS, for June.**—Mean temperature of month, 55.1°. Maximum on the 9th, 80.2°; minimum on 15th, 34.2°. Maximum in the sun on the 26th, 130.1°; minimum on the grass on the 15th, 28°. Mean temperature of the air at 9 A.M., 57.6°. Mean temperature of soil 1 foot deep, 56.8°. Nights below 32°—in shade, none; on grass, six. Total duration of sunshine in month, 186 hours, or 37 per cent. of possible duration. Total rainfall, 3.26 inches. Maximum fall in twenty-four hours on the 28th, 1.32 inch. Rain fell on eighteen days. Average velocity of wind, 7.5 miles per hour. Velocity exceeded 400 miles on one day and fell short of 100 miles on nine days. Approximate averages for June:—Mean temperature, 57.4°. Sunshine, 157 hours. Rainfall, 2.01 inches. A cool and showery but rather sunny month. The rainfall would have been normal but for the heavy fall on the night of the 28th, accompanied by a sharp thunderstorm. Everything has grown fast and the country looks very well.—J. MALLENDER.

— **PROGRESS IN BEGONIAS.**—I observe Mr. Gumbleton's remarks on page 9 respecting my article on Progress in Begonias. He is in error in charging me with inaccuracy in my reference to Laing's Picotee. Read, as it ought to, in relation to the context, the remark that it stood alone of its class is perfectly correct. I was then (to quote from my article) making "direct reference to the magnificent collection" at Forest Hill, and there Laing's Picotee reigns unique and supreme. I by no means stated that it was the only one in existence, as he implies, for I knew from a statement by Mr. Laing, junior, that it was not. Nor is he more correct in stating that I led my readers to suppose that all the varieties mentioned were raised at Stanstead Park Nursery by Mr. Laing. On the contrary, I was most careful to guard against doing so. Messrs. Laing & Son have done too much to require crediting with other people's work. I regret very much that no opportunity has yet presented itself of responding to the kind invitation, more than once repeated, to visit Belgrove. Judging from what I have heard and read of its treasures, no one could visit Mr. Gumbleton's garden without benefit.—W. P. W.

— **CALLA ELLIOTTIANA.**—I merely inferred that Calla Elliottiana was a hybrid between C. hastata and C. aethiopica from its spotted foliage being the same as that of the first-named species and the shape of the flower spathe about midway between that of both sorts. When seedlings bloom if they come true to name the question should be settled one way or the other. Could not "W. W." ask Mr. Elliot's gardener whence he got it, and let us know his answer?—BOSCOBEL.

— **THE RIVAL SOCIETIES AT BRIGHTON.**—We are informed that the struggle between the two horticultural societies at Brighton has come to an end, the fixtures of the Brighton and Sussex Horticultural and Floricultural Association, of which Mr. E. Carpenter was Secretary, having all been cancelled. The Show of the Brighton and Sussex New Horticultural and Mutual Improvement Society will be held as arranged on August 30th and 31st, and the Brighton and Hove Chrysanthemum Show on November 1st and 2nd.

— **CERTIFICATES AT THE INTERNATIONAL HORTICULTURAL EXHIBITION.**—At the Show held on July 5th and 6th first-class certificates were granted to Messrs. F. Sander & Co., St. Albans, for Cattleya Schofieldiana variety; C. Amesiae, C. Leopoldi var. Lauchiana, and Mormodes pardinum; Odontoglossum vexillarium vars. International, W. Lauche, leucoglossum, H. E. Milner, Duke of Sutherland, Harry Turner, John Jaques, and Duchess of Sutherland; Vanda Hookeriana, and V. Sanderiana; to Messrs. Kelway & Son, Langport, for Delphiniums James Kelway and Uta; to Messrs. B. S. Williams and Son, Upper Holloway, for Ailamanda Williamsi and Nepenthes Burkei; to Mr. W. Allan, gardener to Lord Suffield, Gunton Park, Norwich, for Strawberry Gun on Park; to Messrs. John Laing & Sons, Forest Hill, for Tuberous Begonias Glory of Stanstead, Lady Foley, Jeanne d'Arc, Laing's Golden Dwarf, W. Clifford, Mrs. Blundell Maple, and foliage Begonia Valentine Denize; T. S. Ware, Tottenham, for Begonias Henshaw Russell, Princess May, Pico'ee, and Bexley Gem, also Lilium dalmaticum, L. maritimum, and Achillea The Pearl.

— **AN EX-GARDENER MEMBER OF PARLIAMENT.**—The newly elected member for North Lambeth, Mr. Alderman Coldwells, J.P., is an ex-gardener, hailing from Stoke Newington. When a lad he was a member of the Gardeners' Society there, and attended meetings and took part in the essays read and discussions there. Mr. Coldwells has served as head gardener in Essex, Middlesex, and Surrey, his last place in that capacity being gardener to the late Colonel Morse Robinson, Birdhurst, Croydon. He has been an exhibitor at and a judge at flower shows, and subsequently became manager of the Croydon Irrigation Farm under the Croydon Corporation. He was afterwards elected a member of the Croydon Local Board, and one of the first members of the Croydon School Board. Since being made a corporate town he was elected a Town Councillor, and subsequently an Alderman, as a reward for the exertions he displayed in trying to bring about the incorporation. He was soon after made a J.P. He is now managing director of a company owning a large tract of reclaimed land at Bembridge, Isle of Wight, with a railway and steamboats running in connection with the place. A portrait of Mr. Alderman Coldwells, M.P., appeared in the *Journal* on August 16th, 1888.

— **MINIATURE VIOLAS.**—Mr. George Steel sends a box of Viola blooms which may be said to form a new section. We understand that they are the result of a series of crosses by Mr. Steel and Dr. Stewart of Chirnside, which have been in progress for a considerable time past. The flowers are extremely attractive; they are much smaller than the ordinary type, and the habit of the plants is very dwarf and compact. There are probably very few persons who will not concede their right to be classed as a new and distinct type, while the flowers are so bright, fragrant, and charming in every way that they are certain to become very popular. Mr. Steel thinks that "they hold a position to the ordinary type similar to that between the Pompon and Show Dahlias." The suggestion is a happy one. The varieties received are Violetta (Stuart), white, yellow centre, very sweet; Mrs. Joseph Oliver (Steel), nearly pure white, fragrant, very dwarf; Ophir (Stuart), yellow, highly perfumed; Jeannie Turnbull (Steel), lavender, very beautiful and sweet; Mrs. George Finlay (Steel) pale yellow, upper petals shaded white, fragrant; Mrs. Stephens (Steel), white, edged with lilac, yellow centre, sweet; White Lady (Stuart), creamy white, sweet; Beauty of Heatherlaw (Steel), rich yellow; and Maggie Steel (Steel), primrose, very fragrant. We hope to see and hear more of these. Mr. Steel also sends two new varieties of the ordinary type:—Sylvia (Stuart), creamy white, good form; and Border Maid (Steel) yellow, edged violet, which might be termed a yellow Skylark.

— **PEACH YELLOWS.**—In the Report of Mr. B. T. Galloway, Chief of the Division of Vegetable Pathology to the United States Department of Agriculture, we find among much other interesting matter the following:—"Since my last report a bulletin has been published on Peach yellows. There are given in this bulletin the results obtained up to date by means of bud inoculations and excisions. The experiments were made with the greatest care; they cover a period of years, and were repeated several times, so that the final results might be depended upon. The conclusions from the work are as follows: (1) The disease is contagious, and may be conveyed by healthy-looking buds when these are taken from partly diseased trees. (2) Only a small amount of infectious material is necessary to produce the disease, provided it is in the form of living cells which can be induced to unite with the actively growing tissues of the inoculated tree. In some cases the disease has a period of incubation extending over two years, and the probabilities are that additional experiments will demonstrate in some cases a still longer period. Many hundred experiments have proved these conclusions to be correct. (3) The life of inoculated trees varies from one and one-half to four and one-half years. In orchards the death of the entire tree occurs in from one to six years. In a majority of cases the disease is chronic, and some part of the tree may live for a long time."

— **AN UNUSUAL OCCURRENCE.**—Just before midnight last Saturday Mr. Cannell's time-bell rang out vehemently. All those who were up were soon followed by many who had retired to rest to ascertain what was the matter; some concluding that part of the nursery was on fire. On entering the gates Mr. Cannell's Cacti-grower called out, "Wait a while, and I will show it to you." They thought he had been hoaxing them, for they were not aware that Mr. Cannell had given orders that the next time the Night-blooming Cactus, *Cereus nycticalus*, was in flower all the employes should see it, because on a former occasion the opportunity was lost, and only a drooping and fast-fading flower was to be seen on the following morning. Mr. Gough, after attentively watching for two hours, observed it beginning to open its petals, and when nearly at its best he concluded the best and quickest way to give notice of the event and draw attention, so that as many as possible could enjoy its beauty, was to tug away at the dinner-bell, and of course he soon had a crowd around him to view this wonderful nocturnal disturber. There was no mistaking its beauty—lovely pearly white petals with long-pointed outer florets tinted brown; this, together with the great number of stamens in the centre of the flower, gave it a striking appearance. After thoroughly inspecting this wonderful flower the crowd hurried homewards to bed, highly pleased with their floral treat. The variety, together with several others, may be grown in the stove or warm greenhouse trained against the walls, will not take up much room, and does not require much attention.

— **MISS JOLIFFE CARNATION.**—Where Carnations are appreciated the improved form of this variety should certainly be grown in quantity for flowering under glass during the spring months of the year, in fact it will continue to flower until Carnations are plentiful outside. If sufficient stock has not been obtained, and this is often the case where a few plants have been obtained to commence with, plants that have practically done flowering may be utilised for that purpose. They may be turned out of their pots and the old balls laid amongst light soil, so that the growths lie close upon the ground. The plants will soon commence fresh root activity providing the soil is kept moist. The grass can be layered in the ordinary way, and when the young plants are well rooted they should be potted singly into 3-inch pots. These can remain outside until the approach of frost, when they should be removed to cold frames for the winter. The stock in spring should be divided into two parts, one for growing in pots, and the other for planting out for stock again. The object is to be independent of spring-striking in heat. The remaining portion of the batch should be placed into 5-inch pots, and stood outside on beds of ashes. Once they begin to grow flower stems will show themselves, and if removed bushy plants for winter and spring flowering will be the result. The strongest of the plants may be placed into 7-inch pots, and from these a large quantity of flowers will be produced. A good compost for these plants is fibry loam three parts to one of sand, leaf soil, and manure in a decomposed condition. The soil at the last potting should be pressed firmly into the pots, so that sturdy growth will be made. Strong stimulants must be avoided, for the Carnation will not do well if these are applied. The syringe should be used to keep the plants free from red spider, and aphides must not be allowed to become established upon them.—
A GROWER.

— **PEAS AT CHISWICK.**—The first inspection of the Pea trials at Chiswick by the Fruit Committee of the Royal Horticultural Society took place on Thursday afternoon last week. There was a good attendance of members, including M. Henry de Vilmorin, who was heartily welcomed. The Peas, though generally very fair, are not so robust generally as last year, owing to the lightness and dryness of the soil; earlier in the summer some, however, were very good. The Committee were very early in the inspection attracted to Duke of Albany, which was podding finely and freely, and found in that excellent and popular variety a good standard on which to proceed in selecting the best varieties. It was difficult to find any Pea that excelled Duke of Albany in general excellence. In addition to that variety, Essential, medium tall Pea, good cropper, carrying shortish stubby green pods, peas of good flavour; Duke of Rutland, 5 feet high, capital cropper, rather straight pods, sweetish peas and fair flavour; Boston Hero, a tall later form of Duke of Albany; Consummate, dwarf, fine green, partly curved pod, a capital midseason Pea; Renown, a sturdy, fine cropping Marrow; The Echo, a robust growing dwarf Pea, fine pod and free cropper; Alderman, a 6-foot Pea, a great cropper, fine straight pod, peas sweet and of excellent quality; and Duke of York, a new and distinctly dwarf form of Duke of Albany, height about 3½ feet, and reputed to be several days earlier in podding, were good. These all received the full number of marks equivalent to the granting of certificates of merit. Many of the later varieties, whilst very promising, yet wanted to be seen again later. So good now are our best Peas that the Committee find it very hard indeed to detect special qualities in new ones that merit commendation.

— **BEDDING BEGONIAS.**—There are some novelties in this class of plants being tested at Chiswick this season the which should attract attention. One large bed is filled with those hybrid forms that have fibrous roots and are freely propagated by cuttings, of which Princess Beatrice is now a well-known type. These come from Messrs. Sutton & Sons, Reading. They seem, both in colour of flowers and in habit, to present bedding plant elements which should make them eventually very popular. Then close by, in two or three smaller beds, are varieties sent to the gardens by Messrs. Vilmorin & Co. of Paris. These seem to be the dwarfiest and most profuse blooming of all the tuberous-rooted forms, and belong to a section known in France as *multiflora erecta*. Some of the varieties, notably pink, scarlet, carmine, and yellow doubles, are now blooming profusely at from 6 to 8 inches high. The flowers, though below what we should call medium size, are very double and of good form. They are, if not absolutely erect, at least much more so than are those of the ordinary English varieties, and seem to present the most effective miniature bedding Begonias we have seen. Some are very early, others later, but M. de Vilmorin mentioned when at Chiswick the other day that these early forms bloomed continuously until cut down by frost. There are single dwarf erect varieties also in other beds, but these are evidently more robust and later in blooming. So evident is it that the Begonia is in for a long period of popularity as a bedding plant, that we cordially welcome any varieties which will serve to enhance that popularity and at the same time give such variation in habit and effect as shall draw general attention to what is one of the most beautiful of garden flowers. The new varieties at Chiswick will, no doubt, secure much notice during the present summer.—A. D.

CARNATIONS ATTACKED BY HYLEMYIA GRUBS.

IN your report of the meeting of the Royal Horticultural Society of June 21st you alluded to Mr. McLachlan's observations in regard to this insect at the Scientific Committee, and as the subject is one of considerable importance to the cultivators of the Carnation and Picotee I again draw attention to what you then wrote. "The grubs lived beneath the rosette of leaves forming the crown of the plant, and also bored into the stem below the crown. The perfect female insect having been now obtained for the first time it proves to be *Hylemyia nigrescens*, Rnd., allied to *H. Cardui*, which feeds in the flower heads of Thistles. He (Mr. McLachlan) suggests hand-picking as soon as symptoms of flagging is seen in the Carnation."

The ravages of this insect came under my notice last year, and in collections about Birmingham the grub is at work again this year, but as our growers keep a sharp look out for it no great amount of damage is done. To cultivators unaware of its existence much annoyance and loss may be avoided by at once closely examining their plants.

The grub is, no doubt, the result of an egg inserted into the stem or grass of the plant, but the earliest stage of the operations of the grub is to be seen about the early part of June, and any symptoms of decay in the main or lateral stems of the plant should be examined, when a very small yellow grub will be found, changing to a nut brown colour as it gets older, eating out the heart of the stem, but it cannot be seen until

the attacked part is cut away and examined. It also attacks the young foliage and eats its way into the "grass" (young leafshoots at the base of the plants), and any indication of curling or decay should lead to immediate examination. The grub ultimately turns to a small brown chrysalis about a quarter of an inch long.

Mr. Herbert, a well known successful cultivator, and manager of Messrs. Thomson's nurseries at Sparkhill, has tried various remedies in the shape of insecticides, but all are of no avail. The only remedy is frequently and closely searching, examining, and hand-picking. I notice that in the last number of the "American Florist" there is a paragraph stating that much harm has been done to the Carnation and Picotee in England by this grub. I have not heard of any great amount of mischief yet, and if there has been it must have arisen from a want of knowing how to deal with the pest.—W. D.

HORTICULTURAL SHOWS

WARE.—JULY 7TH.

THE first summer Show held in connection with the Horticultural Mutual Improvement Society was held on the 7th inst. in the grounds of R. Walters, Esq., The Priory, and was considered in every way to be a thorough success. Classes were provided for amateurs and cottagers, also open classes for general competition.

Plants were a good feature. In the class for groups arranged for effect Mr. G. Fulford, gardener to R. Walters, Esq., Ware, was clearly ahead with a group especially rich in Dracaenas, Caladiums, Anthuriums, and Palms, Gloxinias forming the chief of the flowering plants. Mr. E. Collins, gardener to S. Gray, Esq., Ware, came second with a lot of well grown plants. The Begonias, Marantas, Zonal Pelargoniums, and Coleuses were very good, but the arrangement was a trifle too formal. For six stove and greenhouse plants Mr. F. Gull, gardener to J. W. French, Esq., Amwell, took leading honours, showing a very handsome specimen of *Crinum capense alba*. Four Ferns, distinct, found Mr. R. Dover, gardener to R. Barclay, Esq., Hoddesden, to the fore, closely pressed by Mr. F. Gull. Tuberous Begonias were well shown, and the competition keen, Messrs. Gull, Fulford, and Twicken, gardener to E. Chaplin, Esq., Amwell, taking the prizes in the order named. For a flowering specimen plant Mr. R. Dover secured first honours; second Mr. Gull. With a specimen foliage plant Mr. W. Pavey, gardener to H. Taylor, Esq., was first, and Mr. Dover second.

The cut flower section was quite a feature, especially the stove and greenhouse flowers. For twenty-four Roses in not less than twelve varieties, Mr. G. Fulford was first with very fresh blooms, though a trifle small, which seemed the case in the whole of the classes; second, Mr. R. Dover; third, Mr. C. Cox, gardener to Colonel Trotter, Brickendon Grange. In the twelve the competition was better, Mr. G. Fulford again leading, followed by Messrs. Dover and C. Rogers, gardener to J. Benningfield, Esq., St. Margarets. Teas were very even and fresh, though, like the hybrids, rather small. Mr. J. Turk was first, followed by Messrs. Fulford and Pavey in the order named. In the class for twelve bunches of stove or greenhouse flowers, distinct, Mr. R. Dover, who was first, exhibited *Epidendrum vitellinum*, *Vanda tricolor*, *Malmaison Carnations*, *Eucharis*, and *Thunia Marshalli*; second, Mr. G. Fulford; third, Mr. J. Turk. In the hardy section, Mr. J. Turk was easily ahead with a choice selection, followed by Messrs. Twicken and C. Rogers. With a hand bouquet, Mr. Phillips, gardener to Rev. E. E. W. Kirkby, was the only one to enter.

Fruit was not largely shown, but the quality was excellent. Black Grapes found Mr. Gull leading; white, ditto, Mr. R. Dover first; second, Mr. F. Gull. For a collection of fruit Mr. G. Fulford was first with fine *Madresfield Court* and *Buckland Sweetwater* Grapes and *Nectarines*, good; Messrs. Pavey & Collins taking the other prizes. Melons were rather small, but appeared to be of good quality. First, Mr. Dover; second, Mr. J. Turk. Strawberries were excellent, the prizes being taken by Messrs. Pavey, Bray, and Collins. Competition in the vegetable classes was not so keen as expected. Amateurs' classes were not well filled, though the quality of their exhibits was satisfactory. The cottagers turned out in true Hertfordshire fashion with quality as well as quantity.

Trade exhibits materially assisted the Exhibition. Messrs. Paul and Son, Cheshunt, had a good collection of Roses. Francis Bros. of Hertford also exhibited a very fine lot of Roses; J. Chapman, Nurseries, Ware, staged a choice collection of stove and greenhouse plants, which were much admired. Palms and decorative plants were sent by Mr. Alexander, gardener to E. S. Hanbury, Esq., Polcs, Ware. Mr. D. Bray staged some grand Raspberries called *Hornet*; the sprays were laden with magnificent fruits. The Exhibition was well attended, and we hope will result in a financial success.

CHERTSEY, WALTON, WEYBRIDGE, AND DISTRICT.—JULY 7TH.

THE Exhibition this year was held at The Hollies, Weybridge, a place in every way thoroughly suited for the purpose. The Exhibition was conceded to be the best yet held by this Society, which has been in existence twenty-six years. The exhibits all round showed superior skill; indeed, there was nothing in the whole Exhibition which could be classed as moderate. The arrangements were all that could be desired, and reflected credit upon the Secretary, Mr. T. J. Rawlings, who has served the Society unremittingly since its foundation.

Plants occupied the major portion of the Show, and were arranged in one large tent, except the groups for effect, which had a tent to

themselves. The most important class was that for eight miscellaneous plants, not less than four to be in flower. Mr. J. Reeves, gardener to General Annesley, Templemead, Oatlands Park, was an easy first, staging capital specimens of *Statice profusa*, *Stephanotis floribunda*, *Bougainvillea glabra*, and *Cycas revoluta*. Mr. J. W. Reed, gardener to E. Pettit, Esq., Oatlands Park, was a good second. The last-named took premier honours in the class for six stove or greenhouse specimens, and in another class for four Mr. G. J. Cook, gardener to J. S. Sassoon, Esq., Walton, was the most successful; Mr. J. Reeves being second, both staging meritorious exhibits. Mr. J. W. Reed won first honours for six foliage plants; Mr. J. Reeves being accorded a similar honour for four specimens, also for one specimen stove or greenhouse flowering plant with *Bougainvillea glabra* in good condition. Ferns, both exotic and hardy kinds, were staged in capital condition. In the former class Mr. G. J. Cook was the most successful, followed by Mr. J. W. Reed. In the latter section Mr. A. Millican, gardener to H. Cobbett, Esq., Ongar Hill House, Addlestone, won first place, both staging well.

Gloxinias were exceptionally well shown in the classes for six and four plants by Mr. W. Stedman, gardener to Miss Verity, Moorcroft, Weybridge, and by Mr. W. C. Pagram, gardener to A. F. Hobhouse, Esq., Weybridge, who took the prizes in the order named. Tuberous Begonias added much to the beauty of the Exhibition, so numerous were they staged and so good in quality. For six Mr. Stedman was well ahead, Mr. Pagram coming second, while Mr. G. Carpenter, gardener to Major Collis Brown, Broad Oaks, Byfleet, occupied the post of honour in the class for four plants. Fuchsias were remarkably good, the plants being loosely trained and freely flowered. Messrs. J. Peed, J. Reeves, and J. Thorne (gardener to A. E. Flood, Esq., The Bush, Walton) were the prizewinners. Caladiums, Pelargoniums and *Achimenes* were well represented in their various classes by Messrs. Reeves and C. Gardner, gardener to R. H. Turner, Esq., Walton.

As before stated groups of miscellaneous plants arranged for effect were a great feature of the Show. With those 14 feet by 7 feet there were four competitors. Mr. G. J. Cook was a somewhat easy first, the plants being well chosen and lightly disposed. Mr. J. Reeves followed, some of his plants, Caladiums especially, being a little crowded. Mr. J. W. Reed was third. In the smaller class, 10 feet by 5 feet, Mr. Carpenter occupied the leading place, Canterbury Bells at the back and light blue *Lobelias* at the margin being arranged with telling effect. Mr. A. Millican was a close second; Mr. F. Hopkins, gardener to Miss Widderspoon, Walton-on-Thames, third.

Cut flowers were the centre of attraction in one tent. For the best centre stand, flowers and fruit, for dinner table decoration, Mr. A. Millican was decidedly first with an effective arrangement, and Mr. J. Reeves second. In the class for the best floral ornament for the drawing-room (ladies only) Mrs. Osman, Ottershaw Park, was an easy first, and Mrs. Reeves second. Mr. F. Hopkins had the best bouquet. Roses were staged in large numbers and of good quality. Mr. Edward Rutter, Shepperton, succeeded in winning the premier award for twenty-four varieties, single trusses, Mr. W. Taylor, Osborn Nursery, Hampton, Middlesex, being second. Mr. G. Carpenter won with twelve varieties, single trusses, staging well. Limited space, however, forbids giving the names of the varieties. Herbaceous flowers made a large display. The principal prizes were carried off by Messrs. M. C. Pagram and H. Jacques, gardener to Miss Penny, The Alnmers, Chertsey.

Fruit, although not staged in great quantities, was good in quality. The best collection of six varieties came from Mr. Osman, gardener to L. J. Baker, Esq., Ottershaw Park, Black Hamburgh and Muscat of Alexandria Grapes, Al Melon, and Grosse Mignonne Peaches being in good condition. Mr. Osman took leading honours also for two bunches of black Grapes with well finished examples of Black Hamburgh, and for two bunches of white Grapes, staging *Buckland Sweetwater*. Mr. J. Reeves followed in both classes. Mr. Jacques had the best scarlet Melon, a splendid specimen of *Empress*, also the best green-flesh. Mr. J. Swann, gardener to G. Murray Smith, Esq., Brackley Lodge, Weybridge, staged the best Peaches, *Noblesse*; Mr. Carpenter the finest *Nectarines*, Lord Napier, and Strawberries Sir J. Paxton.

Classes were freely provided for vegetables, the competition in most cases being keen and the exhibits commendable. For a collection of eight varieties Mr. J. W. Reed was an easy first, and Mr. F. Hopkins second.

Messrs. Peed & Son had a fine collection of flowering and foliage plants "not for competition." Mr. G. Jackman had large boxes of Roses, containing the leading varieties in capital condition.

LEE, BLACKHEATH, AND LEWISHAM.

JULY 7TH AND 8TH.

THE twenty-fifth annual Exhibition of the Lee, Blackheath, and Lewisham Horticultural Society was held in the grounds of The Cedars, Lee, on July 7th and 8th, and fully maintained the reputation it has hitherto had. The exhibits, as a whole, were quite up to their usual standard, and being arranged in four spacious marquees made a bright display. Most of the classes were well filled, and in some instances the competition was quite keen. Greenhouse and stove plants were most conspicuous, although hardy flowers and fruit and vegetables were fairly numerous, while the cottagers' and children's exhibits excited much interest. The names of the principal prizewinners in the gardeners' classes are embodied in the following notes.

Specimen plants were excellent. For six foliage plants Mr. J. Mullins, gardener to W. Strange, Esq., Lee Terrace, was first, and Mr.

J. Lambert, gardener to W. H. Sezelycke, Esq., Herne Hill, second. These were the only competitors in this class. Mr. Mullins also secured first honours for four stove or greenhouse plants in flower. Mr. C. Nunn, gardener to J. Soames, Esq., Maze Hill, Greenwich, was a close second; and Mr. W. Jeffery, gardener to Mrs. Crundwell, The Moat, Eltham, third. Mr. Nunn showed the best single specimen in flower, *Stephanotis floribunda*, and Mr. Mullins the best plant out of flower, a Palm. Messrs. Lambert, Rhoden, and Kelwar were also prizewinners in these classes. Caladiums were also good. Mr. W. Payne, gardener to W. C. Dabel, Esq., Eastcombe Villa, Blackheath, was first for four plants, followed by Mr. F. Newnham, gardener to J. Ashton, Esq., Bryan House, Blackheath, and Mr. W. Jeffery, Eltham. The last named exhibitor was first, however, with twelve stove or greenhouse plants, and Mr. C. Nunn was second. The third competitor was disqualified. Mr. Nunn was first for six Caladiums, showing grand specimens, and Mr. F. Fox, gardener to Mrs. Penn, The Cedars, Lee, was second, the third prize going to Mr. T. Aley, gardener to R. Kersey, Esq., High Road, Lee.

Fuchsias were well shown by Mr. Jeffery and Mr. C. Saville, gardener to J. Murray Wilson, Esq., Lee Terrace, both of whom had pyramids. Mr. Jeffery was also first for four foliage plants, showing *Croton Queen Victoria*, *Latania borbonica*, *Kentia Belmoreana*, and *Alocasia macrorrhiza variegata*. Mr. J. Cooke, gardener to W. C. C. Parke, Esq., Hither Green, Lewisham, and Mr. Rhoden, Blackheath Park, were second and third. Mr. Cook was first for standard Fuchsias. Exotic Ferns were also good. Mr. Rhoden was first for six and Mr. J. Mullins second. Mr. J. Lambert had the best four Ferns, which included a fine *Adiantum farleyense*. The second prize fell to Mr. W. Jeffery; and the third to Mr. J. W. Pearce, gardener to A. W. Ballance, Esq., Blackheath Park. For smaller Ferns, Mr. J. Mullins was first with six specimens; and Mr. J. Rhoden second; the third prize going to Mr. C. Nunn.

Mr. Lambert had the best six *Dracenas*, the second prize going to Mr. W. Jeffery. Mr. Mullins was first with four *Dracenas*, and Mr. Fox second, Mr. Aley being third. Four plants of *Gloxinias* were best shown by Mr. C. Nunn and Mr. W. Payne. Orchids were best shown by Mr. Herd, gardener to Mrs. Bayley, Lee Road; Mr. Lambert; and Mr. Hood, gardener to M. N. Buttenshaw, Esq., Blackheath Park. Mr. G. T. Shrubb, gardener to Mr. South, Blackheath, was first with ornamental *Begonias*; Mr. Saville and Mr. Fox second and third respectively. Mr. Mullins was first for six Palms, and Mr. F. Fox second. Six hardy Ferns brought three competitors, the first prize falling to Mr. C. Saville. Mr. J. Mullins and Mr. Fox were second and third respectively. Mr. Lambert secured the first prize for four *Lycopodiums*, and Mr. Jeffery and Mr. F. Fox were second and third. The first-prize collection included a fine specimen of *S. laevigata*. Mr. Jeffery was also first for six double and single *Pelargoniums*, and Mr. Mullins took first honours for four *Zonals*, and likewise for four Show *Pelargoniums*; the second prize in the latter class going to Mr. J. Rhoden. Mr. C. Saville was first for six *Coleuses*, which were also well shown by Mr. J. Pearce, gardener to J. Wainwright, Esq., Belmont Hill. Mr. Aley was first for three table plants, and Mr. F. Fox second. The best single table plant (*Cocos Weddelliana*) was shown by Mr. Lambert, and the next best by Mr. J. Cooke. Hardy flowers were shown by Messrs. J. T. Shrubb, J. Mullins, and A. Byrns, Esq., Fooks Cray, Kent.

Roses were not very numerous but the blooms staged were very fresh and bright. C. E. Shea, Esq., Fooks Cray, Kent, was first for twenty-four blooms, La France and Horace Vernet being particularly good in this stand. Mr. J. Bateman, Highgate, was second in this class and third for six blooms. R. L. Knight, Esq., Sittingbourne, was placed third for twenty-four blooms and first for twelve Teas or Noisettes. Mr. Fox staged the best nine Roses, Mr. J. Pearce and Mr. J. Rhoden being second and third. The first and second prizes for six Roses were awarded to A. Bryans, Esq., and Mr. P. A. Bartlett, gardener to Mrs. Brown, Eltham. Mr. Shea was also first with twelve and six Hybrid Perpetuals. Mr. J. Bateman was awarded third for twelve blooms, the other prizewinners in various classes including those already mentioned.

Special prizes for pot plants and cut flowers were also numerous. Mr. Jeffery was first for a table of plants tastefully arranged, the second and third prize going to Mr. F. Fox and Mr. Mullins. Mr. Helmer, gardener to Miss Hookey, Lee Terrace, was first for four single and double *Begonias*. Mr. Rhoden secured first honours for six *Begonias* in both sections. Mr. Mullins was first for a small group of plants, and Mr. J. Pearce second, the third prize going to Mr. J. Rhoden. The best twenty-four miscellaneous plants were shown by Mr. Jeffery, Mr. Rhoden and Mr. Mullins being second and third. Messrs. J. Peed and Son were awarded the prize for a group of miscellaneous plants, there being no other exhibitor. Various "not for competition" groups were staged, which included splendid collections of Tuberous *Begonias* and *Pelargoniums* from Mr. H. J. Jones, Ryecroft Nursery, Lewisham, greenhouse plants, Roses, and hardy flowers from Messrs. J. Laing and Sons, and Cacti from Messrs. Carter & Co.

Fruit was not very plentiful, but fairly well shown. Mr. T. A. Kester, gardener to W. G. Dawson, Esq., Plumstead Common, was first for a collection, and Mr. J. Neighbour, Bickley Park, second, Mr. W. Jeffery being third. Mr. Rhoden was first for three bunches of black Grapes, and Mr. G. Abbey, gardener to Colonel North, Avery Hill, Eltham, first for a single black bunch, showing Black Hamburgh in good condition. Mr. Abbey was also first for a bunch of white Grapes with Buckland Sweetwater. Messrs. J. Neighbour, J. Rhoden, and R.

Goddard also showed Grapes well. Mr. Neighbour was first for a dish of Strawberries, and Mr. Rhoden for Peaches.

Vegetables were most numerous in the cottagers' classes. The best collection in the gardeners' section was shown by Mr. F. Fox. This stand included some well grown Carrots, Peas, Mushrooms, Onions, and Beet. Mr. Jeffery and Mr. Neighbour were second and third respectively. Mr. C. Nunn secured the first prize offered by Messrs. C. Sharpe and Co., Sleaford, for a collection of vegetables, the same exhibitor also being first for six pots of Tomatoes. Mr. Jeffery was second in the latter class, and first with a collection of vegetables for Messrs. Sutton's prizes.

BULBOPHYLLUM RETICULATUM.

THE extremely rare *Bulbophyllum reticulatum* is now flowering, among other choice things, in Mr. William Bull's Orchid Exhibition. The species is one of the most attractive in this curious and remarkable genus.

CYPRIPEDIUM SOUTHGATENSE.

AMONGST the Orchids which received recognition from the Royal Horticultural Society at the Temple Show was a hybrid *Cypripedium* exhibited by Messrs. W. L. Lewis & Co. under the name of southgatense. It is represented by fig. 6 (see page 39). *C. bellatulum*, so largely utilised by hybridists, is one of its parents, the other being *C. Harrisianum*, the latter being the pollen parent. The hybrid is quite distinct from either of them, alike in form, marking, and general expression. The greatest resemblance to *C. Harrisianum* is found in the lip, the form of which follows the pollen parent rather closely; in colour it is a near approach to rose. In the petals and dorsal sepal, however, there is a wide departure, these more resembling *C. bellatulum*. They are deeply spotted and lined with purple. The hybrid is distinct, and a first-class certificate was awarded.

AERIDES FIELDINGI.

THE "Fox Brush" Orchid, as *A. Fieldingi* is generally known, is a plant which with fair treatment may be relied upon to produce its crowded flower spikes regularly every June and July. The leaves are about 9 inches long, 1 inch broad, and fleshy; the racemes vary from 1 foot to 2 feet in length, and are closely set with flowers about 1 inch across, purple and white in colour. *Aerides Fieldingi* was introduced from the north-east of India in 1850 by Messrs. Veitch. The "Fox Brush" is not hard to cultivate, and grows and flowers well if placed in cylinders with crocks and sphagnum. The warm end of the Cattleya house in such a position as would suit *Vanda coerulea* will suit it, in fact these two plants are found growing together in India. I have found that *Aerides Fieldingi* likes to be kept rather drier than its fellows during the winter when growth has ceased. Several plants are flowering well in the cool Orchid house at Kew.—C. K.

ZYGOPETALUMS.

THE following few species of *Zygopetalums* are the best known among those which were formerly known as *Pescatoreas*. These Orchids are very peculiar plants to cultivate, and they are seldom seen in good condition. They form hardly any pseudo-bulbs, the leaves are evergreen and distichous, and the flowers are borne singly on scapes produced from between the leaves. A warm and moist atmosphere, such as that of an East Indian house, seems to suit these *Zygopetalums* best. They must be kept moist the whole year round, not requiring any resting period. Pots, baskets, or rafts will all be suited for their cultivation, with peat and live sphagnum to grow in. When grown well the plants produce many flowers, which, being curious and sweetly scented, lend additional interest to any Orchid collection.

Z. Backhouseianum is a pretty species; petals and sepals creamy white tipped with purple, lip creamy white with a fine yellow ribbed callus. It was introduced from Ecuador in 1877 by Messrs. Backhouse & Son.

Z. bellum has flowers 3 inches across, sepals and petals pale purple, barred at the tips with darker purple, lip creamy white with a purplish callus. It was introduced from New Grenada in 1878.

Z. cerinum (fig. 5) has large flowers, sepals and petals greenish yellow, waxy; lip yellow clawed with a large crest inside, which is usually a purple band; leaves about 1 foot long. This is probably

the most easily grown species of the section. It was introduced from Chiriqui in 1851.

Z. Dayanum is very much like *cerinum*; petals white, sepals white tipped with green, lip white, clawed with a purple ruff, the

purple in the lip; and *Z. Dayanum splendens*, a dark violet coloured variety.

Z. fimbriatum is an attractive species, the sepals and petals white with purple tips, lip creamy white spotted with purple and

FIG. 5.—ZYGOPETALUM CERINUM (PESCATOREA CERINA).

base of the lip rayed with purple, the column yellow with a red base. There are several varieties of *Z. Dayanum*, the two best being

Z. Dayanum candidulum, a fine white variety with a tinge of

with a fringed margin; the semicircular crest has dark purple ridges.

Z. Kladochorum has white sepals and petals, tipped with dull purple; the pale yellow lip is three-lobed, the crest is sulphur

yellow with purplish brown ridges, column yellow shaded with purple. This is a very fine species introduced by F. Klaboch from Ecuador in 1879.

Z. lamellosum, sepals and petals straw-coloured, lip white shaded yellow, crest yellow with chocolate ridges. Introduced from Columbia in 1875.

Z. Lehmanni is a large-flowered showy species; the sepals and petals are white veined with purple, the lip is deep purple covered with bristling papillæ, the crest has several brown ridges. Ecuador. —C. K.

ROYAL HORTICULTURAL SOCIETY.

JULY 12TH.

THERE was a very attractive display at the Drill Hall on July 12th, but not a very large number to inspect it. Orchids, Roses, Ferns, hardy flowers, Gaillardias, and fruit were all noteworthy.

FRUIT COMMITTEE.—Present: Philip Crowley, Esq. (in the chair), J. Lee, R. D. Blackmore, H. J. Pearson, Harrison Weir, G. Taber, W. Warren, A. Dean, J. Willard, G. H. Sage, G. Wythes, F. Q. Lane, H. Balderson, J. Cheal, and Dr. Hogg.

A splendid collection of Cherries and Pine Apples came from Mr. Thomas, the Royal Gardens, Windsor, well meriting the silver Banksian medal awarded. The former included splendid baskets of Adams' Crown, Late Duke, Frogmore Early Bigarreau, Florence, Black Eagle, Downton, Knight's Early Black, Bigarreau Napoléon, Frogmore Bigarreau, Governor Wood, Black Tartarian, May Duke, Belle d'Orleans, and Bigarreau Monstrous. Mr. Wythes, Syon House Gardens, received a vote of thanks for a fine collection of Melons, which were also exhibited by Mr. Gilman, Ingestre Hall Gardens, Stafford. A collection of Vegetable Marrows and a few Apples came from the Society's garden at Chiswick, the latter to show the depth of colour in the fruit. Mr. Webb, gardener to A. Bird, Esq., Eynham Lodge, Shepherd's Bush, sent a Tomato named Eynham Hybrid, a cross between Stamfordian and Green Gage, a smooth fruit of the colour of Blenheim Orange. Mr. J. Fitt, The Gardens, Panshanger, Hertford, sent a splendid collection of Queen Pines for which a silver Banksian medal was awarded. He also exhibited a cluster of Ladies' Finger Bananas. Mr. C. J. Terry, Tatton Park Gardens, sent a Melon named The Florence, but like all the other Melons exhibited it was passed. Mr. Leach, Albury Park Gardens, Guildford, sent Carrots and Beetroot, and Mr. Bones, Chiswick, a new Cauliflower.

Messrs. J. Veitch & Sons exhibited a new Broad Bean of dwarf growth, and with small pods, well named *Multum in Parvo*. It grows about 15 inches high, and was loaded with pods, the beans being small and of admirable flavour. This is an acquisition for small gardens, but no award was made. Mr. Crasp, Canford Manor Gardens, Wimborne, received a vote of thanks for two dishes of Peaches, and M. E. Mandet for Mastic Cement. Mr. W. Allan, Gunton Park Gardens, Norwich, exhibited fruits of his excellent Strawberries Gunton Park, Lord Suffield, and Empress of India, also plants in fruit, for which he received a cultural commendation.

Messrs. C. Sharpe & Co. offered prizes for Peas. Mr. Osman, Sutton, Surrey, was first with Sharpe's Queen, Triumph, and Sir F. A. Milbank; Mr. Watkins, gardener to F. Pridden, Esq., Boxgrove, Guildford, second; and Mr. J. Gilbert, gardener to the Rev. L. R. Flood, Merrow Rectory, Guildford, third. Some fine pods were shown.

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair), Messrs. C. F. Bause, B. Wynne, H. Herbst, R. Owen, Norman Davis, G. Phippen, R. B. Lowe, G. Nicholson, W. Goldring, W. C. Leach, J. Bennett-Poe, T. W. Girdlestone, C. Noble, H. Turner, and G. Gordon.

The exhibits brought before this Committee were numerous and of an interesting character. Messrs. J. Veitch & Sons, Chelsea, had a collection of hardy cut flowering shrubs, which included *Stuartia pseudo-Camellia*, *Ligustrum sinense floribunda* (a beautiful thing), *Andromeda speciosa cassinefolia*, *Ceanothus azureus albus flore-pleno*, and *Weigela sessilifolia*. A silver Banksian medal was recommended. A bright collection of Verbena flowers came from Messrs. Cannell & Sons, Swanley, who also showed Begonia Rosebud and Petunia Schwester Bonifatia. The latter, a fringed double variety, was adjudged an award of merit. It is referred to below. A bronze Banksian medal was recommended for Messrs. Cannell's Verbenas. Mr. H. B. May, Dyson Lane Nurseries, Edmonton, showed a large group of small foliage plants and Ferns (a silver-gilt Flora medal). Hardy flowers were shown by Mr. T. S. Ware, Tottenham. The collection included many choice things, such as *Achillea Ptarmica* The Pearl, Gaillardia Aurora, Delphiniums, and Lilioms of sorts. Among the latter were spikes of *Lilium Bloomerianum magnificum*, for which an award of merit was adjudged. A pan of *Callopogon pulchellus* was also shown by Mr. Ware, and a first-class certificate awarded. This is described below. A silver Banksian medal was recommended. Messrs. Kelway & Sons, Langport, had a large collection of Delphiniums, Gaillardias, and hardy flowers (a silver-gilt medal). Several Delphiniums and Gaillardias were adjudged awards of merit, and are referred to below. Mr. C. W. Cousins sent blooms of *Gladiolus Colvilli albus*, for which a vote of thanks was accorded. A large collection of species and garden varieties of Roses came from the Royal Gardens, Kew, and attracted some attention. Messrs. Laxton Brothers, Bedford, had two boxes of Sweet Peas, amongst which Princess May (mauve) and Princess Beatrice (pink) were the most conspicuous.

In the competition for the Mantell challenge cup for twenty-four

trebles of Roses there were three exhibitors: Messrs. B. R. Cant, F. Cant, and G. Paul & Son. The blooms in each case were exceedingly good, but the prize went to Mr. B. R. Cant for a charming collection. The varieties shown were Her Majesty, Countess of Oxford, La France, Earl of Dufferin, Duke of Wellington, Alfred Colomb, Prince Arthur, Duchesse de Morny, Pride of Waltham, Dr. Andry, Mrs. John Laing, Sultan of Zanzibar, Victor Hugo, Ernest Metz (good), Xavier Olibo, Suzanne Marie Rodocanachi, Mrs. Paul, Marie Baumann (very fine), James Dickson, Gustave Piganeau, A. K. Williams, Madame Cusin, Reynolds Hole, and Marie Verdier. Mr. Frank Cant was placed second.

For eighteen bunches of hardy flowers Mr. G. H. Sage, gardener to the Earl of Dysart, was first; and Mr. J. Gibson, gardener to H. Berkeley James, Esq., Carshalton, first for twelve bunches. D. Marshall, Esq., Auchinraith, Bexley, was second with good flowers. Among the latter blooms of *Campanula persicifolia semi-plena* were shown, and adjudged an award of merit; and *Linaria Peloria*, the last named receiving a first-class certificate. Miss R. Dedenham, St. Peters, St. Albans, was first for eight bunches of hardy herbaceous flowers.

Messrs. W. Paul & Son, Waltham Cross, sent two boxes of new Roses, comprising varieties recently described, and the Hybrid Perpetual Clio, for which an award of merit was adjudged. Mr. Charles Noble, Bagshot, sent a spike of *Lilium giganteum*; and Messrs. E. D. Shuttleworth & Co. sent a plant of *Primula Poissoni*; while Messrs. Harrison and Sons, Leicester, sent blooms of a seedling Pink named Mrs. Harrison, a fine white variety.

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair), Messrs. J. O'Brien, T. W. Bond, E. Hill, E. Handley, J. Douglas, S. Cortauld, A. H. Smee, C. J. Lucas, H. M. Pollett, H. Williams, T. B. Haywood, and Dr. Masters.

Messrs. Sander & Co. received a silver Banksian medal for a bright and interesting group, in which *Cypripedium Elliottianum*, *Renanthera matutina*, *Cattleya gigas* with six flowers, C. Batalini, a cross between C. intermedia and C. Forbesi, C. Wallisi, and a variety of *Miltonia vexillaria* with a very deep central blotch were conspicuous. The latter is as yet unnamed and was not placed before the Committee, but no doubt it will be later on. It comes nearest to Leopoldi. The purplish crimson blotch is very rich. Mr. E. Bristow, gardener to J. W. Temple, Esq., Leyswood, Groombridge, had a splendid collection of *Cattleya gigas* blooms, also *Lycaste tetragona*, *Cattleya du Buyssoniana*, and other Orchids. Mr. Duncan, gardener to C. J. Lucas, Esq., Warnham Court, Horsham, received a botanical certificate for *Cypripedium tampense*. Mr. W. H. Robbins, gardener to W. Vanner, Esq., Camden Wood, Chislehurst, received a cultural commendation for *Celogyne Sanderiana* with three spikes of bloom, carrying thirty flowers. Messrs. Hugh Low and Co. had a small collection of *Cypripediums* and *Cattleyas*, also *Pescatorea cerina* and *Dendrobium crystallinum album*. Messrs. Charlesworth, Shuttleworth & Co, Heaton, Bradford, received a silver Banksian medal for a collection of *Oncidiums*, such as *macranthum Williamsi*, *lameligerum*, *curtum*, and *Gardnerianum*.

CERTIFICATES AND AWARDS.

Phalaenopsis × *Artemis* (J. Veitch & Sons).—A charming hybrid gained by crossing *P. rosea* with *P. amabilis* (Blum), *P. grandiflora*, *Lindl.* The sepals and petals are white faintly suffused with rose at the base; the lip is deep rose, bronzy yellow at the base. The staminode is white with chocolate dots and the column rose (award of merit).

Dendrobium crystallinum General Berkeley variety (Major-General Berkeley).—A charming form with a profusion of small pendent flowers. The lip is white tipped with rosy crimson, the base rich yellow; the sepals and petals are white, suffused and heavily tipped with crimson (award of merit).

Cypripedium Stonei candidum (Pitcher & Manda).—This may be fairly described as a pale form of *Stonei*, following it in character, but differing in colour. The dorsal sepal is ivory white veined with brown, the lower sepal white with a slaty suffusion. The base of the lip and the frilled staminode are white, the pouch veined with rose. The petals are long, narrow, and twisted, light green dotted with chocolate, the tips deep purple (award of merit).

Petunia Schwester Bonifatia (H. Cannell & Sons).—This is an attractive fringed double variety of a magenta-pink shade (award of merit).

Lilium Bloomerianum magnificum (T. S. Ware).—An attractive Lily, the flowers being medium in size, and rich in orange colour, covered with dark red and chocolate spots. Two spikes were shown, one of them carrying twenty expanded flowers and buds (award of merit).

Callopogon pulchellus (T. S. Ware).—This is a charming plant. The blooms are small, and borne on slender spikes, four or five on each. Colour bright rosy mauve (first-class certificate).

Gaillardia Mrs. Pitcher (Kelway & Sons).—A most attractive variety. Flowers large, reddish brown, edged with bright gold (award of merit).

Delphinium Henry (Kelway & Sons).—This is a decided acquisition. Spike and flowers large, and rich blue in colour, semi-double (award of merit).

Delphinium Princess May (Kelway & Sons).—Flowers large, single, of a mauve or heliotrope colour, margin of the outer petals shading to light blue (award of merit).

Delphinium Sailor Prince (Kelway & Sons).—A grand variety, with large deep blue flowers.

Campanula persicifolia semi-plena (Mr. W. Marshall).—This is a showy variety, with large semi-double dark blue flowers.

Linaria Peloria (W. Marshall).—Noteworthy for the transformation in the form of the corolla, which is conical. The flowers are lemon yellow borne in spikes (first-class certificate).

Rose Clio (W. Paul & Son).—This is a Hybrid Perpetual of sterling merit. The blooms shown were large, of good form, blush pink in the centre, the outer petals being white (award of merit).

ROSE SHOWS.

DISS.—JULY 5TH.

THE Diss Horticultural Society is unfortunate. The date of fixture for its summer Show generally invites Jupiter Pluvius, and he seldom refuses to put in an appearance. The Committee depend upon the attendance of the gentry in the neighbourhood, but a soaking afternoon frightens away the ladies, and makes cautious those who realise the dangers of thin soles on wet turf. Beginning this year with an adverse balance of £26, the constant and heavy rain on the afternoon of the 5th July will greatly add to the financial burdens of the Society. We were all sorry indeed for the plucky Honorary Secretary, but the Rev. F. Page-Roberts is not one to give in easily, and doubtless his untiring energy, combined with his wide popularity, will "bring the ship round."

Roses and other cut flowers, fruit and vegetables, table decorations, plants in pots, and the usual cottagers' classes, all went to make a very good Show, the quality being generally very good. As for the Roses, in five out of the six classes the competition may be described as a tussle between Suffolk and Norfolk parsons. For thirty-six distinct single, (open), the first prize was won by Mr. Benjamin Cant, very closely followed by the Rev. F. A. Foster Melliar, Messrs. Prior of Colechester being third. In Mr. Cant's stand were—Back row: Etienne Levet, Mrs. J. Laing, Earl of Dufferin, Viscountess Folkestone, Auguste Piganeau (very good), La France, Victor Verdier, Dupuy Jamain, François Michelin, Le Havre (good), Innocente Pirola, and Maurice Bernardin. Middle row: Marchioness of Dufferin, Duke of Edinburgh, Pride of Waltham, Fisher Holmes (good), Niphetos, Marie Baumann, Duchesse de Vallambrosa, A. K. Williams (good), Madame de Watteville, M. de St. Amand, and Prince Arthur (good). Front row: Thos. Mills (very good), Annie Laxton, Reynolds Hole, Heinrich Schultheis, Victor Hugo (grand), Germaine Caillot, Madame Désir, Merveille de Lyon, Horace Vernet, Maréchal Niel, Lady Helen Stewart, and Gabriel Luizet. In the second prize stand were very good Roses, but Mr. Foster Melliar had kept his best for the next class with the idea of taking back to Sproughton Rectory the splendid silver cup which he had brought in the morning. However, he was only a very little way behind Mr. B. Cant. He had a grand Gabriel Luizet, while Dr. Andry, Marie Van Houtte, Marie Baumann, The Bride, Duke of Teck, Mrs. Paul, and E. Y. Teas were very good. In the third prize stand Prosper Laugier, Madame Cusin, and Alphonse Soupert were very fine.

The next class created most excitement, as the winner holds for a year a splendid challenge cup, value £10, given in memory of the late Rev. Henry Temple Frere. Mr. Foster Melliar has now won it a second time. His Roses were remarkable for their size, colour, and freshness, very superior to any he had at the Crystal Palace the Saturday before. A few we must mention as particularly fine: Gustave Piganeau, A. K. Williams, Mrs. Baker, Eugène Fürst (very rich), Her Majesty, Mrs. Paul, Star of Waltham, and Marie Verdier. The Rev. H. A. Berners of Harkstead Rectory was a good second, being very strong in Teas. In this box a bloom of Jean Soupert won the silver medal as the best H.P. in the Show. The Rev. A. L. Fellows was third, and the Rev. F. Page-Roberts fourth; verily a parson's competition. For twelve distinct the Rev. F. Page-Roberts was first with a very good box indeed, very bright and clean; the second and third prizes going to Geo. Palmer, Esq., and E. N. Bunn, Esq., of Harleston respectively. There were some respectable flowers shown in the local classes.

The Teas were excellent. The Rev. H. A. Berners was easily first for twelve distinct, his flowers having great depth, substance, and colour. This was a splendid box:—Back row: Comtesse de Nadaillac (silver medal for best Tea), Innocente Pirola, Ethel Brownlow, Etoile de Lyon (beautiful). Middle row: The Bride, Souvenir d'Elise, Madame Hoste (very fine), C. Mermet. Front row: Souvenir d'un Ami, Maréchal Niel, Hon. E. Gifford, and Francisca Kruger. The Rev. the Hon. Secretary was second with smaller and not quite so clean flowers. However, Innocente Pirola, La Boule d'Or, and Niphetos were beautifully represented. The third prize Rev. A. Foster Melliar gained. Alfred Bobby, Esq., the Rev. A. Farquharson, and the Rev. A. L. Fellows were not successful in this excellent class.

Your reporter cannot but endorse the opinion of many good judges present, that the herbaceous flowers were most excellent and interesting, and he has much pleasure in reporting here the success of the Rev. F. Page-Roberts.

BAGSHOT.—JULY 5TH.

IF Surrey does not send forth the Roses which secure the leading prizes of the year, it has a numerous contingent of what may be termed second class growers, and their numbers are added to by cultivators in the neighbouring counties. At Bagshot Show the most prominent rosarians were not present, but their places were creditably filled by smaller growers, who exhibited amongst them some admirable blooms. This applies particularly to the amateurs.

In the trade class for forty-eight blooms there was unfortunately no competition. This was partly owing, no doubt, to the fact of the fixture

elashing with the Show at Earl's Court, where the numerous large classes placed no inconsiderable strain on the resources of the growers. In the leading amateurs' class some admirable blooms were shown by F. W. Flight, Esq., Cornstiles, Twyford, who achieved a highly creditable victory. W. Colin Romaine, Esq., The Priory, Old Windsor, was second, and he also had some good blooms, Mr. J. T. Strange, Aldermaston, being third. T. W. Girdlestone, Esq., Sunningdale, won with twelve Teas or Noisettes: he had a delightful stand, the flowers being noteworthy for freshness and beauty of tone. Amongst them was a splendid bloom of Souvenir d'Elise Vardon, which secured the National Society's silver medal, and as will be seen from our report of Windsor Show the same flower won a similar honour there. Mr. Flight was second, and Mr. Page third. There were some good flowers in the class for six blooms, Mr. Girdlestone being again first, and Mr. Morsman second. The stands of Messrs. Flight and Romaine were so close that they were placed equal first.

The Connaught challenge cup was in competition in a class for twenty-four blooms confined to growers within a radius of twelve miles, and Mr. Romaine secured it with an excellent stand. His blooms were fresh and well finished, the best being a very fine Sir Garnet Wolseley, which won the N.R.S. silver medal as the best H.P. in the Show. Mr. Page was second. The flowers were not so good in the class for twelve, and only second prize was awarded, this going to Mr. J. W. Wix. Messrs. Page, Popple, and Wix secured the prizes for six. Mr. Romaine won with Teas and Noisettes, Mr. Page following. The prizes for growers within a five-miles radius went to Messrs. Page, Popple, Wix, Christmas, and Twort; and those in the cottagers' classes to Messrs. Higgs, Soan, and Baigent.

In the classes for plants, fruit, and vegetables there was some excellent produce, especially in those where the special prizes offered by Messrs. Carter & Co. were in competition.

GLOUCESTER.—JULY 5TH.

(From a Correspondent.)

THE rain and the Roses had a hard fight on the occasion of the Gloucestershire Rose Society's Show this year—the former by pouring incessantly during the whole time the Exhibition was held, tending to keep the public away, the latter to draw them to it. I hardly know which had the better of it; that will transpire in the balance sheet, no doubt, but if the attendance was not so large as it would have been had fine weather prevailed it might have been far worse. Those who braved the rain were rewarded by seeing an admirable display of flowers, and were more than satisfied, even if, like myself, they had to put up with a soaking.

Mr. Frank Cant came out strongly in the principal class, which was for seventy-two blooms, having bright, fresh, well-finished examples; his Ernest Metz, Marie Baumann, Pride of Reigate, Général Jacqueminot, Lady Mary Fitzwilliam, Horace Vernet, Caroline Kuster, Alfred Colomb, and Gustave Piganeau were excellent. The English Fruit and Rose Growing Company were second, and Messrs. Cooling & Son third. The latter won with forty-eight, and if hardly up to Mr. Cant's form they were still a very good collection. Their Madame Gabriel Luizet, Innocente Pirola, and Mrs. J. Laing were very good blooms, although, so far as I have seen, the last named is not quite up to the usual standard this year. The English Fruit and Rose Company were second, and Messrs. W. & J. Jefferies third. Mr. Frank Cant secured his second premier award in the class for twenty-four trebles, and there was no gainsaying the quality of his flowers, albeit he is not generally seen at his best with threes. His A. K. Williams, Ernest Metz, Heinrich Schultheis, and Gustave Piganeau were very good. Messrs. Cooling and Son were second, the English Fruit and Rose Company third. Messrs. Jefferies, Mattock, and Treseder secured the prizes for thirty-six singles in the order named. The classes for blooms of one variety were, as they always are, very beautiful. Mr. Frank Cant had the best twelve of a dark variety, A. K. Williams representing him. Mr. Drew was second with Marie Baumann, and Messrs. Cooling & Son third with Abel Carrière. Mr. Budd was first with twelve of a light variety, winning with a charming box of the Hon. Edith Gifford, Mr. Frank Cant being second with Madame de Watteville, and Mr. Treseder third with Lady Mary Fitzwilliam. Maréchal Niel in fine condition secured the first prize for Mr. Hill Gray in the yellow class, Mr. G. Prince being second with Comtesse de Nadaillac, and Mr. Mattock third with Maréchal Niel. Mr. Hill Gray also won with six each of the Hon. Edith Gifford and Anna Ollivier, of which he had very chaste blooms. Mr. Mattock was second, and the Rev. F. R. Burnside third. Mr. Gray's next victory was with six of any Tea, in which class he exhibited Comtesse de Nadaillac in beautiful condition. Mr. Burnside also had the Comtesse in his second prize box, the English Fruit and Rose Co. coming in third with The Bride.

Mr. Geo. Prince showed Teas splendidly in the open class for eighteen, and fairly beat Mr. Frank Cant. His Souvenir d'Elise Vardon, Ernest Metz, and Comtesse de Nadaillac were a beautiful trio. Mr. Mattock won with twelve, Messrs. Jefferies being second, and Messrs. G. & W. H. Burch third. Messrs. Cooling & Son were first for garden Roses, and I could find no other box. Mr. Mattock had the winning basket. Mr. W. Drew won the N.R.S. medal for the best H.P. with A. K. Williams, and Mrs. Cuthbert that for the best Tea with Innocente Pirola.

Mr. Conway Jones, Mr. T. A. Washbourn, Mr. Hopton, Mr. D. T. Mitchell, Mr. H. M. Hartland, Mr. T. Thorpe, and Mr. J. Middlecote had some excellent flowers in other classes.

HITCHIN.—JULY 6TH.

In the pleasant grounds attached to the Hitchin Grammar School this Society held its annual Exhibition, and it was in all respects an admirable Show. The Society has widely extended its scope from the days when I remember it at its beginnings, when all was comprised in one small tent not very well filled. Now several tents were well filled by various exhibits in the varied branches of horticulture, and anyone going through the tents could see at a glance that there must be a good deal of horticultural zeal in Hitchin and its neighbourhood. Roses, indeed, formed the *pièce de résistance*, but they were flanked by many a dainty dish. One tent was filled by an admirable collection of table and other decorations, in which much taste and skill were displayed; another was filled with a capital collection of fruit and vegetables, and with cottagers' productions. These are sure always to attract considerable attention, and were here well deserving of it. I only notice these matters in passing, for of course I have specially to do with the Rose. There had been some rain the evening before, and fears were entertained as to whether Hitchin would follow its too general course of having a wet day; but the morning broke fine, the sun came out brilliantly, and the Roses where they had been protected from the rain of the night before were all the better for it, and as there was a cool breeze the flowers stood uncommonly well throughout the day; indeed, so far this has been a characteristic of the season.

As Mr. Lindsell was at home his Roses were expected to be in fine condition, and so undoubtedly, they were; but withal I do not think that they were equal to the stand of forty-eight which he exhibited at Earl's Court the day before. This stand I regard as the very best box of Roses I ever remember to have seen. There used to linger in my memory a box of thirty-six I once saw exhibited by Mr. Jowitt in his palmiest days at Birkenhead as the finest box I ever saw, but I must now give it the second place and give the place of honour to this box. There were flowers in it one cannot get out of one's mind, especially a bloom of Horace Vernet. I remember a triplet of this flower I once saw exhibited by Mr. Pemberton at Farningham as grand specimens of this fine but difficult flower, but this flower was a beat on them. So grand was the box that the authorities adjudged it a gold medal for the best exhibit of the day, not merely of Roses but of everything shown, whether fruit, flowers, decorations, or anything else in this varied and beautiful Exhibition. I have wandered away from my subject, but as I shall not have the opportunity of commenting on this Show I wished to give my estimate of its excellence.

I now revert to the Roses at Hitchin, and had perhaps better take them in the order in which they occur in the schedule, taking the nurserymen first. Although the class for forty-eight was open, yet only the trade competed in it, and four excellent stands were staged, Messrs. Paul & Son exhibiting the best box of blooms they have shown this season, and Mr. Burrell running a close second, while Messrs. Burch and Son and Merryweather ran very close for the third, so close that the Judges awarded an extra prize to the stand shown by the latter firm. Messrs. Paul's box contained Her Majesty (grand flower), Earl of Dufferin, Maréchal Niel, Eclair, Maurice Bernardin, Mrs. John Laing, Lady Mary Fitzwilliam, Camille Bernardin, Comte Raimbaud (bright and fresh), Mrs. Paul (very excellent and distinct), Duke of Edinburgh (very fine and bright in colour), Marie Rady, Catherine Mermet, Comtesse d'Oxford, Jean Ducher, Mrs. Geo. Schwartz, A. K. Williams (a grand bloom, fine form and colour), Ella Gordon, Jeannie Dickson (very pretty), Mrs. Charles Wood (very fine), Souvenir d'un Ami, Henri Lédéchaux, Madame Gabriel Luizet, Countess Rosebery, Vicomtesse Folkestone, Pride of Waltham, Sénateur Vaisse, Baroness Rothschild, Dr. Andry, La France, Etienne Levet, Merveille de Lyon, E. Y. Teas, Perle des Jardins, Black Prince, Capt. Christy, Horace Vernet, The Bride, Boieldieu, Madame Hoste, Alfred Colomb, M. de St. Amande, Duke of Connaught, Comtesse de Nadaillac, and Grandeur of Cheshunt. Messrs. Burrell & Co. were second, Messrs. Burch & Son third, and Messrs. Merryweather & Sons fourth. In Mr. Burrell's stand were fine blooms of Duchess of Bedford, Horace Vernet, Ernest Metz, and Reynolds Hole.

In the class for amateurs, twenty-four distinct varieties, Mr. Lindsell was easily first, Mr. Gurney Fowler a good second, and Rev. W. H. Jackson third. Mr. Lindsell's flowers were the following—Grand Mogul (extra fine bloom of this variety), Mrs. John Laing, Earl of Dufferin, Her Majesty, Horace Vernet (very fine), Madame G. Luizet, Ulrich Brunner, Lady Mary Fitzwilliam, Madame Cusin, Prince Arthur, Caroline Kuster, Dr. Sewell, Dupuy Jamain (grand), Duke of Teck, La France, Louis Van Houtte, Duchess of Bedford, Comtesse de Nadaillac, A. K. Williams, Duchesse de Morny, Reynolds Hole, Etoile de Lyon, Le Havre, Madame E. Verdier. In the class for twelve Teas Mr. Lindsell was first again with a very beautiful stand indeed, consisting of Princess of Wales, Cornelia Koch, Madame Cusin, Souvenir d'Elise, Anna Ollivier, Catherine Mermet, Innocente Pirola, Jean Ducher, Comtesse de Nadaillac, The Bride, Caroline Kuster, and Madame Margottin. Rev. W. H. Jackson was second, and H. V. Machin, Esq., third.

In the class for twelve distinct varieties, Mr. Jas. Parker, Oakfield, Hitchin, was first. His flowers were Her Majesty, A. K. Williams, François Michelin, C. Darwin, Charles Lefebvre, Madame G. Luizet, Alfred Colomb, Madame E. Verdier, Marie Verdier, Duc de Rohan, Duchesse de Vallombrosa, Rossieriste Jacobs. Mr. G. Moules of Hitchin was second, having a grand Merveille de Lyon, which took the silver medal of the National Rose Society for the best H.P. in the amateurs'

classes. Lord Hardwick (gardener, Mr. Burgess), was third, and Miss Bailey, Denton, fourth.

In the class for nine distinct varieties Mr. C. Kingsley, Little Wymondham, was first with a box containing Fisher Holmes, Charles Darwin, Prosper Laugier, A. K. Williams, Marie Rady, Duchess of Bedford, Mme. G. Luizet, Reynolds Hole, Duke of Wellington. Mr. A. Times was second, Mr. A. Albow third, and Mr. A. Ransom fourth. In the class for six distinct varieties Mr. G. Moules was first with box containing A. K. Williams, Francisca Krüger, Ulrich Brunner, The Bride, Duke of Edinburgh, Souvenir d'un Ami. Miss A. M. Lucas was second, Mr. W. Ransom third, and Mr. Savage fourth. In the class for six Teas Mr. J. Parker was first with Comtesse de Nadaillac, Mme. Cusin, Marie Van Houtte, Etoile de Lyon, Catherine Mermet, Mme. de Watteville. Mr. G. Moules was second, and Colonel Fyler third. In six H.P.'s of one Mr. J. Gurney Fowler was first with a good stand of Charles Lefebvre; Mr. W. H. Jackson second, and Miss Bailey Denton third, both showing Mme. G. Luizet. In six Teas of one kind Mr. E. B. Lindsell was first with Catherine Mermet, Mrs. Times second with Maréchal Niel, and Rev. W. H. Jackson third with C. Kuster. In the class for six, open only to those who had not taken a prize, Mr. H. Hunt was first, Mr. R. H. Baker second, and Mr. W. Hill third.

I have already spoken of the herbaceous plants at this Show. Noticeable amongst them was a beautiful collection from Messrs. Burrell and Co., Cambridge. Mr. J. H. Tuke had also a good collection from his beautiful garden. Messrs. Burrell's group was most admirably set up, the contrasts between the different colours being very effective, and altogether it was a very striking exhibit.—D., Deal.

NORWICH.—JULY 7TH.

[From a Correspondent.]

THERE was an unfortunate clashing on Thursday, the 7th July, affecting very seriously the classes for Roses. How it came to pass that the executives of the Norwich and Woodbridge Societies failed to come to some amicable arrangement whereby the two Shows might have been held on different days I am at a loss to conceive. The consequence was that the Roses at Norwich were very weak in numbers, although of quite an average quality. The Show was held in Earlham Park, distance from Norwich nearly three miles. This park is admirably suited for horticultural shows, yet it is rather hard on amateurs and nurserymen to have the annoyance of a long road journey after a very long railway one. A gale of wind made things unpleasant, especially as it lifted a large marquee and blew it clean over. The exhibits, chiefly fruit, were transferred to the Rose and cut flower tent, which, being in a more sheltered position, withstood the hurricane.

The nurserymen were poorly represented—in fact, Mr. B. R. Cant "walked over," no other nurseryman turning up. This was unfortunate, for there were four or five nurserymen who entered in the class for forty-eights, the first prize being given by the Mayor of Norwich (H. Reeve, Esq.); however, the prize was well earned. Mr. Cant had excellent examples of Her Majesty, Duchesse de Morny (lovely, reminding one of the Mornys of Mr. Jowitt nine years ago), Etienne Levet, Augustine Guinnoisseau, Eclair, F. Michelin, Marquise de Castellane (not now so often seen as it should be), Victor Hugo (grand), Earl of Dufferin, Jeannie Dickson, Comte de Raimbaud (very good), Thos. Mills (excellent), Innocente Pirola, Mrs. J. Laing, G. Piganeau, A. K. Williams, and Lady M. Fitzwilliam. For eighteen distinct varieties, three trusses of each, Mr. Benjamin Cant was, of course, again the only exhibitor; but he quite upheld the standard of the year, though this standard is not, in my opinion, a very high one.

In the amateurs' class for thirty-six distinct single blooms, the Rev. J. H. Pemberton, of Havering-atte-Bower, was first, though many were of opinion, myself amongst them, that Mr. Foster Melliar should have been adjudged the first prize. Both stands were excellent, and Mr. Pemberton probably won by "patience in staging," for at three o'clock in the afternoon he was quite out of it, whereas Mr. F. Melliar's stand had perceptibly improved. Mr. Pemberton had grand blooms of Annie Laxton, Exposition de Brie, Ethel Brownlow, Marie Baumann, Beauty of Waltham, Dr. Andry, and Duke of Teck.

In the second prize stand, Mr. F. Melliar not only won the medal for the best H.P. (A. Colomb) but had grand specimens of A. K. Williams, Caroline Kuster, Her Majesty, Ed. Harvé, Marie Baumann (excellent), and Horace Vernet, which bloom, methinks, the excellent rosarian of Sproughton Rectory thought should have had the medal, but even judges who are not amateurs are fallible. There was a good competition for the twenty-fours, but nothing special as to quality.

And now for the Teas. The Rector of Harkstead was easily first for twelve singles. How Mr. Berners manages to "score" as he does in this class astonishes me. He manages to beat thoroughly many who grow twice or thrice the number of plants that can be found in the Harkstead Rectory gardens. His gardener, too (Mr. G. Jordan), is to be thoroughly congratulated, for he has worked hard and well. I do not mean to say that Mr. Berners has any particular credit in being ahead of the champions of Sproughton and Scole, for the disasters of the past winters have probably been more severely felt by Mr. Foster Melliar and Mr. Page Roberts than by the Harkstead Rector. Still, Harkstead is a miracle in Teas. Whether it is the water administered by a particular Jordan I know not! However, I am digressing, and must come to the point as to the names of Mr. Berners' best Teas. Here they are:—Maréchal Niel, Souvenir d'Elise, Madame de Watteville (silver medal, grand), Madame Hoste (if anything grander), Princess of Wales, Ernest Metz (very good), Innocente Pirola, Comtesse de Nadaillac, The Bride,

Souvenir d'un Ami, E. Brownlow, and C. Mermet. A very beautiful and even stand. The second prize was won by the Rev. F. Page Roberts with a most creditable lot, very closely followed by the Rev. A. Foster Melliar. The classes for twelve and six of one sort, H.P.'s and Teas, were fairly represented. In the twelves Mr. Berners was first for Comtesse de Nadaillac, and the Rev. A. S. Fellows second with La France. The sixes were poor.

In the Norwich *Daily Press* report of this Show I notice that these two charming Roses, La France and Nadaillac, are put down as "Hardy Perennials." Quite true! H.P. may stand for almost anything. Hollow (Crown) Parsnips, or High (Church) Parsons! I must not forget the grand exhibition of herbaceous flowers—hardy perennials indeed! The well-known East Anglian names of Page Roberts, Corder, Farrer, Frere, Back, with Mrs. Petre, are sufficient to prove what a treat those of your readers have missed by not turning up at Earlham Park on the 7th of July, 1892.

BATH.—JULY 7TH.

ALTHOUGH a considerable number of exhibitors who entered in various classes failed to keep their engagements, many of them not even notifying their defection, the Show was very well filled, and an excellent one all round. The weather though very bad for the blooms a day or two previous, heavy storms damaging them considerably, proved more favourable than anticipated, and the attendance was good accordingly.

There were only three exhibitors in the premier class—that for seventy-two varieties, single trusses—and the Judges had no great difficulty in awarding the first prize to Mr. B. R. Cant, Colchester, whose stands comprised a good even lot of fresh blooms, the varieties consisting of Mrs. J. Laing, Crown Prince, Alfred Colomb, Baroness Rothschild, T. W. Girdlestone, Duchess of Albany, Maurice Bernardin, Abel Carrière, Marie Verdier, Marchioness of Dufferin, Madame Victor Verdier, Marie Finger, Earl of Dufferin, Mrs. Paul, Marie Baumann, Her Majesty, Ulrich Brunner, Xavier Olibo, Merveille de Lyon, C. Darwin, Jean Dueher, Thomas Mills, Madame de Watteville, Sénateur Vaisse, Duchesse de Morny, Mrs. Laxton, Souvenir de Paul Prince, Le Havre, Souvenir d'Elise Vardon, Horace Vernet, Madame Cusin, Dupuy Jamain, Madame Angèle Jacquier, Duke of Edinburgh, Maréchal Niel, Benoit Comte, Caroline Kuster, Harrison Weir, Violette Bouyer, Camille Bernardin, The Bride, Elclair, Viscountess Folkestone, Suzanne Marie Rodocanachi, Margaret Dickson, Beauty of Waltham, Madame Eugénie Verdier, Annie Wood, Innocente Pirola, Marie Rady, François Michelin, Fisher Holmes, Ernest Metz, A. K. Williams, John Hopper, Mons. E. Y. Teas, Madame Gabriel Luizet, Général Jacqueminot, Margaret Bondet, Cheshunt Hybrid, Etienne Levet, Prince Camille de Rohan, Madame Delville, Prince Arthur, Comtesse Panisse, Victor Hugo, Marie Cointet, and Reynolds Hole. The Hereford Fruit and Rose Company were a very creditable second, and Messrs. G. Cooling & Sons, Bath, a close third. With thirty-six trebles Mr. B. R. Cant was again first, his best being Mrs. J. Laing, Marie Baumann, Maurice Bernardin, Etienne Levet, The Bride, and Comte de Raimbaud. Messrs. Cooling & Sons were a good second, their stands comprising excellent blooms of Victor Hugo, Xavier Olibo, Earl of Dufferin, and Suzanne Marie Rodocanachi. The Hereford Company were placed third.

The competition was much better in the class for eighteen trebles, six lots being staged, and here Messrs. Curtis, Sanford & Co., Torquay, were easily first; Mr. J. Mattock, Oxford, was second; and Messrs. Keynes, Williams & Co., Salisbury, third; each having many excellent blooms. Seven staged in the class for thirty-six varieties, singles, but Messrs. Curtis, Sanford & Co. were well ahead of all the rest, their stands comprising some of the best blooms seen in the Show. Mr. John Jefferies, Cirencester, was second with a fresh even lot. Mr. C. Turner, Slough, took the remaining prize. The only other class confined to nurserymen was that for eighteen Teas or Noisettes, distinct, and with these four competed. Mr. J. Mattock was first with good examples of Madame Lambard, Souvenir d'Elise Vardon, Comtesse de Nadaillac, Hon. E. Gifford, Ernest Metz, The Bride, Miss E. Brownlow, Madame Hoste, Madame de Watteville, Jean Dueher, C. Mermet, Rubens, Souvenir d'un Ami, Niphetos, Princess of Wales, Cornelia Koch, and Anna Ollivier. Mr. B. R. Cant was second, and Mr. J. Jefferies third.

Amateurs did not muster so strongly as usual, Dr. Budd, Bath, having a walk over in the classes for thirty-six varieties, and eighteen varieties, distinct, taking the silver cup in the former, and also the first prize in the other. He had grand blooms in both instances. In the class for twenty-four varieties the competition improved considerably, but Mr. W. Drew, Ledbury, was well first with fine blooms of Merveille de Lyon, Dupuy Jamain, Mrs. J. Laing, Marie Baumann, La France, Louis Van Houtte, Duchesse de Vallombrosa, Earl of Pembroke, Queen of Queens, Prince Arthur, Marchioness of Dufferin, Duchesse de Morny, Duchess of Bedford, Her Majesty, Comte de Raimbaud, Madame C. Crapelet, Mons. E. Y. Teas, The Bride, Ulrich Brunner, Lady Mary Fitzwilliam, Earl of Dufferin, François Michelin, and A. K. Williams, the last mentioned being very fine. Mr. W. Narrowway, Oxford, was a good second, and Mr. R. B. Cater, Bath, third. Mr. A. H. Gray was highly commended for a stand principally composed of Teas; Mr. Drew was also first for twelve varieties, Mr. J. Rawlins, Cirencester, being second, and Mr. W. Narrowway third. Mr. J. Hinton, Warminster, was highly commended, and also received a silver medal for the best Tea in the Show, a large but not particularly well formed bloom of Catherine Mermet. With twelve triplets Mr. Drew was first, Mr. W. Narrowway second, and Mr. A. Evans, Oxford, third.

A beautiful lot of Teas and Noisettes were shown by amateurs, and

of these the best eighteen varieties, single trusses, came from the Rev. F. R. Burnside, Hereford, and a grand lot they were. Mr. A. H. Gray was second, and Dr. Budd third. With twelve varieties Mr. Herbert Fowler, Taunton, was easily first, having very fine blooms. Mr. W. Drew was second, and Mr. W. Narrowway third. With six Teas the Rev. F. R. Burnside was first, Mr. A. H. Gray second, and Mr. Evans third.

In all the open classes there was good competition, and the blooms generally were of great excellence. In the class for twelve blooms of any Rose Mr. A. H. Gray was first for Maréchal Niel at its best, Messrs. Keynes, Williams & Co. being second with Niphetos. Mr. Gray repeated his success in the next class, that for any yellow Rose, with another good stand of Maréchal Niel, Mr. B. R. Cant being second with the same variety. The best six blooms of La France were also staged by Mr. Gray. The first prize for six blooms of any new Rose went to Mr. B. R. Cant for Gustave Piganeau. Messrs. Curtis, Sanford & Co. were second with the same variety.

Local prizes were competed for in a more spirited manner than usual, but Dr. Budd easily won the first prize and gold medal of the National Rose Society, offered for the best twenty-four varieties, single trusses. This was really one of the best stands in the Show. His Marie Rady gained a silver medal, offered for the best Hybrid Perpetual in the Show. Mr. A. H. Gray was second, and Mr. J. T. Holmes third. Other

FIG. 6.—CYPRIPEDIUM SOUTHGATENSE.

successful local exhibitors were Messrs. R. B. Cater, W. J. Harte, and E. G. Garraway.

Baskets of Roses were numerous and beautifully arranged. Mr. J. Rawlins, Cirencester, was first; Mr. E. S. Cole, Bath, second; and Mr. J. Mattock third. Two classes were provided for hand bouquets of Roses with their own foliage, and of these there was an extraordinary display, fully seventy bouquets being shown. The first prize for twelve bouquets was well won by Mr. J. Mattock, Teas with their coloured foliage predominating in this instance, while Messrs. Cooling & Sons were a good second. The best six were shown by Mr. W. Narrowway, Mr. R. B. Cater being second, and Mr. J. H. Thresher, Frome, third. Begonias, both plants and cut blooms, were fairly well shown in the classes provided for them, Messrs. H. Fowler, R. W. Beachy, D. S. Carr, J. B. Blackmore, and F. Hooper being the principal prizewinners. Mr. R. B. Davis, Yeovil, staged cut Begonias in his usual effective style, the doubles being remarkably fine.

WOODBIDGE.—JULY 7TH.

WHEN requested to assist in awarding the prizes at Woodbridge, one of the Judges had to mentally confess his ignorance of the location of the little horticultural town, but had an impression that it was somewhere in East Anglia. He went down to Ipswich, and sought inspiration from Mr. Spencer King, an ardent amateur; refreshed himself with the Strawberries of Mr. Garrod, a fine specimen of a market gardener; and with something else during a call to see the beautiful garden of Mr. Limmer, a business magnate; then went on his way more than satisfied with his progress so far, and wondering what the end of his journey would reveal. A crowded platform, a struggle with Rose boxes, a street ahead festooned with gay colours, and a flag surmounting a splendid church tower were sufficient assurances that he had arrived at the right place, and that the flower Show day was a day of rejoicing in

the little Suffolk town—a small town of some 4000 inhabitants, but very far from a proportionately small Show. It was really a large Show, diversified and excellent, larger and better than can be found in many towns of ten times the size in any year. The beautiful Abbey grounds, with finely timbered surroundings, kindly granted for the day by R. J. Carthew, Esq., presented quite an animated appearance with the several marquees, especially when the visitors, apparently in thousands, came flocking in, and when the military bands were vying with each other to gain the ear of the multitude on the pleasant summer's day. "We always have a fine day for *our* Show," remarked one who was evidently interested in it; "but it always rains at Ipswich." He meant on Show days, half implying that with a little Woodbridge acumen they might manage things better in the chief county town in the matter of weather.

The Show to which brief reference is now to be made was the forty-first annual Exhibition of the well supported Woodbridge Horticultural Society. Though associated with the N.R.S., the Shows are a great deal more than exhibitions of Roses. The Rose classes were, however, accorded the place of honour in the schedule, and some of them possessed more than local interest. It will be conceded that it was a spirited thing to offer a 25-guinea challenge cup with the N.R.S. medal for twenty-four Roses, even though the trophy has to be won thrice by an exhibitor before it becomes his property. In the first contest for the handsome cup the "two Cants" put forth their strength, and most good rosarians know what that is. After a close scrutiny by the careful and competent Mr. Burrell and his coadjutors Mr. Frank Cant was found to have won by a few points. Very charming were the blooms in both stands, not so much for size as for form, with freshness, brightness, and purity. The varieties in the winning stand were A. K. Williams, Mrs. J. Laing, Horace Vernet, Her Majesty, The Bride, Madame Eugène Verdier, Etienne Levet, Ernest Metz, Madame H. Pereire, Germaine Caillot, François Louvat, Suzanne Marie Rodocanachi, Duke of Teck, May Rivers (a lovely bloom), Star of Waltham, Madame de Watteville, Comtesse de Ludre, Lady Mary Fitzwilliam, Mary Bennett, Maréchal Niel, John Hopper, Souvenir d'Elise, A. Colomb, and Madame Hoste. Many of the blooms in Mr. B. Cant's were equally good, notably Her Majesty, Niphotos, Marie Baumann, Suzanne Marie Rodocanachi, and others; but a few were just passing the zenith of their beauty. It was a noble stand, and the younger man will have something to do to win another time.

In the class for forty-eight, distinct varieties, there was good and close competition, Mr. Frank Cant securing the premier place. Messrs. Prior & Son, Colechester, were second with very good blooms, though it is by no means certain they would have secured this position if another exhibitor had not destroyed his chance by the accident of two fine blooms of Mrs. Paul finding their way into his stands.

The open class for twelve distinct Teas and Noisettes brought stands of first-class quality, the two exhibitors last named occupying the same relative positions. The first prize varieties were Madame de Watteville, Niphotos, Ernest Metz, Madame Cusin, Innocente Pirola, Cleopatra, Maréchal Niel, The Bride, Madame Hoste, Marie Van Houtte, Catherine Mermet, and Jean Ducher. In the class for six blooms Mr. O. G. Orpen, West Bergholt, was first with particularly fine examples of Madame Hoste (awarded the N.R.S. silver medal for the best bloom in the open classes), The Bride, Maréchal Niel, Ernest Metz, Catherine Mermet, and Niphotos. Mr. E. N. Bunn, Harleston, and Mr. John Woods, Woodbridge, secured the remaining prizes in the order named with creditable stands. The remaining class in the open section was for twelve H.P.'s, trebles, the first prize for which was won by Messrs. Prior & Sons.

There was excellent competition in the amateurs' classes. The best eighteen distinct Roses were staged by Rev. J. H. Pemberton, Havering, Romford, who had fresh and good blooms of Her Majesty (very large), Lady Hill, Marie Baumann, Marquise de Castellane, Sir Rowland Hill, T. W. Girdlestone, Mrs. J. Laing, Madame Victor Verdier, Anna Ollivier, Comtesse d'Oxford, Prince Arthur, H. Schultheis, Charles Lefebvre, Etienne Levet, and E. Y. Teas. Mr. E. N. Bunn was second. In the class for twelve blooms there was good competition, Mr. Orpen securing first honours with Madame de Watteville, Charles Lefebvre, Maréchal Niel, Marie Baumann, Françoise Kruger, Innocente Pirola, La France, Climbing Captain Christy, Madame G. Luizet, Catherine Mermet, Princess of Wales, and Marie Van Houtte. Mr. J. Gurney Fowler was an extremely close second, and Mr. E. N. Bunn third. Mr. Pemberton won two special prizes in classes for six blooms, and Mr. Orpen secured the silver medal of the N.R.S. for the best bloom in the amateurs' classes with a wonderfully fine example of The Bride. He therefore won both the medals with Tea Roses. Some neat blooms were exhibited in the local amateurs' classes, but the staging was in many cases open to improvement.

It can only be said generally of the other sections of the Show that herbaceous flowers were well represented, Mr. R. C. Noteutt, Broughton Road Nursery, Ipswich, having a very fine collection; that table-decoration and bouquets made an admirable display, also that trusses of Zonal Pelargoniums were very good indeed. In the plant classes Lord Rendlesham's gardener exhibited well-grown Orchids, while Tuberous Begonias and Gloxinias were very good, but the groups of plants were too formal and crowded as a rule. Of small fruits, especially Strawberries, there was an extensive and admirable display. Vegetables of the first quality were staged, especially in competition for Messrs. Carter's and Sutton's prizes, and it may be said that all kinds were well represented in the several tents. The schedule contained 170 classes.

Mr. J. Andrews is the zealous Secretary of this evidently well managed Society, and he was ably assisted at the Show by Mr. W. Brinkley, the Honorary Assistant Secretary. Probably the Judge who was labouring under the geographical difficulties above indicated will be able to find his way to Woodbridge if he should happen to be commanded again.

WINDSOR.—JULY 7TH.

THE Windsor and District Rose Society is a new association. It owes its existence to Mr. C. Romaine, The Priory, Old Windsor, who, on being appointed local Secretary by the National Rose Society, bethought him that he might do a little more for Roses than the duties of that post entailed by founding a new body. It is meet that in the Royal borough there should be a special society devoted to the Royal flower, and Mr. Romaine's happy idea was taken up energetically. H.R.H. the Princess Christian headed an influential list of lady patronesses, the Rev. the Marquis of Normanby consented to become President, and a number of practical officials were appointed, the Committee consisting of Messrs. D. Challis, H. Godfrey, Guttridge, J. Lindsay, A. Sturt, H. Tomlinson, and A. Turner of Slough; Mr. E. F. Gribble acting as Treasurer, and Mr. Romaine as Secretary. All things being thus put into working order, it was decided to hold a Show this season, in order to give the new body a *raison d'être*, and to show that it was marking out for itself a career of usefulness. The opening Exhibition was held in the Albert Institute on the above date, and though a spacious hall was devoted to the Show it proved none too large for the occasion. Those connected with the Society have reason to be gratified with the first result of their labours, for the Show was an excellent one as a preliminary display, and it may be hoped that it will prove to be the forerunner of a long list of successes. The Exhibition was held under the rules of the N.R.S., with which body the Society is affiliated.

The Princess Christian visited the Show at 4 P.M., being conducted round by Mr. Romaine, and accepting a bouquet of Roses from Miss Romaine. The attendance was good throughout, and though the accounts were not made out at the time of our report being prepared, there will be a surplus to be carried forward.

The principal nurserymen's class was that for thirty-six blooms, distinct, single trusses, and in this there were three stands. The best was that from Mr. G. Prince, who could claim the not very common pleasure of defeating Mr. Frank Cant in the leading class, but to all appearances the latter's flowers had done service elsewhere. They were certainly past their best. Mr. Prince had lighter but much fresher flowers, the varieties being Alfred Colomb, Comtesse de Nadaillac, Exposition de Brie, Souvenir de S. A. Prince, Gustave Piganeau (very good), Lady Mary Fitzwilliam, A. K. Williams, The Bride, Sir Rowland Hill, Innocente Pirola, Prince Arthur, Catherine Mermet, Earl of Dufferin, Victor Verdier, Victor Hugo, Captain Christy, Fisher Holmes, Princess of Wales, Louis Van Houtte, Madame de Watteville, Beauty of Waltham, Niphotos, Xavier Olibo, Germaine Caillot, Sénateur Vaisse, Maréchal Niel, Prince Camille de Rohan, Jeannie Dickson (good), Chas. Lefebvre, Souvenir d'Elise Vardon, Horace Vernet, Etienne Levet, Merveille de Lyon, Madame C. Wood (very fine), Duchess of Bedford, and Mrs. John Laing. Mr. E. F. Sueh was third. Mr. Frank Cant won with eighteen Teas and Noisettes, being much more like himself in this than in the other class. His blooms were in beautiful condition, and won easily. The varieties were Niphotos, Madame Cusin, Hon. Edith Gifford, Souvenir d'un Ami, Innocente Pirola, Madame de Watteville, The Bride, Princess of Wales, Louis Van Houtte, Comtesse de Nadaillac, Maréchal Niel, Ernest Metz, Cleopatra, Souvenir de Paul Neyron, Souvenir de S. A. Prince, Madame Hoste, Ethel Brownlow, and Rubens. Mr. Prince was second, and though his flowers were neither so large nor so fresh as Mr. Cant's, they were very good.

In the principal amateurs' class T. W. Girdlestone, Esq., Sunningdale, won by many points. Eighteen blooms were asked for, and very bright well coloured examples of Louis Van Houtte, Souvenir d'Elise Vardon, Duke of Edinburgh, The Bride, Dupuy Jamain, Madame G. Luizet, Charles Lefebvre, Madame Bravy, Général Jacqueminot, Baroness Rothschild, A. K. Williams, Souvenir de S. A. Prince, Prince Arthur, La France, Ulrich Brunner, Merveille de Lyon, Gloire de Bourg la Reine, and Marquise de Castellane, gained him the award. Mr. C. Romaine (gardener, Mr. Guttridge) was second with much smaller but fresh flowers; and F. W. Flight, Esq. (gardener, Mr. W. Neville), third. C. J. Grahame, Esq., won with six of any variety, staging a good half dozen of Innocente Pirola; T. T. Strange, Esq., being second with Baroness Rothschild, and Mr. Girdlestone third with Hon. Edith Gifford. There was a very close contest between Mr. Girdlestone and Mr. Grahame with twelve Teas and Noisettes in not less than eight varieties, the former eventually winning. These were both extremely beautiful boxes. Mr. Girdlestone had a splendid bloom of Souvenir d'Elise Vardon in his stand. Mr. Romaine was third with somewhat small, but very fresh, neat flowers.

The local classes were well filled. In the principal one for eighteen blooms Mr. Grayer, gardener to the Duchess of Sutherland, won easily with fresh bright flowers, Etienne Levet being very good indeed. Mr. Sturt, gardener to N. L. Cohen, Esq., was second, and Mr. Popple, gardener to the Hon. Lady Stepney, third. These were both two flat. The silver medal of the N.R.S. for the best bloom in the local classes was awarded to Mr. J. Jones, gardener to Miss Davy, for a good Her Majesty. T. W. Wix, Esq., was first with twelve, Messrs. Paxton, gardener to the Hon. C. Irby, second, and Mr. Vince, gardener to F. Drummond, Esq., third. Mr. A. Briginshaw won with six, Messrs. Hargreaves and Vyse following. In other classes Messrs. Vince, Sturt,

Jones, Popple, Tindall, Hargreaves, and Grayce won prizes. The prizes for baskets went to Misses Curll, Romaine, and Mary Taylor.

The N.R.S. medal for the best Rose in the open classes went to Mr. Girdlestone for the fine Souvenir d'Elise before referred to, and which had also been selected as the premier flower are Bagshot the day before. Mr. Grahame's Innocente Pirola, which won the medal at Croydon on the previous day, was its chief rival. It was a splendid bloom, but a little past its best.

Messrs. J. Laing & Son had a collection of hardy flowers and a brilliant display of Begonias, Orchids, Caladiums, and other flowering and foliage plants, which were greatly admired. Mr. J. Smith sent Ferns, Messrs. Cutbush & Son sent a beautiful group of hardy flowers, in which *Campanula pelviformis*, *C. macrantha*, *C. persicifolia nitida*, *C. latifolia*, *Achillea Millefolium rosea*, *Centaurea macrocephala*, and *Eryngium amethystinum* were noteworthy amongst others. Mr. C. Turner exhibited a magnificent group of his superb Pelargoniums, Show and Fancy, also many boxes of Roses, the whole producing a brilliant effect. Mr. Titt showed floral decorations, and Messrs. G. Jackson & Son had a beautiful display of Roses.

REIGATE.—JULY 9TH.

ALTHOUGH the weather was somewhat threatening at times rain did not interfere with the enjoyment of those who had assembled to inspect the Rose Show in Mr. T. B. Haywood's beautiful garden at Woodhatch on the above date. A more compact and enjoyable Exhibition, or one held under more delightful surroundings, it would be difficult to imagine. If any exhibitor not quite in the front rank entered under the expectation of finding a quiet corner and returning home laden with prize money he must have received a rude re-awakening, for the southern giants were there almost to a man, and what is more, they were showing in their finest condition. Mr. Frank Cant, continuing his phenomenally successful career this season, almost swept the board in the open classes, staging magnificent blooms. His Suzanne Marie Rodocanachi in the first prize stand of forty-eight was a wonderful example, the brilliant and glowing colour being beautifully brought out, combined with great size and fine form. Superb, too, were Mr. Lindsell's flowers. A stand of greater proportionate merit than his winning eighteen has not been exhibited for many years. Dr. Budd was most unfortunate in having to meet so entirely exceptional a box, for he had some beautiful flowers, and is clearly making marked improvement.

The principal class was that for forty-eight varieties, and Mr. Frank Cant added another to his long list of victories, winning with a very beautiful stand. His flowers were large, full in colour and in admirable condition. The varieties represented were Her Majesty (a fine bloom), Marie Baumann, John Hopper, Alfred Colomb, Lady Mary Fitzwilliam, Lady Helen Stewart, Souvenir d'Elise Vardon, Pride of Reigate, Heinrich Schultheis, Mrs. Harry Turner (very good), Madame de Watteville, Duke of Teek, Souvenir de S. A. Prince, Dupuy Jamain, Ernest Metz (a beautiful flower), Duke of Edinburgh, Souvenir d'un Ami, Prince Arthur, Germaine Caillot, Dr. Andry, Madame Cusin, Chas. Lefebvre, Mrs. John Laing, Marie Rady, Comte de Raimbaud, Chas. Darwin, Merveille de Lyon, Gustave Piganeau, Comtesse de Nadaillac, Duke of Wellington, Caroline Kuster, Suzanne Marie Rodocanachi (a magnificent flower), The Bride, Comtesse d'Oxford, Catherine Mermet, Earl of Dufferin, Niphetos, Star of Waltham, Baroness Rothschild, Horace Vernet, Madame Lambard, Sultan of Zanzibar, Margaret Dickson, Chas. Lamb, Marie Verdier, A. K. Williams, Cleopatra and François Louvat. Many points behind, but still with a very good stand, came Mr. B. R. Cant. His flowers were very even in merit, perhaps the best being a lovely bloom of Ethel Brownlow, one of the best flowers in the show. Messrs. G. Paul & Son were third with small but neat and fresh examples.

For twenty-four varieties Mr. Salter, gardener to T. B. Haywood, Esq., was a good first. He had very fine blooms of Marguerite de St. Amand, Général Jacqueminot, Countess of Rosebery, and Countess of Oxford, but all were very good. The Rev. J. H. Pemberton was second with a lighter stand, in which Her Majesty, Horace Vernet, and Duchess of Bedford were the most conspicuous. Mr. Brown, gardener to Mrs. Waterlow, was third, with Her Majesty and Etienne Levet very good.

Teas and Noisettes were very finely shown by Mr. Frank Cant, who was first in the class for eighteen varieties with Ernest Metz, Souvenir d'Elise Vardon, Innocente Pirola, Madame Hoste, Anna Ollivier, The Bride, Madame Cusin, Maréchal Niel, Catherine Mermet, Niphetos, Ethel Brownlow, Jean Ducher, Madame de Watteville, Comtesse de Nadaillac, the Hon. Edith Gifford, Madame H. Jamain, Caroline Kuster, and a very fine Souvenir de S. A. Prince. Mr. G. Prince was a close second with neat fresh blooms, though somewhat undersized, and Mr. B. R. Cant third. Mr. Frank Cant scored yet another victory with trebles, having very heavy and fresh blooms. Her Majesty, Suzanne Marie Rodocanachi, Marie Baumann, and Alfred Colomb were all excellent. Mr. B. R. Cant came second with smaller flowers, and Messrs. Prior & Sons third.

There were some superb blooms in the amateurs' division. Mr. E. B. Lindsell had a magnificent stand of eighteen varieties, the blooms being of great size and perfectly fresh. The varieties were Marie Baumann, La France, Abel Carrière, Caroline Kuster, Gustave Piganeau, Mrs. J. Laing, Horace Vernet (very fine), Ulrich Brunner, Dr. Sewell, Catherine Mermet, Earl of Dufferin, Her Majesty (very fine), Madame V. Verdier, Niphetos, Dupuy Jamain, Marie Verdier, Duke of Edinburgh, and Suzanne Marie Rodocanachi. There have been few finer stands shown than this. Mr. S. P. Budd was second, also with a strong stand, but far behind Mr. Lindsell's; Alfred Dumesnil, Mrs. John Laing, Her Majesty,

and Comte de Raimbaud were the best blooms. Mr. A. Tate was a highly creditable third. Mr. Budd had the best of several fine stands of six trebles, his flowers being in every respect admirable. Mr. Tate was second, and Mr. Lindsell third. With twelve of one variety the latter won, showing a very neat stand of Caroline Kuster. Mr. H. M. Bethune was second with Madame Gabriel Luizet, and Mr. A. Slaughter third with Alfred Colomb.

Teas were splendidly shown by Mr. Lindsell. He had an exceptionally beautiful stand of twelve, the varieties being Innocente Pirola, Jean Ducher, Caroline Kuster, Madame Cusin, Niphetos, Catherine Mermet, The Bride, Marie Van Houtte, Etoile de Lyon, Madame Margottin, Souvenir de S. A. Prince, and Comtesse de Nadaillac. Mr. Budd followed, also with a charming stand, and Mr. T. W. Girdlestone was third, the Rev. A. Foster Melliar being commended.

In the third division there were also good blooms, and plenty of competition. The Rev. H. A. Berners won with twelve, Mr. Gurney Fowler being second, and Mr. O. G. Orpen third. Mr. Berners also won with four trebles, Mr. C. E. Cuthell second, and Mr. E. Mawley third. Mr. Orpen had a delightful stand of nine Teas, and scored a highly meritorious win, Mr. Berners being second, and Mr. P. G. C. Burnand third. Mr. H. Shoesmith, gardener to M. Hodgson, Esq., won with six blooms, Mr. J. De la Mare second, and Mr. W. D. Freshfield third; the latter won with six Teas, Messrs. Shoesmith and J. De la Mare following. A neat stand of Marie Van Houtte won Mr. Burnand the first prize for nine blooms of one variety, Mr. Cuthell being second with Marie Van Houtte, and Mr. Berners third with Eclair. Miss Watney received the first prize for table decorations, Iceland Poppies being the only flowers utilised. Miss Beatrice Lorent was second, and several others were commended. Miss Horne had the best basket of Roses, and Miss Nicholson the second best. Garden Roses, as shown by Messrs. Tate and Girdlestone, were delightful. The exhibitors named were placed equal first. Messrs. Cheal & Son and Messrs. J. Peed & Son had beautiful miscellaneous displays.

WOLVERHAMPTON.—JULY 12TH, 13TH, AND 14TH.

A GREAT Show opened at Wolverhampton on Tuesday, of which Roses, perhaps, formed the chief feature. The display was a magnificent one, certainly the best of the season up to date. Only the names of the winners in the chief classes, or such of them as could be obtained at the moment, can be given, and are as follows:—

In the open class for seventy-two Mr. B. R. Cant won with magnificent blooms, combining weight, freshness, and form in a remarkable manner. Mr. Frank Cant was second with beautiful stands, but the blooms as a whole a trifle smaller. Messrs. Harkness & Sons, Bedale, were third with somewhat smaller but almost brighter examples.

In the open class for forty-eight blooms Mr. B. R. Cant was again first; Messrs. Prior & Sons, Colchester, second; Messrs. Cooling and Sons, Bath, third; and Mr. Merryweather, Southwell, fourth, all staging blooms of very high quality in a splendid competition. In the open class for thirty-six blooms, the Rev. J. H. Pemberton, Havering, was first with delightfully fresh examples in admirable colour; Mr. Frank Cant, second; Messrs. Perkins & Sons, Coventry, third; and Mr. B. R. Cant fourth.

Mr. B. R. Cant was first with twenty-four blooms, Messrs. Prior and Son second, and Messrs. Cooling & Sons third. In the class for twelve Teas the prizes were adjudged to Messrs. B. R. Cant, Prior and Son, and Merryweather in the order of their names.

In the twelve dark blooms class Messrs. Cooling & Sons were first with A. K. Williams, Messrs. Prior & Son second with Horace Vernet, and Mr. B. R. Cant third with Gustave Piganeau. In the light class Messrs. Alex. Dickson & Sons were first with Margaret Dickson (splendid blooms), Messrs. Prior & Son second with Mrs. Laing, and Mr. B. R. Cant third with Ernest Metz.

Messrs. Alex. Dickson & Sons exhibited twelve blooms of a new Rose, Mrs. W. J. Grant, deep rose with broad, smooth, shell-like petals, deepening to salmon at the base. It is a Rose of promise, and a first-class certificate was awarded.

It may be added that in the class for ten dishes of fruit Mr. McIndoe was first, Mr. Bannerman a close second, and Mr. Edwards third. Mr. Bannerman was first in the class for six dishes, his Black Hamburgh Grapes being very fine indeed. Certificates were granted to Mr. W. Allan for Lord Suffield and Gunton Park Strawberries. Further reference will be made to this extensive provincial Exhibition another week. The Mayor of the town is the President of the Society, and Mr. W. A. Green, jun., the indefatigable Secretary.

FRUIT FORCING.

Vines.—*Vines in Pots.*—Those intended for early forcing—that is, to be started the first week in November for ripening the fruit in March or early April, should by this time have completed their growth, and must not have any more water than will prevent the foliage from becoming limp. Expose fully to light and sun, so as to thoroughly

ripen the wood and the buds. If the laterals have been allowed to extend with a view of thickening the cane, they must be brought back gradually by cutting away part at a time, reducing each by degrees to one leaf. The Vines should be kept free from insects, syringing occasionally if red spider appear, for it is important that the leaves should perform their functions. When the wood becomes brown and hard place the Vines on a board or slates in front of a south wall, securing the canes to its surface to prevent the foliage being damaged by wind. Afford water only to prevent the leaves flagging; cut away the laterals close to the cane, and in a few days shorten the cane to the length required. The principal leaves must not be injured, but left to die off naturally. The best varieties for early forcing are White Frontignan, Foster's Seedling, Black Hamburgh, and Madresfield Court. Later plants should be encouraged to perfect a good growth, keeping them clean, also exposed to all the light and sun possible. They must not be over-watered, nor neglected for due supplies of water or liquid manure. Cut-backs are much the best for early forcing, as the Vines make an earlier and sturdier growth, and perfect it sooner than others. This is important, for the Vines have more rest, and start with greater regularity.

Early Forced Planted-out Vines.—It is not desirable to force Vines year after year to ripen their crops before May or June, and houses which are started in December or at the new year to afford ripe fruit at the times mentioned are best planted with varieties that ripen together, the houses being of sufficient size only to admit of a supply of Grapes for the establishment for a period of not more than six to eight weeks. That is as long as black Grapes will hang on the Vines under a June and July sun without turning red, or white Grapes keep from becoming brown on the exposed side of the bunches, even when a slight shade is afforded from sun. Such an arrangement admits of the foliage being cleansed with water from a syringe or engine, but in a house planted with White Frontignan, Foster's Seedling, Buckland Sweetwater (not satisfactory when continuously early forced), Mill Hill Hamburgh, Black Hamburgh, and Madresfield Court, to ripen their crops in May, Muscat of Alexandria in June, and Gros Colman with Trebbiano in July, the warm and comparatively dry atmosphere, consequent on the constant ventilation essential to ripen the fruit of the early varieties, causes red spider to increase upon the foliage of the Muscats and other late sorts before they are ripe, whilst the foliage of the early varieties is almost all gone by the time the late sorts have the Grapes fit for table. This is most disastrous to present and future crops of Grapes, indeed mixed collections of Grapes are not satisfactory. It is far better to divide a large house into two or three compartments, so that the respective kinds may have their proper treatment. Early Vines that ripened their crops in May or early June will soon be cleared of Grapes. They should then be thoroughly cleansed, employing an insecticide if necessary, and the foliage preserved in health as long as practicable by occasional syringing, removal of the roof lights in showery weather, full ventilation constantly, and due supplies of water or liquid manure at the roots.

Muscats Ripening.—Unless the season is exceptionally fine and the Vines started early Muscats require fire heat to insure their perfect maturation, even when ripening at the hottest part of the year. The time taken by Muscats to ripen is never less than eight or nine weeks from commencing to colour, and if the Grapes are extra fine and the Vines vigorous perfect finish is not generally had under three months. They require time and assistance from fire heat, so as to secure a night temperature of 70° to 75°, 85° to 90° by day, with abundance of air. A rather dry atmosphere is essential to the attainment of that golden hue characteristic of rich and full Muscat flavour. This is secured by free ventilation, a little constantly, but the atmosphere must not become arid, damping down occasionally. In large houses the moisture arising from the borders is enough, except in hot weather, then the available surfaces in the house should be damped daily. Too much atmospheric moisture is fatal to Muscats when ripening, causing them to "spot," therefore it is necessary to have a gentle warmth in the hot-water pipes, and a little air constantly to prevent the deposition of moisture on the berries. Abundant supplies of water must be given at the roots, for when there is a deficiency of moisture the Grapes shrivel. With the borders properly constructed and the drainage thorough too much water can hardly be given at the roots after the leaves are full sized until the Grapes are well advanced in ripening. Needless waterings, however, are baneful, and dribblets—mere damping of the surface—very ineffective, doing quite as much harm as good.

Young Vines.—Those planted this season should, provided they are to be cut back to the bottom of trellis, or to two or three buds at the winter pruning, be allowed to grow unchecked, so as to secure a good root formation and sturdy stems. Any Vines intended for next year's fruiting should have the laterals issuing from the side of the buds to which they are to be shortened, stopped to one leaf, and the principal leaves kept free of growths. If permanent Vines the cane need not be stopped until it has grown to the top of the house, shortening it at the winter pruning to three good buds from the bottom of the rafter or trellis, and only allowing each Vine to bear a bunch of Grapes in the second year to prove the variety. Supernumeraries intended for next year's bearing should be stopped at a length of 7 or 8 feet, pinching the laterals to one leaf, and sub-laterals in like manner. These should be shortened in September, and by degrees cut away close to the cane, and in a fortnight afterwards the Vines should be pruned to the first plump bud below the first stopping, leaving the old leaves to die off naturally. Thorough ripening of the wood is important, a free circulation of air being necessary, with fire heat if the weather be cold and wet.

Melons.—Stopping and Removing Growths.—The plants grow rapidly when the weather is moist and warm, and should be gone over once a week at least, and in the case of vigorous plants twice, for stopping and removal of superfluous shoots, the principal leaves being fully exposed to light. Overcrowding is the greatest evil in Melon culture, because the excessive foliage must be thinned, and its removal results in exudation from the wounds, gangrene sets in, and the affected parts perish through "wet rot" (bacteria and bacillus growths). To arrest these antiseptics must be used. The safest is quicklime, rubbing it well into the affected parts, and repeating as necessary. But the worst effect of removing a large quantity of growth is giving a check to the fruit, not unfrequently causing it to cease swelling, and it becomes hard in the flesh. Fungoid germs fasten upon the exudation, and the fruit decays when it should ripen. These disasters are generally preventable by attending to the thinning and stopping of the growths. Therefore, when the fruit is set and has swelled to the size of an egg, the laterals should be pinched to one leaf, and if this results in too much foliage, so that the leaves upon the primary shoots are crowded or shaded by them, thinning must be resorted to, removing a little at a time.

Watering.—This is very important in Melon culture. If the plants are kept too dry a check has been given which will cause them to collapse before the fruit is fully developed, and that ripens prematurely. The great point is not to allow flagging at any time, and yet not to give water until the soil is getting rather dry, when a thorough supply should be given. Plants with a large extent of rooting space need water or liquid manure once a week, those with lessened rooting areas twice a week, and those in pots or boxes once or twice a day. Regard must be had to the weather and the actual needs of the plants. When setting and ripening it will be sufficient to just keep the foliage from flagging, and if watering is necessary it should be given without wetting the surface more than can be avoided.

Damping and Syringing.—At the time of setting and ripening moisture must not be entirely withheld from the atmosphere, but available surfaces may be damped in the morning and early afternoon, or occasionally only in not very bright weather. When the blossoms are about expanding withhold water from the foliage, and when the fruit is ripening it must not be wetted nor a close moist atmosphere kept, as those are fatal to flavour, and often the cause of the fruit cracking. With the fruit swelling syringe well at closing time, and if morning syringing is practised it should be done early, but the liberal damping of available surfaces is better than wetting the foliage. Plants in frames should be sprinkled overhead at closing time, being careful to keep the water from the neck or collar of the plants.

Temperature.—In most cases fire heat is not now required, as with due regard to early closing the night temperature may be kept from falling below 65°. In dull periods, however, a little fire heat may be desirable to maintain a buoyant atmosphere when the fruit is setting or ripening. Plants in frames at those times are better for linings, so as to allow of a circulation of air, otherwise the temperature will be ruled by external conditions, yet it ought to be maintained at 65° at night and 70° to 75° by day.

Ventilating.—It is a good plan to leave a little air on at night in all cases, and increase it early in the morning of fine days when the temperature has advanced to 75°, and gradually increase it with the rising heat, keeping through the day at 80° to 90°, and closing sufficiently early to rise to 95° or 100°, and before nightfall admit a crack of air at the top of the house. When the fruit is ripening admit air freely, also when setting, leaving a little on constantly to prevent the deposition of moisture on the fruit or blossoms through the night.

Routine.—Put supports to the fruit before they get heavy, letting the board slant so as not to hold water. Place slates beneath the fruits of plants in frames, raising them as the Melons advance in swelling on inverted flower pots above the foliage. After a period of dull weather it is desirable to afford a slight shade for a few hours in the hottest part of the day to prevent the foliage flagging and tender fruit from being scorched. A slight shade is useful over fruit in the ripening stage when it is exposed directly to the sun, especially when the plants do not, from indifferent vigour, supply moisture to the fruit freely.

Insects.—Black aphids sometimes becomes troublesome. The best remedy is fumigation with tobacco paper on two or three consecutive evenings, taking care to have the foliage dry and to deliver the smoke cool. Avoid an overdose, and mat up frames to keep in the smoke. The Lethorion Vapour Cone kills red spider, even mealy bug, and "unfixed" scale without any damage to the tenderest foliage, but these pests never ought to be present in well managed Melon houses or frames. Thrips yield to tobacco smoke. Canker is caused by damp in many cases, but it is inherent in some varieties. It is averted by a drier atmosphere or freer ventilation, and rubbing quicklime into the affected parts until dry, repeating if necessary. By those means the plants can generally be kept alive until the crop is perfected.

THE KITCHEN GARDEN.

Asparagus.—Where at all exposed to gales of wind the strong growths of Asparagus are liable to be blown down and either dislocated at the junction with the roots or badly fractured. In either case their function, viz., forming strong buds, is greatly interfered with, and as a consequence the young shoots next season will not be nearly so large as they would otherwise have been. Those planted widely apart, whether on the level or in raised beds, are the most likely to be damaged, and these, at any rate, ought to be supported by stakes. Hand-weeding

between the Asparagus generally should be frequently resorted to, thereby saving much future labour. Allowing weeds to seed in these positions is most unwise. If salt is applied to Asparagus on heavy soils it should be done in the summer just in advance of a rainfall, and a light surfacing of this fertiliser may with advantage be given in the case of any on lighter soils, and which may have had a spring dressing. Other manures, notably guano, applied now and washed in by rains or the hose would also be most beneficial. Removing the seed, which forms only too freely in some instances, is tedious, but is considered beneficial, especially to weakly plants. It is a mistake, though, to cut out seeding growths if at all numerous, as in this case there may be but few other growths to form the buds that are to produce stronger shoots next spring.

Beans.—It rarely pays to sow Broad Beans in July, but if particularly desired there is no good reason why a row or rows each of Beck's Dwarf Green Gem and Early Longpod should not be sown. The former, being of low branching growth, is well adapted for warm borders, and can be readily protected if necessary. Kidney Beans are not greatly in demand while Runner Beans are plentiful, but a late sowing may give some very acceptable dishes in September. These may well follow Potatoes, Cauliflowers, Lettuces, or other early crops on sheltered sunny borders. Sow Canadian Wonder now thinly, in rows 2 feet apart, and Sion House or Ne Plus Ultra later in the month, a distance of 18 inches apart being enough for these. Any Kidney Beans that are to give a crop of ripe seed should be kept clear of the ground by means of Hazel or other spray. It is advisable to thin out the plants freely, leaving them 12 inches apart, also staking them when long straight exhibition pods are required. Overcrowding Runner Beans is a common error, but one that ought to be avoided. One plant to a pole is ample, and these ought to be fully 12 inches apart in the rows. For a time they require attendance in the shape of regulating and making the growths secure, and later on, or when the tops of the poles are reached, pinch out the points of the leaders, thereby preventing their becoming top-heavy—stopping the leaders also greatly strengthening and improving the productiveness of the lower part of the haulm. Those grown entirely without stakes should have all running growths kept closely snipped out. Runner Beans must have plenty of moisture at the roots, liquid manure also being most beneficial. Do not allow large numbers of old pods to hang, as they have a most weakening effect on the plants. If exhibition pods are required thin out freely, selecting and reserving the best shaped pods, and feed well at the roots.

Cabbage.—About the middle of July is rightly considered the best time to make a first sowing of that excellent Cabbage, Ellam's Dwarf Spring, and there are other varieties that also succeed well if sown thus early. It is not advisable to rely solely upon one sowing, the better plan being to divide the packets and sow again a fortnight or three weeks hence. The plants ought to be raised thinly so as to avoid any necessity for pricking out, and well in the open in order that they may be very sturdy. The ground should be got into a perfectly fine condition, and if at all dry a good overnight watering would greatly facilitate the work of forcing down the lumps. If shallow drills are opened 4 inches apart, gently moisten them and then sow the seed thinly, covering with fine soil. The plan of sowing broadcast has much to recommend it, but it is a mistake to attempt raking in the seed. Instead of this sow the seed thinly on the surface of well moistened ground, and then lightly cover with sifted soil. Net over in order to keep birds away and protect the young plants from slugs and fleas by means of occasional dustings with soot and lime.

Endive.—That early sown is almost certain to run to seed prematurely, but such is not often the case with the plants obtained by sowing early in July. By that time a good breadth of early Potatoes are lifted in most fairly warm districts. If a portion of the ground thus cleared can be devoted to Endive no better site can be found. Advantage ought to have been taken of a showery time to get the ground into a finely divided state, and the seed can then be sown at any time. Should the intended seed bed be hard, dry, and lumpy well water it overnight and it will crumble to pieces readily the next morning. A good form of Green Curled and the Broad-leaved Batavian are all the varieties that need be sown, the latter being the latest and much the best for winter use. Large seed beds are desirable, and then if a portion of the plants are left undisturbed these will be the first ready for use. Sow thinly in drills 6 inches apart or broadcast, and cover with sifted soil. Any raised earlier ought to be lightly thinned out where at all crowded, and when large enough to transplant give a good watering if at all dry, and also well moisten the intended site prior to pulling out the plants. They will require to be frequently watered during dry hot weather, and it will much simplify matters to plant in rather wide drills. The Moss Curled may be put out 6 inches apart each way, but the Green Curled forms should be arranged 9 inches apart in rows 12 inches apart.

Late Peas.—If newly saved seed or good old seed of either William I., Chelsea Gem, William Hurst, or English Wonder is sown about the middle of July there is every likelihood of a few serviceable late dishes being had. Sometimes or in some gardens sowings made as late as the end of July pay well for the trouble taken with them, and in warm localities Omega, sturdy and other late varieties sown at the present time do good service. Sow the dwarf varieties mentioned on a warm border in rows 18 inches apart or on the Celery ridges, and they can be readily protected from early frosts, frequently succeeding surprisingly well.

PLANT HOUSES.

Crotons.—Pot all free-growing plants that are well furnished at the base into 7 and 8-inch pots, or even into larger if plants in these sizes

can be employed for furnishing. Plants that have become too tall may have their heads re-rooted, so that well coloured side shoots will be produced for striking later in the season. Where quantities of decorative plants with ornamental foliage are needed in rooms during the winter months too many Crotons in various sizes cannot well be produced. We have always a good stock of highly coloured plants in 2 and 3-inch pots, which are most useful for association with Ferns, Mosses, and other dwarf growing plants. Do not shade the plants, but expose them fully to the sun, so that their rich colours can be developed. Syringe them liberally, and close the house early in the afternoon. Give a little artificial manure to the surface of those that it is necessary to keep in certain sizes when they are full of roots.

Dracænas.—Where plants are becoming too large and have lost their lower leaves the stems may be cut and mossed. In a close moist atmosphere they throw out roots quickly, and may be taken off with good balls, and placed at once in 6 and 7-inch pots, according to the variety. If placed in the shade for a fortnight good well-furnished plants are again produced. Where narrow leaved kinds are appreciated for table decoration *superba* is one of the best. To have really good plants those raised from portions of the stem need to be grown strongly, and the top re-rooted before plants can be had in their best condition. The same remark applies to *Guilfoylei*, and when well grown it is a very handsome table plant. To colour these plants highly they must be exposed to plenty of light, but this must not be overdone, or their foliage becomes too highly coloured, and is liable to go bad at the points. Young stock raised from portions of stem this spring and well established in 3 and 4-inch pots should be placed into larger ones. It is a great mistake to allow plants that it is intended to grow on to become root-bound before they are repotted. Plants checked by this cause seldom do any good afterwards. These plants need careful watering for a time after potting until they are rooting freely in the new soil. The same treatment should be given to green varieties that can be grown in a lower temperature; but if well-developed plants are needed as soon as possible they may be grown in heat during their early stages, or until they are large enough for the purpose for which they are required. *Dracænas* do well in equal parts of fibry loam and leaf mould, with one-seventh of manure and a liberal quantity of coarse sand. Peat may be substituted for the leaf mould if plentiful.

Ixoras.—Plants that have flowered may have their shoots slightly shortened back. Well shorten those that have failed to flower. The plants should be thoroughly cleaned if they need it, and then started again into growth in brisk heat. They will come into flower again, and be useful towards autumn. Shoots that have not flowered may be inserted in small pots, and rooted in brisk heat in the propagating frame. These will make useful plants for flowering early next year in 4 and 5-inch pots.

Allamandas.—Plants growing in pots will have filled them with roots by this time. If they are to continue producing the largest size flowers a liberal top-dressing of manure must be given them, the roots will soon take full possession of it. Liquid manure may also be given in a weak state every time the plants need water. Do not allow them to become dry; the object should be to keep them growing, then they will continue to flower. Do not shade the plants, but grow them fully exposed to the sun. The reason these plants make vigorous growth, and often fail to flower profusely, is due to overshadowing.

Stephanotis floribunda.—Plants that have been trained upon trellises and have done flowering should be taken off and cleaned. If they are to flower well another year train the growths under the roof of a light house, where they will be fully exposed to the sun, and where air can be given freely until September. In this position the wood will become thoroughly ripened, and the plants will flower well another year. If kept closely trained upon trellises the whole season the wood has but a poor chance of being well ripened. Plants that are growing freely may have weak stimulants every time water is needed if the pots in which they are growing are full of roots. If mealy bug exists upon the plants syringe them occasionally with petroleum and water, 3 ozs. of oil to four gallons of water. Shade for a few days afterwards until the oil has been evaporated.

Clerodendron fallax.—Plants raised from seed and well established in small pots may be placed into 5 and 6-inch. Once they are fairly established in these pots and have been gradually hardened they will do in cold frames, providing they are kept close and closed early in the afternoon, so as to run up the temperature.

Asparagus plumosus.—Young plants raised from cuttings and well established in thumbs may be placed into 4-inch pots. In this size they will make bushy little plants. Those in 4-inch pots may be placed into 6-inch. This variety in small pots is very useful for decoration, especially for grouping with other plants in large conservatories.

Fittonias.—A good stock of these may be raised in small pots. They are useful during the winter. When once they are rooted they will grow freely under the shade of Crotons, *Dracænas*, and other plants where it is warm and moist.

Panicum variegatum.—Well furnished plants in 4 and 5-inch pots are always useful where furnishing is carried out on a large scale. A number of pots should be made up at once by inserting cuttings thickly into the sizes required. They root readily in any warm, moist, shady place.

TRADE CATALOGUE RECEIVED.

Messrs. Dammann & Co., San Giovanni a Teduccio, near Naples, Italy.—*Bulbs, Roots, and Orchids.*

THE BEE-KEEPER.

APIARIAN NOTES.

A SECOND swarm issued from a Punic stock five days after the first one, and took along with it perhaps a score of queens, being about a tenth of what were in the parent stock. These surplus queens of the second swarm distributed themselves freely amongst my other stocks, and I picked out about a dozen queens after from it. I then sprayed the bees well with thin syrup till they were well gorged, and with an iron spoon, and sometimes in handfuls in front of some half dozen Carniolan nuclei, and not a bee was killed. The queens that took refuge in other hives, with one exception, were all killed by the bees. The one in which the queen was preserved had a royal cell of its own, and, in addition to the one Punic retained, two others were killed. It is a valuable lesson to all bee-keepers.

TO PREVENT AFTER SWARMS.

I have for many years taught and practised this system. Some of your readers will remember my recorded experience some eight years ago with Cyprians. Punics, Cyprians, and Syrians raise an excessive number of queens, and so do other varieties, but not to the same extent. Still all after swarms of any and every variety have at times an excess of queens, and all are alike liable to enter other hives. Sometimes they are killed, while at others they are allowed to live, and in one case it was not thrown out of the hive for several months after. Then, again, whether the hive has queen cells only, or a regnant queen, with the hive partly full of bees and combs, a swarm will issue, to the great annoyance of the bee-keeper. Such erratic movements have occurred frequently in my apiary.

RETURNING AFTER CASTS.

Do not suppose that the returning of after swarms immediately after they have been secured, or allowing them to stand close to the parent hive till next morning, and uniting the swarm to it, will stop swarming. It may please a novice, but in most cases the hive will send off one or more swarms. Bees jealously guard their royal cells, and when this is going on detachments are formed, which create the frenzy characteristic of bees at swarming time, and swarm they will, weather permitting, while queen cells or queens are in the hive. The bee-keeper who does not take the necessary steps to remove surplus queen cells at the proper time will be the loser. When all is going well the eighth day after the issue of the first swarm is a good time, but it is better a day or two earlier, as it will make things more sure. With frame hives the bee-keeper should not resort to returning swarms on the primitive straw skep style.

DESTROYING THE CELLS.

This is much quicker and more satisfactorily done than watching for after swarms, hiving them often with great difficulty, then uniting them with the chance of their taking wing, as they often do when shaken, and if successful swarm again after all the labour.

SELF HIVERS.

These, so far as I have ascertained, are unsatisfactory. The whole swarm does not join with the queen; besides, the drones are worried to death, giving the bees much labour in their vain endeavour to carry them through the perforated zinc, which also hinders the bees greatly in getting out and into the hive. If self hives are to do what is claimed for them they must be made so that the queen and bees will be intercepted in their natural retreat—that is, under the alighting board. A box serving as that must take its place, having wide grooves on the top to allow the queen and drones to pass. When returning the bees will follow, when the box may be removed, and bees placed in a hive on the

site of the old stock. The entrance to the stock hive should be fitted with a cottage gardener's bee trap the full width of the entrance, regulated so that bees can enter the hive on their return from the fields, but to prevent the queen or drones over this box or landing board a cage of queen excluder zinc must be placed, showing a large surface so as not to hinder bees more than is necessary. But, after all, artificial swarming will not give a tithe of the trouble, time, and expense self hivers will, and will be far more satisfactory.

QUEENS BY POST.

In common with many others I was highly pleased to see that "A Hallamshire Bee-keeper" has managed to get the Postmaster to make concessions in the transmission of queens by post, managing what nearly every prominent bee-keeper in this country had failed to get. It was only after great labour that the Americans succeeded.

I could scarcely believe that any gentleman in England cognisant of that fact would from mere personal feeling attempt to deprive bee-keepers of the privilege, at the same time pretending friendship to them. As we prove the purity of metals by modicums, so do we judge and prove men by their little or petty tricks. I trust bee-keepers will be able to recognise their true friends in the future by their past conduct.—A LANARKSHIRE BEE-KEEPER.

* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

The Rating of Market Gardens (*G. W. J.*).—The point you raise is one on which a lawyer should be consulted, and we shall be glad if you will let us know the purport of his reply.

Herbaceous Plants (*B.*).—Lilies and other bulbous plants are herbaceous, as are all plants which die down in the winter and grow again in the spring or summer. Strictly speaking, herbaceous plants are those perennials which are the reverse of woody.

Stopping Young Vines (*T. S.*).—You must not stop the young rods now. Let them grow as much as possible this summer. They will, however, require cutting back during the winter, when pruning the Vines; but if you write again giving full particulars of their condition then we shall be pleased to advise you further.

Woodlice in Mushroom Bed (*J. W., Armley*).—Procure some old dirty decayed boards, place them face to face in pairs, lay them on the bed and by the side of it, and cover them with litter. Woodlice love to lurk between the boards, and if these are examined occasionally the numbers of the enemy will soon be thinned. For the other insects mix 2 ozs. of salt in a gallon of tepid water, and apply it to the beds. If these methods do not answer to your satisfaction write again.

Red Spider on Cucumbers (*York*).—When badly infested with red spider Cucumbers seldom recover their normal health. Perhaps you would do best by pulling them out and making a fresh start with strong young plants. These would fruit freely in the autumn in a heated house. Still, if you wish to give the old plants a chance cut off the worst leaves and syringe the remaining ones with a solution of softsoap at the rate of 2 ozs. of soap to a gallon of water, or any of the insecticides advertised in this Journal, taking care to wet the under side of the foliage. After applying the insecticide syringe vigorously with clean tepid water. Top-dress the roots with fresh soil, and maintain a moist warm atmosphere to induce fresh growth.

Repotting Eucharis (*F. C.*).—Early spring is the best time to divide and repot large plants of Eucharis, although it may be done at

the present period. In your case, however, it would be advisable to defer the operation until February or March. If retained in the pots they now occupy and judiciously supplied with liquid manure the plants will, if healthy, flower much more freely than if repotted now. *Eucharis amazonica* will thrive in a compost of fibry loam, a little leaf mould, and sand. It is by no means a good plan to disturb *Eucharis* unless really necessary; if yours are healthy and flower satisfactorily leave them alone.

Raising Vines from Seed (*F. C.*).—The best way to proceed is to sow the stones as soon as they are taken from the ripe fruit, placing them singly in 3-inch pots filled to within half an inch of the rim with fine soil, placing a seed in the centre half an inch deep. Keep just moist in a house from which frost is excluded, and at the end of January or early February place in heat, keeping moist. The seedlings will soon appear, and should be grown near the glass, shifting from the 3-inch to 5-inch, and from those to 7-inch pots, which will be sufficient the first season. If you have convenience, the pots containing the seeds may be placed in heat as soon as sown, growing as rapidly as possible, and planting the seedlings out in a position in spring, so as to secure a strong and well-ripened cane, when it may fruit in the second year. If raised and grown a year in pots it is better to plant the Vines out than attempt to fruit them in pots, or graft them on to existing Vines. This is safely effected on the young wood by inarching, and the varieties come more in character and sooner when grafted than on their own roots. If the seeds are kept until spring and become dried some of them may lose their vitality.

Marantas for House Decoration (*L. J.*).—Marantas are not amongst the most useful plants that can be grown for the embellishment of rooms. We have long since discontinued their use for this purpose. They enjoy a close, moist, warm, and shady atmosphere, and when used in rooms they soon become so seriously checked that a long time must elapse before they are again in good condition. The old *M. zebrina* is certainly the best of them for rooms, as it is not easily killed; but even this plant is not so suitable as a good plant of *Aspidistra lurida variegata*. *Araucaria excelsa* is one of the most useful plants that can be grown for rooms. We find *Caladiums* invaluable from June to September. These are grown in from 4 to 7-inch pots, pushed on in heat until they are well developed, and grown well exposed to the light, so that they are sturdy. They are then given vinery treatment for a time, then nearly a cool house, after which we find they stand well in rooms. We certainly prefer them to Marantas. The old *Alocasia metallica* in a small state is useful for rooms, because a large stock can be so quickly obtained. If the plants you use at present are confined to Palms and Ferns almost exclusively we shall be pleased to give you a list of suitable plants if you write to us again. But we do not advise you to grow Marantas for the purpose.

Insects on Peach Shoots (*Killmright*).—The shoots have been badly infested with brown fly (*Aphis persicæ*). Before reaching us the parasites had left their "seats" on the young wood and leaves and spread over the inside of the box, and were crushed or starved to death. The case is a bad one, the worst we have seen, and the ordinary cleansing agent does not appear to have been employed—namely, forcible syringing with clean water, for the shoots have been infested the greater part of their length. The insect is rather difficult to deal with, as it fastens on the growing points of the shoots and basal parts, as well as next the midribs of the leaves, and clings persistently to the place of attack. Indeed, the pests for mutual protection are as closely packed on the shoot or leaf as they can stand, with their heads to those parts and their tails outwards, and being bright and smooth they throw off insecticides intended for their destruction. Hence careful and experienced gardeners brush over the infested parts with the insecticide first, or rub the attacked growths with the fingers dipped in the insecticide. This disturbance places the insects in a position to be effectively assailed by spraying or syringing with the insecticide. It is necessary to pay assiduous attention to the trees afterwards, for all the insects may not have been reached by the insecticide, and those that remain soon found new colonies or spread in the old with amazing rapidity. Keep a sharp look-out, and when an enemy is seen promptly "touch up" the attacked part with the insecticide. That is the only way to keep down insects, combined with thorough cleanliness and proper management.

Bordeaux Mixture v. Carbonate of Copper in Ammonia (*D. Watson*).—In answer to your inquiry we cite what Mr. T. Greiner, a well-known fruit grower, says in an American paper:—"The Bordeaux mixture, I believe, will soon be played out. It has various objections. First, it is expensive—much more so than simpler solutions. It is troublesome to prepare and to apply, as it has to be strained through a fine sieve, which is often quite a task, and even then it is apt to clog the spraying nozzle. Next, you get all soiled with the white, waxy stuff, and if it gets on fruit it sticks, and perhaps causes more trouble. Why should we apply it at all when we have in the solution of copper carbonate in ammonia a liquid that is almost as effective in the prevention of plant diseases, much cheaper, and much more readily prepared and applied? The concentrated solution can even be bought prepared, and with the required quantity of water added, is then ready for the spray. It goes under the name of "copperdine," costing only \$1 per gallon, which quantity is sufficient to make 100 gallons of spraying liquid. At this cost we can afford to make two sprayings instead of one with the Bordeaux mixture, and then we save money." Copperdine is not, so far as we know, sold in

this country, but the method of preparing carbonate of copper in ammonia has been described in these columns.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*A Constant Subscriber*).—1, *Malva moschata alba*; 2, *Limnanthes Douglasi*. (*F. J.*).—No, it is the Caper Spurge, *Euphorbia Lathyris*. (*T. E., Coventry*).—*Eucomis punctata*. (*Young Gardener*).—1, *Oenothera Lamarckiana*; 2, A florist's variety, not a species; see the above conditions; 3, *Linaria reticulata* varieties; 4, *Lychnis chalcedonica*; 5, *Lychnis coronaria*; 6, *Maurandya Barclayana alba*. (*A. H.*).—*Hyoscyamus niger*, the Henbane.

COVENT GARDEN MARKET.—JULY 13TH.

MARKET well supplied with outdoor fruit. Prices lower.

WEAK POINTS IN AGRICULTURE.

If education expands the mind, strengthens the intellect, and enlarges individual capacity generally, why is it that we find learned professors, editors of agricultural papers, and other men of light

and leading so outspoken in their opposition to efforts for the enlightenment of farmers? It is simple nonsense to assert that farmers do not require such aid. If that were so, what need would there be for agricultural colleges such as Cirencester, Aspatria and Downton? It is certain that very few farmers of the present generation have had the benefit of such instruction as is given at these institutions, and that the knowledge they possess is precisely of the superficial character which follows mere routine, without inquiry into cause and effect.

In one point only is there unity of opinion—*i.e.*, of the gravity of the situation—for no one at all reasonable can deny that farming is now a struggle for bare subsistence, or that very much of the land has fallen in value by considerably more than one-half. The case is simply one of cause and effect. Rents for all corn farms have fallen so low that the purchase of land even at proportionately low prices is regarded as decidedly a speculative investment, so much so that not a week passes by without its record of abortive attempts to sell farms, or of sales effected at exceptionally low prices. Cheap corn, reduced rents, struggling tenants, landlords' difficulties, mortgages, sales, residences of county families closed, or let, is the lamentable sequence of an agricultural depression that is now in its second decade. Surely, then, it is reasonable to inquire if any improvement from within is possible, to gauge our practice, to seek for its weak points, and see if by improvement we cannot achieve better results rather than to cry for aid from without. It is alike vain to expect such assistance, or to ignore the fact of markets open to the world, of ever-growing facilities for ocean traffic, of imports of farm produce increasing in quantity and variety every year. Clearly, then, it should be our aim to strive for improvement both in the quality and quantity of home-grown produce, to accept the challenge of the foreign producer, and meet him at every possible point with samples so superior to his that a ready market and prompt sale at high rates become a certainty.

This implies, in live stock breeding by selection, as is so well done already among horses in our Norfolk hackneys, Suffolk shires, and Clydesdales; among cattle, in Red Polls, Galloways, Herefords, Shorthorns, Devons and other pure breeds; in such sheep as Shropshires, Suffolks and Hampshire Downs; in swine such as Large Whites and Middle Whites. But this is not the class of stock to be met with at the farm of an ordinary tenant farmer; with him mongrels are the rule, anything like pedigree stock the exception. So, too, with his crops both on arable and pasture land; they may be respectable, but seldom indeed is it that they approach a high standard of excellence. Much more stress is wont to be placed upon seasons and weather than upon high culture or possible improvement. There are striking exceptions in our best home-grown Barley and Oats, in the fruit of Apples and Pears from young trees under skilful cultivation, in the factory butter of both English and Irish dairies, in our poultry where special attention is given to it as in Sussex, where there is now an annual turn over of some hundred thousand pounds in this business. Energy and intelligence tell us much in farming, perhaps more strikingly now than in most other things. Proud indeed were we of the fruit farmer whom we heard last autumn telling a Manchester audience how his West of England Apples had in the market of that enterprising city sold for much higher prices than the best imported fruits.

We must foster a spirit of enterprise, must launch out and cater for the obvious growing requirements of our fast increasing population. What care consumers whether the article they require is foreign or English? Only an hour or two before writing this article we were enjoying the hospitality of a lady, who told us she had given preference to some excellent American cheese at a local grocer's simply because it was so superior in flavour to any home-made cheese she tasted. Is it not a disgrace that at the recent meeting of the "Royal" at Warwick there was no competition for

the prizes offered for home evaporated fruits? Much to its credit, the premier Society again offers similar prizes at its next meeting at Chester in 1893, together with prizes for whole-fruit jams, collections of bottled fruits, collections of preserved fruits for dessert purposes, collections of preserved Peas, French Beans, Tomatoes, and Mushrooms for cooking purposes, cider and perry made from fruit grown in 1892. All these things should come now under the comprehensive term of farm produce, and we may well remind those who sneer at fruit farming that in the United States of America within the last decade a large and flourishing business has been built up in evaporated fruits mainly for exportation to this and other European countries.

WORK ON THE HOME FARM.

Some heavy showers of rain have done much good to all growing crops, and no material harm to mature hay crops. There has been plenty of wind and sunshine to enable us to save much good hay, the prospect being now much brighter than it was last year, so far as regards an abundant supply of good fodder for winter. Early root crops have come on so fast that the leaves are already meeting between the rows, and no farther hoeing will be required. Later crops flourish in the warm moist rich soil, growing quickly out of harm's way, insect pests never doing much damage in warm showery weather.

Much of loss and disease among swine is caused by filthy stys and unwholesome food. Because pigs consume garbage so freely there is much reckless use of improper food for them. At dairy farms a considerable number of pigs are reared to consume the whey and buttermilk which runs through a pipe from the dairy into a cistern where meal is mixed with it for the pigs. With a close fitting lid to the cistern, gases generated by the fermentation which often sets in after meal is stirred in, cannot escape freely; the food becomes sour, unwholesome, and dangerous, especially for young pigs. The risk of harm in this way is easily avoided by fixing an air pipe to the cistern, and mixing the meal with the whey as it is used. It is a good plan to withdraw swine from yards and stys, giving them a run in the rick yard and home close now, and after harvest upon stubbles. As winter Beans become full podded they are used for the pigs, making a wholesome and cheap addition to their dietary. All walls and woodwork of pig-stys and hovels should now have a thorough dressing with limewash, yards cleaned out, floors and yards repaired, drains scoured, and the whole place made sound and clean for autumn and winter use.

Stubble pigs are likely to prove very profitable as prices are so high, and farmers who have kept up their stock of breeding sows will probably find a full herd of swine more profitable after harvest than an equal number of sheep. Prices fluctuate, low prices, especially for pigs, often leading to rash sales. It is better to keep a fair proportion of each sort of live stock, as something or other can then be had which goes well at market, and extremes are avoided. Careful management and judicious feeding generally enable one to tide over market fluctuations; the chief point is to always have something good for sale, something to bring in the nimble ninepence rather than the slow shilling.

REMARKS.

3rd.—Unbroken sunshine.

4th.—Breezy, and cloudy at times.

5th.—Windy and generally bright in morning; continuous rain from 3 P.M. to midnight.

6th.—Brilliant early; alternate sunshine and cloud during the day; spots of rain at night.

7th.—Generally overcast in morning, with a slight shower about eleven; sunny afternoon. S.W. gale all day.

8th.—Fresh, breezy, and sunny.

9th.—Sunny and warm in morning; cloudy, with one or two slight showers in afternoon.

A windy and rather cloudy week. Temperature slightly above the average.—G. J. SYMONS.

WHEN Mr. John Wills, now of Onslow Crescent, London, but in 1863 head gardener to Sir Philip de Grey Egerton, Bart., at Oulton Park, Cheshire, created a sensation by his wonderful display of *Viola cornuta*, a plant then comparatively unknown excepting in botanical gardens, he little dreamt of the wide-spread popularity of the grand race of *Violas* we now have, and their great beauty and very extensive use for early spring and summer bedding. Not being quite certain as to the date of Mr. Wills' introduction of *V. cornuta*, I wrote to him on the subject, and in a long letter now before me he writes:—

"I saw at the Wellington Road Nursery in 1862 six plants of this pretty, and as I saw, most useful plant in flower, amongst their collection of hardy herbaceous plants, and I was so much struck with it that I wanted to buy the six plants, but Mr. Andrew Henderson declined my offer. After a good deal of pressing he let me have three plants, which I gladly took with me to Oulton Park and set to work to propagate. It was at the end of the summer, and I kept on driving away at their propagation through the following autumn and winter, and by May in the following year I was able to plant several large beds in the flower garden with them, besides in two long ribbon borders each 1500 feet long. They were a lovely sight, and when the shades of evening were closing around I looked on with intense pleasure, and my noble employer and all his friends were profuse in their expressions of delight at the arrangement, and my dear old friend, the late Robert Fish, when he saw it was transfixed to the spot with surprise and delight. I obtained *Viola lutea* in 1864 from Mr. Tyerman, then curator of the Liverpool Botanic Gardens, and I grew this largely at Huntroyde Park, Burnley, Lancashire, as well as *V. cornuta*, of which I had then fully a mile as edgings to the flower borders, in the kitchen garden, and elsewhere."

Mr. Wills' letter is full of pleasing reminiscences of days long past, and to which I may refer on another occasion. It is, therefore, nearly thirty years since Mr. Wills brought under notice the beauty and adaptability of *Violas cornuta* and *lutea* as bedding-out varieties. Previous to this date the late Mr. Fleming had been using bedding Pansies extensively at Cliveden, and for a long time the Cliveden forms of yellow, white, blue, and purple were used there and elsewhere; and although the yellow, white, and blue kinds have been superseded, and are now out of date, the old Cliveden Purple under this and other names is still extensively grown, and nothing has beaten it for large masses. I saw some splendid beds of it in May at Stoneleigh Abbey, near Kenilworth and Warwick, where my good friend, Mr. Beddard, gardens so wisely and well.

It may be of interest to some of our younger gardeners and amateurs to get a glimpse of the early history of the *Viola*. In Don's "General System of Gardening and Botany," published in 1831, 170 species, besides varieties, are enumerated and described. *Viola cornuta* (to which I have already alluded) is a native of Switzerland and the Pyrenees, and on Mount Atlas, and is further described as "The Horned Violet or Pansy." *Viola lutea* is also described by Don as a native of moist mountainous districts and pastures in Wales, the north of England, and in Scotland, and in this species all the petals are bearded at the base. *Violas lutea* and *lutea grandiflora* are still cultivated in many gardens for their very

early floriferous habit of blooming; and in the Botanical Gardens at Edgbaston, Birmingham, two large beds of the latter variety are now in full bloom, but *V. Bullion* and others are now superior, and of the same colour.

Viola calcarata is a distinct species, with better formed flowers than most of the species, and from this species I think we may trace some of the parentage of our modern *Violas*. Mr. Latham, of the Edgbaston Botanical Gardens, drew my attention to a charming coloured illustration of it in a German botanical work, "Alpenpflanzen," edited by Joseph Sebroth and Frederick Graz, published at Prague in 1881, a work very little known, but of great interest to the student interested in hardy plants, as it is rich in a number of admirably coloured illustrations. The flower is of a brownish lilac colour, with the broader petals of the modern *Viola*, but with the horn very distinctly developed. It is described by Don as a native of the higher mountains from Austria to Provence.

Viola tricolor, the old form of Pansy, a native of cultivated fields and gardens throughout Europe, Siberia, and North America, is also plentiful in Britain. In this species we have the parent of the grand exhibition Pansies of the present day, and our old writers record many pleasantries in connection with this flower. Don says, "The Heartsease has ever been a favourite flower with the people, and has many provincial names, all bearing some allusion to love. In the days of superstition it was called Herb Trinity, probably from the three coloured flowers. Heartsease is the general name by which it is now known, its most elegant name being Pansie, from the French *pensée*, and the meaning is to be found in Shakespeare's tragedy of "Hamlet," where Ophelia says, "There's Pansies, that's for thoughts." Heartsease was also reputed by our old writers on the "Materia Medica" as a powerful medicine in epilepsy, ulcers, and cutaneous complaints; and Haase, who administered it in various and large doses, extended its uses to many chronic disorders.

But to return to our *Violas*. I think *V. cornuta* Perfection was sent out somewhere about 1870 by Mr. B. S. Williams, and Enchantress and Magnificent were sent out a year or so after, I believe; but I fail to remember the exact date, and if one or more did not emanate from the Wellington Road Nurseries. In 1873 Mr. Richard Dean introduced Blue Bell, a variety which retained much of the *V. cornuta* character, and it rapidly became most popular. It was a chance seedling in his garden at Ealing, its origin being singular, as he had not previously had any *Violas* there. This variety is still cultivated extensively, and in masses is very effective. Messrs. Dickson & Co. of Edinburgh also took the *Viola* in hand, and raised a great many varieties, and I regret that I am unable to say here which of the leading varieties of the present time were raised by this firm.

Some nine or ten years since I introduced True Blue, a seedling of my raising, still the best blue we have, of close compact habit, very early and continuous in blooming, and of good constitution, and really with a strong blue shade of colour in it. Then, just after, Mr. B. S. Williams introduced Mrs. Gray, a seedling raised at Eglington Castle, Scotland, a free growing free flowering white; Then came many new varieties from various sources, and a great impetus was given to the *Viola* in the splendid batch of new varieties raised by Mr. Baxter of Daldowie, and sent out about four years since. This batch included Spotted Gem, Ethel Baxter, and York and Lancaster, still popular varieties. Their name is legion now. Raisers are at work throughout the kingdom, and I may, I think, lay some little claim to having raised some very fine sorts, such as Queen of Lilacs, Bridesmaid, Golden Queen of Spring, Golden Gem, Golden Circle, Master of Arts, Sir Joseph Terry, and others. What I now dread is the influx of many varieties which are really bastard Pansies and do not hold the *Viola* type of character; also bad washed-out colours and varieties of *Violas*. A large number of flowers of seedlings are sent to me during the

year for my opinion, and although it may not to some be worth much I claim to know as much about Violas as anyone, for I have for years consistently written and advocated the cause of the Viola. But I give out a strong word of warning that the time has come when we can no longer tolerate such rubbish as Moonlight and some other new varieties recently introduced, and that I, for one, so long as life is spared me, will enter my protest against their introduction.—W. DEAN.

(To be continued.)

NOTES ON SALVIAS.

As greenhouse plants for autumn and winter flowering there is nothing, I think, more useful and worthy of extensive cultivation than the Salvias, for probably at no season of the year is it more difficult to keep up a display of flowers than at the commencement of October, before the main bulk of Chrysanthemums are in bloom. Salvias may be grown out of doors during the summer months, but they must be housed before frost appears, as they cannot withstand severe weather. The plants should be propagated for all purposes in spring and early summer, the cuttings being placed in a gentle bottom heat, when they will root readily, and providing due attention is paid to the potting plants may be had that will bloom in the greenhouse throughout the autumn and winter.

Salvias delight in a rich open soil, particularly when grown in pots. Fibry loam and well-decayed manure in about equal parts, one-fourth leaf soil, and a sprinkling of silver sand will form a very suitable mixture for them; 8-inch pots are, I think, quite large enough to grow plants for general purposes, but if extra large specimens are required 10 or 11-inch will not be too large.

The following are some of the most useful kinds, and they should be grown in all gardens where a supply of flowers is required throughout the winter. *Salvia patens* is one of the most distinct and beautiful deep blue flowering plants in cultivation. Seeds sown in March will form capital plants that will commence flowering in June, and continue till the end of the summer. The flowers, which are produced in considerable quantities, are large and of a lovely bright gentian blue colour, making charming plants for greenhouse decoration. For summer bedding or the open border it is invaluable, growing to a height of about 2 feet, and flowering more or less all the summer.

Salvia Pitcheri is also a very useful and most desirable plant. Its flowers, which are freely produced on branching stems 2 to 3 feet in height, are of a beautiful azure blue, and the plants continue in bloom all through the autumn. *Salvia splendens* is a very beautiful and useful variety, producing its bright scarlet flowers with the utmost freedom. This variety is well adapted either for mixed borders or summer bedding, but is seen to the best advantage when grown in pots for greenhouse decoration, being one of the best for winter flowering.

Salvia rutilans is, without doubt, one of the most valuable and generally grown of all the Salvias, being invaluable for general purposes. It is an exceedingly free bloomer, producing quantities of small yet very pretty spikes of flowers of a lovely magenta colour. The foliage is delightfully fragrant, hence it has derived the name of Pine Apple-scented Sage.

Salvia gesneriflora is a magnificent species, deserving a place in all collections of Salvias; indeed, none would be quite complete without it, as it is one of the last to flower, which is a great consideration where a succession of bloom has to be maintained. Its flowers, which are produced in abundance, are very conspicuous, being of a bright scarlet colour. Care should be taken not to pinch the growths after July, the secret of growing this variety being to produce good stout growths, failing which it is useless to expect satisfactory results. Liquid manure applied twice a week will prove very beneficial at the flowering period. Salvias *leucantha*, *Betheli*, *Grahami*, and *fulgens* might also be included with great advantage where a greater variety of colours are desired.—GEORGE PARRANT, *Ashby St. Ledgers Lodge, Rugby.*

PEACHES AND NECTARINES.

VARIETIES FOR EARLY FORCING.

THE very early Peaches Alexander, Waterloo, Early Beatrice, Early Louise, Early Rivers, and Early Leopold, with the very early Nectarines Advance and a little later Lord Napier, have a great advantage over the older varieties in that they need not be started before the new year to ripen the fruit in May and early June without recourse to hard forcing. The fruit may be had a month

or six weeks earlier, but it is at a sacrifice of quantity, size, and quality, greater outlay in fuel, and more waste of the energies of the trees. To have such varieties as Grosse Mignonne Peach and Elruge Nectarine ripe in May or early June the trees must be started early in December, and they have to flower and make their foliage at an unfavourable season, so that the buds do not form well, and are frequently cast in quantity from no other cause than the imperfect formation of the buds. The large-flowered varieties are very prone to throw off the buds, and do not set nearly so freely nor perfectly as the small-flowered varieties. All the Early York race are liable to imperfect bud formation and to cast them in "showers" when they are expected to swell. If opened they will be found to have effete ovaries and defective stamens. The Early York race of Peaches are also prone to over-maturity of the buds when early forced in consecutive years, and sometimes expand and even set the fruit in late August or early in September.

Grosse Mignonne and all its race are not good for early forcing, often forming triple blossom buds at a joint, and cast all those and many other large promising buds. Noblesse and all its tribe form plenty of prominent buds and if early-forced two or three years sheds a majority of them. Those remaining have, as seen when the flowers are fully expanded, twin, sometimes triple, and occasionally quadruple ovaries, long thin antherless stamens, whilst many flowers have poor ovaries, short styles, and the stamens are short, curved inwards in a heap over the pistil, and pollenless. All of the Early York (except Hale's Early), Grosse Mignonne, and Noblesse races of Peaches are not suitable for early forcing to ripen the fruit in May or early June where it is expected to be remunerative, for they are nowhere as compared with the Royal George and Early Albert (Grosse Montagne) races, either as regards quantity or value of crop. The size, appearance, and quality of the Early York, Grosse Mignonne, and Noblesse races is not disputed to be of the best, but it is the eligibility of these and their varieties for forcing before or even with the new year that is questioned. Started in January or February and brought on slowly they are seen to advantage in the fruit at midsummer and later. The varieties with large flowers are not as a rule such good early forciers as the varieties with small flowers. But some may take exception to this dictum, and insist on some that have large flowers, as Alexander, Waterloo, and Early Beatrice being good setters. Now Alexander and Waterloo have flowers about half the size of those of Early York, and Early Beatrice has very much narrower petals like its parent, the White (Rivers) Nectarine, than Hale's Early, and this variety has narrower petals than its type (Early York). What a variety has gained in petals it seems to have lost in vigour of pistillate and staminate organs.

Early Rivers (a grandchild of the White Nectarine) has gained nothing by making a departure from the characteristics which stand Early Beatrice in such good stead or to insure a good set, but has lost so much that it (Early Rivers) either sets about half as many fruits as Early Louise, or the set is so imperfect that the fruits "crack at the stone" and are useless. This defect can be overcome by fertilising the flowers of Early Rivers, and all the large flowered varieties with perfect ovaries, with the pollen of other flowers, to wit the small flowered varieties. None, perhaps, sets better than Early Louise, a seedling from Early Albert, which sets when others do not, and is well worth growing for its pollen to fertilise other varieties where a difficulty arises with them in setting; but it is not in any nurseryman's list, not even Mr. Rivers', and may not be procurable. Early Louise will, however, answer quite as well, and it ripens plenty of fruit in May when started at the New Year, and the quality is excellent for an early Peach.

Early Leopold has small flowers, bears well, and succeeds Early Louise. Dagmar has plenty of colour both in the flower and in the fruit, the former small and the latter large, and is of the free-setting Early Albert race, ripening its downy, deep crimson, handsome, melting and rich fruit soon after Early Leopold. The difficulty, if any, with these small-flowered varieties is in the abundance of their flowers, which are often weak in consequence, and should be freely thinned before the flower buds are fully open. This will cause the flowers left to be bolder, and they will afford pollen freely for fertilising other varieties, whether Peaches or Nectarines.

Of these early Peaches we should select Alexander and Early Louise, and grow them in a house by themselves for a first early supply of fruit, say in April and May, and the house being closed by the middle of December, and forcing commenced at the new year, the fruit would ripen at the time named without pressing the trees so hard as to prejudice their future bearing. If a Nectarine was desired Advance is the most likely variety in commerce to afford fruit about the same time as the Peaches. The trees could be forced to produce fruit in less time, but it is better to have trees in pots for such "express" work as placing ripe fruit on the table in three months from starting. This is a very

desirable method of growing very early Peaches and Nectarines, and a greater variety and longer succession of fruit can be had from a house of a size needed to grow a few planted out trees.

The best of all Peaches, however, for forcing are the small-flowered varieties, and it is the same with Nectarines. Royal George and Stirling Castle Peaches are unique for early forcing, and there is less failures with them than any other. The trees recuperate better than other varieties after forcing and carrying a heavy crop, and are not liable to over-development of the buds, and do not cast them during the rest season. In fact, they are "sensible" trees, concentrating all their forces on ample growth to assimilate and nourish the current crop; and when that is perfected they set to work and form buds on wood then apparently having nothing but wood buds, and plump them up, not too large, so as to leave no doubt of their giving a full crop of fruit the following season. These are my favourites. Crimson Galande is another first-rate forcing or any-purpose Peach. It is prolific and vigorous; the fruit is brilliant and the flowers are small.

In Nectarines we have Lord Napier. Large flowers! That may be, all the same it is of the Early Albert Peach—the free-setting race, and heredity tells; besides, the petals are narrow, and it is not all show, but with plenty of substance in the ovary, boldness of style, and prominent pistil, with stout stamens, and noble pollen-laden anthers. Its flowers and fruit cling to the branches with remarkable persistency. Then there is Stanwick Elruge, with small flowers, that would if allowed bear itself to death, and the much finer Dryden, best of all, bar one, for cropping, size, colour, and quality, and it has small flowers. Finally, there is Victoria, the finest of all, and it has small flowers. All these force well, and if there is fruit on any it is on those varieties that have, as a rule, the best ovaries and the most perfect stamens, and they are the best varieties for forcing.—G. ABBEY.

DINNER TABLE DECORATIONS.

THERE seems to be a wide difference between dinner table decorations as they really are and as they are presented at exhibitions. What is usually seen at real dinner parties very naturally depends upon the taste of the hostess, or lack of taste; but those who have to provide real dinner table decorations declare that three-fourths of the arrangements seen at exhibitions would be absurd or impossible in the bulk of ordinary dining rooms. Now, at exhibitions the surroundings have no connection with the colours employed in the table dressings. They are out of the question, and are absolutely ignored. But real dinners take place in rooms, though sometimes large ones. Large or small, these must be of a certain style of decoration, and have in the walls, doors, and hangings, certain predominating colours, which to suit the usually dark hue of the furniture are dark also. Anyone familiar, therefore, with the glaring or gaudy tints seen in the flowers of the modern dinner table dressings at shows will have no difficulty in realising the utter want of judgment shown in connection with many; indeed, the show table decorator seems to cater for what may catch the public taste, which is in this case not at all a cultivated taste, rather than to create combinations which would harmonise with ordinary dinner table surroundings.

It would be very difficult to find anything more incongruous for instance than was seen at Croydon the other day, where a number, certainly not less than five, metal arches ranging from 4 feet to 4½ feet in height in the centre and from 3 feet to 4 feet wide at the base, were dressed almost entirely with gaudy Shirley Poppies, Grasses, and Gypsophila flowers. It is very easy to understand how ridiculous these things looked, and what a consternation they would create were they stood upon any ordinary dinner table in a quiet toned room. A very considerable modification of these arches was seen at Earl's Court the day previous in the smaller wire constructions used by Mr. Chard. These are about 6 inches broad, and range from 18 to 20 inches across and high. The bases stand in zinc trays, and the flowers dressing the arches are in small glasses hung at intervals on the wirework, so that both the general grouping of the flowers and the diverse effects in colour can be produced at will. These arches, whilst lightly dressed, are as objects of decorative art pretty enough, yet have the demerit of seriously obstructing the intercourse which should always exist between guests at a dinner table. It is indeed to be feared that nearly all dinner-table floral decorations more or less do the same thing, and wherever such is the case, let their beauty be what it may, they seriously mar what should always be the best feature of a dinner party—pleasant conversation and intercourse. As in connection with show table decorations no test as to this important matter is ever applied, things pass muster which would not be tolerated in private life.

It might be expected that ladies presumably educated as regards taste would make in these matters the best judges, but it very often happens that they make a veritable hash of their awards; and rarely would male judges approve of their decisions. Some table decorators make their arrangements so light that they give no tangible effect, others make theirs so heavy that the tables almost groan under the weight of flowers; some are horribly incongruous in coloration; but very few indeed seem to succeed in producing what affords absolute satisfaction.—A. D.

A NEW STRAIN OF ROSES.

It now appears that the Rose may be added to the list of plants which may be treated as annuals. Seeds of a variety, under the name *Rosa polyantha remontant*, received from a French seedsman early in the year, were sown on January 10th. They germinated rapidly in greenhouse warmth, and, after being pricked out, have been grown in a pan on a shelf in the cool house. They are now small plants, 2 to 3 inches high, and every shoot apparently is carrying a bud. The first flowers opened on April 9th, just three months from sowing. The flowers are coming in considerable variety, white and pink mostly, single and semi-double, an inch or more in diameter. At present they are charming little plants, with small stems and light green foliage. With their prolific flowering habit and rapid growth they can scarcely fail to prove useful and attractive garden plants.

Their precocity is certainly novel and interesting. Some few years since Carnation growers were much surprised by the introduction of a strain of these flowers which could be had in flower in four or five months from seed, surprise which has given way to satisfaction with the desirable *Marguerites*.

Perhaps, the Rose having developed a precocious habit, we may be favoured with even finer forms than *R. polyantha remontant*. It would seem that flowers are being inoculated with some of the rapidity of the age.—J. N. GERARD (in *Garden and Forest*).

TEA ROSES IN POTS.

LARGE established plants that are in pots as large as it is necessary to have them in may be repotted and stood or plunged in a sunny position outside. In repotting carefully work from the old soil amongst the roots until the balls are reduced by one-half. When this is done the latter should be in an intermediate state for moisture. The pots should be well and carefully drained, a little moss or the roughest of the compost being placed over the drainage. The soil comprising the compost should also be in an intermediate state for moisture, and should be pressed moderately firm into the pots. The plants should be staked or tied according to requirements, and plunged before they become dry.

If the pots are plunged at once, the plants syringed twice daily, and the surface of the material kept moist, a thorough watering will not be necessary for some days. The longer the plants can be kept after potting without a thorough watering the better, but the soil must not be allowed to become overdry before water is given, or more harm than good will result. Roses are not long before they commence fresh root action in soil that can be kept for some days or a week in an intermediate state for moisture. The plants also root much more freely when the pots are plunged than when they are stood on walks subjected to the drying influences of the atmosphere.

All flowers should be kept from these plants, and the foliage must be kept clean. They will ripen their wood thoroughly, and be in excellent condition for forcing early next season. Such kinds as *Safrano* and *Isabella Sprunt* are excellent for autumn blooming. These if given the same treatment and taken under glass during September, according to the weather, will break freely into growth, and by the aid of gentle warmth will soon yield a quantity of their small but delicate and useful buds. Plants that need repotting may be so treated without disturbing the balls, provided the soil in which they are growing is perfectly sweet. Young plants worked this season, or any that it may be necessary to develop as much as possible, should be kept under glass, where they will make luxuriant growth if well attended to. Well rooted plants in 7-inch pots may be placed into 10-inch, and those in 5-inch into others 2 inches larger. It is surprising how quickly large bushes can be produced from healthy young plants in 5-inch pots to commence with.

22 The compost for these should consist of fibry loam of a moderately light texture, or it should be rendered so by the addition of sand. The loam should form two-thirds of the bulk, and the other third of leaf mould; to this should be added sand and one-seventh of decayed manure. For plants in active growth under glass a 5-inch potful of some quick acting artificial manure may be added to each barrowful of loam used.—WM. BARDNEY.

STRIKING ROSE CUTTINGS.

RAISING plants by means of cuttings is often delayed until too late in the season. If cuttings of half-ripened wood are taken off with the foliage attached, cut into lengths of two or three joints, and inserted in sandy soil before they flag, nearly every one of some kinds will root. The cuttings should be inserted in hand-lights placed in a shady position, and the top eye only left above the soil. After insertion a good watering should be given, and the handlights kept as airtight as possible. In about a month they will be well rooted, and may be carefully lifted and placed singly into 4-inch pots. If encouraged to grow under glass afterwards they will become well established before winter, and will make capital plants the following season, whether they are planted out or kept in pots. Such kinds as Gloire de Dijon, William Allan Richardson, and others of similar growth will, if well grown under glass the following season and potted as they need it into 8 and 10-inch pots, make good plants for forcing the following spring. Nearly all Tea kinds do well grown in pots, which is advisable if required for flowering under glass. Hybrid Perpetuals do better, and make greater progress if planted out in spring in deeply dug and liberally manured ground. Many Teas and Hybrid Teas grown under glass the whole of the first season will give a bountiful supply of blooms in autumn, when they are scarce outside, and often prove as valuable as if produced during the spring months.—O. M. A.

FAMOUS PRIZE BOXES.

I OBSERVE that in his report of Hitchin Show your veteran correspondent, "D., Deal," refers to Mr. Lindsell's stand of forty-eight at Earl's Court on July 5th as the very best box of Roses he ever remembers to have seen. The Journal reporter, too, considered it "a superb stand, perhaps one of the best he (Mr. Lindsell) had ever arranged" (see page 14). While fully admitting the great beauty and quality of the stand, I am tempted to ask if "D., Deal," has taken into account the marvellous stand exhibited by Mr. W. J. Grant three years ago? I refer to the forty-eight with which he won the amateurs' challenge trophy at the Crystal Palace in 1889. Of the hundreds of fine stands which I have seen during the past few years that recurs to my recollection vividly as the queen of them all. Though the flowers have long since "faded and gone," I seem to see them before me in living beauty. Immense blooms they were, massive but shapely, and of wonderful substance. In colour, in freshness, and in finish they were perfection. The production of such a stand was a great achievement that I do not think has since been excelled. Would that Mr. Grant were showing this season in the same style as then. His meeting with Mr. Lindsell would have been a battle of giants; but we must be thankful to have the grower with us, and the rest, I hope, we may leave to time. I should be very much interested to hear remarks from others about famous stands of the present and the past.—ROSA.

SIR CHARLES E. ISHAM'S ROCK GARDEN.

REFERRING to an illustrated account of the Lamport Rock Garden in a June number of the *Journal of Horticulture* in 1872, I find it is twenty years since Dr. Hogg, with the Rev. M. J. Berkeley of botanical eminence, honoured the same by a visit, it having been commenced twenty-five years previously. The position which the rockery occupies prevents its enlargement; it is therefore much the same now as then, except that the improvements imparted by age and unremitting attention have been the means of its development into an object of contemplation far beyond the dream of its originator, and it probably possesses characteristics differing from all other similar structures. Consequently, should a visit from lovers of that style of gardening be inconvenient, another short notice might not be considered out of place, especially as it is probable that it may not continue many more years in its integrity.

The Lamport Rockery being located in no remote corner nor being in the proximity of trees has enabled it to become what it is. The narrow entrance abuts on the mansion, and consequently is in momentary access to one who arranged every stone and planted every plant. Nevertheless strangers are unaware of its existence until they find themselves in the midst of it.

Although of comparatively small dimensions one of the crags is 20 feet elevation. There have been added since Dr. Hogg's visit

ruggedly constructed excavations in the ground, a feature as effective as it is unusual. The structure being of red sandstone is amenable to the hammer and chisel for the perforation of stones through which the roots of alpine may penetrate into the gritty soil beneath, giving an appearance of incrustations on the solid rock, an effect only to be found in Nature where she displays her rarest charms.

The plants are selected on their merits rather than with regard to variety. The stones being arranged with the utmost care and irregularity present effects of light and shade in the crevices and recesses to an extent which would impart beautiful effects even were all vegetation to disappear. This feature would be absent under the stratified system, which is usually recommended as most correct in the formation of rock gardens.

The crevices are, by unremitting attention, kept properly open, not a leaf being permitted to remain which does not add to the desired effect. Were this to be neglected for a season it would be difficult to rediscover many crevices, and this beautiful if not unique feature would in a measure cease to exist.

The elaborate finishing touches which the rockery daily receives might to some suggest puerility, but it would be difficult to explain why they should be more so in the real thing than in a representation on canvas. Since we are all differently constituted, and as it is not everyone who can appreciate details which require an eye educated for that object, it might be desirable to refrain from writing more than might be received by the general observer.—C. E. ISHAM.

LAYERING CARNATIONS.

PROPAGATION by layering is in general a more convenient method of increase than by cuttings. It is the method most commonly employed for increasing or supplying a young stock of Malmaisons, for the florist section of Carnations and Picotees, and for self and border sorts. By means of layers Malmaisons can be successfully propagated at any season. Most of our Malmaisons are layered in light soil laid on borders, but as a rule it is a better plan to use for each shoot to be layered a small flower pot. The plant becomes well rooted when so treated, and can be repotted at once without any check such as in many cases would occur on lifting from a bed of soil.

Ordinary named sorts flowered during summer in pots are very readily manipulated if the plants are planted out thickly and put into the soil at such an angle as to bring the shoots to be layered close to the ground. These may be rooted out of doors, but I much prefer giving them the protection of a frame, in which they root more quickly. I have occasionally rooted this section in pots, but more often on beds of soil.

Border Carnations are sometimes left year after year in the same place without fresh plants being set out. It is only on some soils that this can be done. At the best it is not a method of culture that can be recommended, for fewer flowers are produced, and those that are are of inferior quality. The layers ought to be taken in July. Early-rooted plants are superior in every respect to those which are not rooted until late in the season, and sometimes so late that no roots whatever are produced. The operation of layering is quite simple. As I was taught, it was more complex than I have found either profitable or necessary. All that is needful is to make a slit down the shoot chosen, turning the penknife outwards when the slit is an inch in length. The tongue thus made is then pressed into the soil and secured with a peg if it springs upwards; if not, nothing further is required beyond firming it into the soil.—B.

CŒLOGYNE SANDERIANA.

THIS rare and beautiful Cœlogyne was introduced by Messrs. Sander & Co. in 1887, through their collector Förstermann. A very fine plant was exhibited at the meeting of the Royal Horticultural Society, in the Drill Hall, Westminster, on July 12th. It had three good spikes, each carrying ten flowers, and was shown by Mr. W. Robins, gardener to J. Vanner, Esq., Camden Wood, Chislehurst, Kent. The pseudo-bulbs are roundish and wrinkled; the leaves are 12 to 15 inches long, and about 3 inches broad, erect, light green. The racemes droop somewhat, are about 16 inches

long, and carry from five to ten flowers. These are 3 to 4 inches across; sepals white, petals white but narrower than the sepals; lip three lobed, side lobes crisped at the margin, striped with chocolate-red and blotched with yellow, centre lobe slightly reflexed, with large lemon-yellow blotch and several raised fringes. The home of *Cœlogyne Sanderiana* is not generally known, but the plants should be grown in an East Indian house. Fig. 9 (see page 59) represents it.—C. K.

ODONTOGLOSSUM GUTTATUM.

Odontoglossum guttatum is fully described in the "Kew Bulletin" for May and June. We gather that the species was sent to Kew for determination by G. R. le Doux, Esq., of Langton House, East Molesey, in March of the present year, with the information that it is a native of Ocaña, whence it was imported as *O. blandum*, *Rehb. f.*, in 1886. It is allied to *O. odoratum*, *Lindl.*, but differs in the shape of the column wings and crests, also in colour. In its fimbriate column wings it recalls somewhat *O. præstans*, *Rehb. f.* and *Warscew.* and *O. crocidipterum*, *Rehb. f.*, which, however, differ greatly in other characters. The flowers are light yellow in colour, irregularly blotched with chocolate, the spots being almost suffused on the upper halves of the sepals, and elongated into three narrow lines at the base of the petals. The lip is bright yellow on the reflexed side lobes, with a few small reddish-brown spots, the calli and disc nearly white, the front part of the lip chocolate and a few paler spots and lines on the erect sides of the unguis. The column is whitish yellow, with a few reddish-brown spots on the sides, face, and wings. The plant has since been presented to Kew.

CYPRIPEDIUM CURTISI.

It is now ten years ago since Messrs. Veitch & Sons introduced this fine *Cypripedium* from Sumatra through their collector whose name it bears. It has become a very popular plant with Orchid growers, and there are few collections which do not contain specimens of it. The plants may be grown readily in the East Indian house, very small pieces producing flowers. The leaves are about 6 inches long, mottled with dark and light green. The flowers are borne singly on scapes 6 to 9 inches high; the upper sepal is broad and acuminate, dark green with a whitish margin tinged with purple, the veins are darker purple; the lower sepal is very small. The petals are green and purplish white, thickly spotted with several shades of purple; the margins are fringed with short dark hairs, and the ends of the petals are recurved. The lip is large, dull purple, spotted and veined with deep purple. Being easily grown under ordinary care and treatment, this *Cypripedium* is often seen in exhibits of Orchids. Several good plants were shown by Messrs. Sander & Co. of St. Albans at the meeting of the Royal Horticultural Society on July 12th, and plants are flowering in the warm Orchid house at Kew.—C. K.

ANGULOAS.

The genus *Anguloa* was brought before the scientific and horticultural world about 1840-1844, chiefly through the enterprise of several gentlemen who had at that date become famous for their Orchid collections. These gentlemen defrayed the expense of a collector, M. Linden, who brought home several fine Orchids from South America, among them being *Anguloa Clowesi* and *A. Ruckeri*.

As a rule the *Anguloas* are robust growing plants, and will succeed in a cool house during the greater part of the year. During the winter when at rest they should be kept dry at the coolest end of the intermediate house, being moved to the coolest house about May or June, when they come into flower. The plants should be potted if necessary as soon as growth commences. They require plenty of moisture when growing, and a mixture of very fibrous peat and loam suits them provided the pots are well drained.

A. Clowesi is a very strong grower. It was collected by Linden in Colombia in 1842, and flowered in 1844 for the first time in Europe, in the collection of the Rev. J. Clowes, Broughton Hall, Manchester. The sepals and petals are bright yellow; the lip is whitish and tinged with orange, and so balanced that it swings backward and forward with every movement of the flower.

A. eburnea is a splendid addition to the genus; it has large white waxy flowers, and the lip is spotted with pink; it is very rarely seen.

A. Ruckeri was introduced from Colombia by M. Linden in 1845; the flowers are tawny yellow, thickly spotted with crimson; the lip wholly crimson.

A. uniflora has flowers that are almost pure white, in some varieties shaded and spotted more or less with pink. It is readily obtained, and easily grown.

There are several other species and varieties of *Angulcas*, but

those mentioned are the best of the genus. The deep blood coloured variety of *Ruckeri* (*A. Ruckeri sanguinea*), which is still very rare, might, however, be included. *Anguloas* should flower in June or July. Examples of *A. Ruckeri* and *A. uniflora* are now blooming well in the cool Orchid house at Kew.—C. K.

CALOPOGON PULCHELLUS.

Greenhouse and hardy Orchids are not so abundant that we can look on the scarcity of so old a plant as *Calopogon pulchellus* without surprise. It might have been expected that it would long since have received wide attention, but it is little known, and until Mr. Ware exhibited it at the Drill Hall on July 12th no one appears to have made an attempt to bring it into prominence. Its

FIG. 7.—CALOPOGON PULCHELLUS.

attractiveness is unquestioned. When well grown it is about 1½ foot high, bearing three, four, and five flowers on a stem. They are about an inch across, and though not large they are eminently pleasing in appearance and bright in colour. Paxton describes them as purple, but this is inaccurate; they are rather of a bright rosy mauve hue, and are borne on slender stems. Though usually grown (where cultivated at all) in a greenhouse, Mr. Ware says that the plant is perfectly hardy. He finds that it is very easily grown, requiring a cool shady spot in moist soil. The engraving (fig. 7) represents it.

ODONTOGLOSSUM AURICULATUM.

A pretty little species closely allied to *O. Lindleyanum*, *Rehb. f.*, but differing in having a hastately trilobed lip, the disc of which is light purple instead of brown. In other respects it is much like the species just named. The sepals and petals are

light yellow with a large light brown blotch near the apex, and a few much smaller ones below. The long claw of the lip, the side lobes and crests are white, the disc light purple, passing into light brown towards the apex of the front lobe. It was imported by Messrs. F. Sander & Co., with *O. nævium*, *Rehb. f.*, and has been sent to Kew for determination on two or three occasions; a living plant has also been presented to the collection, and it has recently flowered. It seems quite constant in character, and different from anything which has before appeared, though at first I thought it must be an anomalous variety of *O. Lindleyanum*. The name is given in allusion to the ear-like side lobes of the lip.—("Kew Bulletin.")

NOTES ON GRAPES.

THE present is a good time to give copious supplies of liquid manure alternately with surface-dressings of Thomson's Vine and plant manure immediately before giving clear water at the roots to Vines swelling their bunches. Providing the drainage is good, and the roots plentiful and active, these waterings may be given every week or ten days for the next month or six weeks with the most satisfactory results. The waterings in every case should be sufficient to moisten every particle of soil composing the borders, whether indoors or out.

In the case of Buckland Sweetwater and Foster's Seedling now changing colour care should be taken to keep the surface of the soil underneath the Grapes fairly dry, leaving a little air on, together with turning on a little hot water in the pipes, in order to prevent the berries cracking. With the same object in view avoid draughts—that is, when the atmosphere is surcharged with moisture. The same remarks apply to Madresfield Court. Where these three varieties are growing together in one house it is an easy matter to prevent the berries cracking, but it is not so easy when they are growing in a house with late Grapes requiring different treatment as regards moisture at the roots as well as in the atmosphere, in which case the above remarks apply.

A free lateral growth may also be allowed with advantage so as to draw away any superabundance of sap from the above thin-skinned berries. Especially is this desirable in the case of Madresfield Court. A few days ago I noticed that some berries in bunches of Madresfield Court and Foster's Seedling close to the top ventilators on the hip roof which were left open a couple of inches all day and night were cracked, the cause being obvious. I reduced the quantity of air to a minimum, and cut out the cracked berries, with the desired effect, no more cracked berries appearing in the bunches.—H. W. WARD.

THE SUMMER GLORIES OF SWANLEY.

MY first visit to Swanley was paid one bitter day in the winter of 1890-91, when the air was keen with frost and the snow lay deep in the cuttings. It was depressing, too, not one of those brilliant days when winter sunshine acts as an antidote to the cold, and makes one feel cheerful even when Nature sleeps, but dark, dismal, and mournful. But a few hours among Mr. Cannell's magnificent Zonals made all things new. The warm and glowing colours of the flowers seemed to create an atmosphere in which one could thaw in comfort, while in their superb size and form food for contemplation and pleasure was afforded, in which the mists of depression quickly vanished. Alas! disappearance, mysterious but complete, attended the record which should have enshrined in the safe pages of the Journal my thoughts and impressions of what I then saw. It passed away without, like the Kilkenny cats, leaving even a tail behind it, and the veil that hides its fate has not yet been lifted. Recollections of the winter glories of Swanley did not, however, vanish with it, and the revelation, for it was nothing less, of the wonderful beauty and value of the "Geranium" in its highest form for winter flowering has left lasting influences behind it. In the summer time Swanley in general, and the "Home for Flowers" in particular, has a thousand added features of interest. The rapidly rising town is one of the great centres of Kentish fruit growing. Apples, Pears, Plums, and Cherries are grown in vast quantities, while the land devoted to Strawberries may be calculated by hundreds of acres. Mr. Cannell's large nursery at Swanley, with its dozens of long glass houses, is now reinforced by a 300 acre farm at Eynsford, close to the first station from Swanley on the Sevenoaks and Maidstone branch. A garden-farm of 300 acres takes some filling, but energy is inborn with the Cannells, father and son, and much of the land is already smiling with flowers. It is largely devoted to seed-raising, for this department is growing apace, and large supplies are wanted. Notes made there must, however, rest unamplified at present, as Swanley furnished as many as space can be found for.

ZONAL PELARGONIUMS.

The time has not gone by, I hope, for a few remarks on these to be read with interest. I do not wish to speak of them as bedders, though there will probably be a revival of them for this purpose some day,

but as pot plants for greenhouses and conservatories. It would hardly be an exaggeration to say that there is still no flower to compare with them for general usefulness. The round-flowered types present us with many varieties of wonderful beauty. The tawdry, puerile talk about "vulgarity" of colour has no application at all to the pink, rose, and salmon shades, which vie with Begonias in refinement and delicacy. Moreover, the trusses are beautifully furnished—neither thin nor crowded—and symmetrical, while the pips are of great size and substance. A man would have a very large watch in his waistcoat pocket if it proved to be greater in circumference than they are. Consider, too, that it is not one month or two months that a supply of bloom can be had, but in every one of the twelve. A good sound compost, a light house, abundance of ventilation in the summer time, and a temperature of 55° in winter are the salient points to provide. There are no plants of equal beauty of which it is so easy to keep a constant succession by means of cuttings all the year round. I doubt if anyone who has not seen a great collection such as that at Swanley, where the plants fill several 100-foot houses, can realise what magnificent possibilities there are in this old flower.

I give the names of a few of the very best singles. Lord Rosebery, bright crimson, splendid pip and truss; White Lady, pure white, dwarf and free; Lord Salisbury, reddish magenta, very large, beautiful shape; Amphion, beautiful pink; Lady Brooke, white, pink centre, very delicate and pleasing in colour; Marquis of Dufferin, crimson magenta, very fine, Duchess of Fife, deep blush, a flower of much refinement; Stella Massey, bright pink, dwarf and free; Mrs. Robt. Cannell, salmon, very floriferous and beautiful; Ayesha, rosy salmon; Beauty of Kent, beautiful salmon, a very fine winter bloomer; Katherine Morton, light salmon; Mrs. Norman, bright salmon, very large and symmetrical; N. V. Noulens, salmon orange, very distinct and free; Maud of Wales, pink, very large and finely formed; Spotted Gem, purplish pink, lower petals spotted; Mrs. Wildsmith, rosy pink, very large pips and fine truss, one of the most beautiful of all; Ethel Lewis, rosy pink; Duchess of Portland, clear rosy pink, a lovely variety; and Swanley Single White, dwarf and pure, very large. Of the doubles the following are chosen as a few of the best:—Colossus, reddish crimson, of great size; Turtle's Surprise, deep velvety self, fine both as a summer and winter bloomer; Lady Lena, salmon, very free; Golden Rain, orange scarlet, very fine; Gripper Banks, orange red, enormous truss; Miller's Gem, magenta, very distinct and fine; M. D. Raydellet, cerise scarlet; H. M. Stanley, deep pink, large, one of the very best; M. Caro, delicate pink, very pleasing colour; Girome, pink, heavily shaded with purple; Le Congo, deep crimson, dwarf and free; Sombre Horizon, intense crimson; Cardinal Lavigerie, magenta, large and exceptionally fine; Edison, lovely magenta; Lord Hartington, salmon, dwarf and very free; Attraction, bright salmon; Beauté Poitevine, bright salmon, dwarf and free; White Abbey, pure white; Hermine, pure white; and Swanley Double White, dwarf, very free, a splendid winter bloomer.

IVY-LEAVED PELARGONIUMS.

Hardly less remarkable than the display of Zonals at Swanley is that of Ivy-leaved. There is a grand collection of double varieties, probably one of the finest in the country. All the best varieties are represented, and the following comprise a special selection of them:—Beauty of Castle Hill, bright rose, very large flowers, freely produced; Beauty of Jersey, scarlet, shaded purple, large, and wonderfully floriferous; Liberty, soft magenta; Edith Owen, rosy magenta, large, and of good habit; Surcouf, bright pink; Giroflée, purplish magenta; Ernest Bergman, crimson scarlet; Flambeau, scarlet, very rich in colour, one of the most useful of all; La France, lilac; Lamartine, orange red; Souvenir de Charles Turner, deep rose, very large pips and bold truss, a free bloomer, of good habit, undoubtedly one of the finest of all; Galilée, rosy pink; Berthelot, magenta, fine pips; Madame Thibaut, deep pink, large pips, and very free; Jeanne d'Arc, white, suffused with lavender, distinct and good; La Florifère, rosy pink, very floriferous; and Isidore Féral, rose, large, and very attractive. Two beautiful singles are Victoria, rosy pink; and Masterpiece, magenta-crimson. It is very satisfactory to find that the Ivy-leaved varieties are becoming more and more sought after. Although not equal to the Zonals in all-round usefulness they are of great value for various decorative purposes, not the least being their suitability for training over light frameworks of stakes or on trellises, which they quickly cover with foliage and flowers.

The collection of Pelargoniums of all kinds at Swanley is wonderfully large and complete. The Show, Fancy, Spotted, Regal, Bedding, Nosegay and Scented-leaved sections are finely represented, but space does not permit of particulars. Mention ought to be made, however, of the splendid bedding Zonal King of the Bedders, a scarlet variety that is an unmistakeable improvement on Henry Jacoby.

TUBEROUS BEGONIAS AND VERBENAS.

There are several large houses full of Begonias, indeed the stock of plants is enormous. The varieties are, moreover, as remarkable for their fine quality as for their number. There are thousands of large healthy plants of the best type—compact, with large substantial foliage and vigorous stems that carry the flowers well clear of the leaves. Swanley is not behind the times with Begonias any more than it is with other things. The best strains producible or procurable are grown there. I need not give a long list of names, but I must mention two delightful varieties that no garden in the country should be without. Neither is new, indeed they have been out long enough to have spread in thousands

of places where they are not seen yet. Their names are Octavie and Rosebud. The former is white, and as beautiful as any Gardenia ever produced. It is charming on the plant, charming in a buttonhole—charming for everything and everywhere. The plant is a compact grower and a free bloomer. There are finer Begonias than this; there is not one more attractive and useful. The other is a gem, too, delightful both in form and colour. A young flower is as dainty as any Rose. I commend Octavie and Rosebud to the notice of every Begonia lover. To be without them is to be deprived of two of the most beautiful of the whole beautiful race.

The Begonia is the flower of the present, the Verbena of the past. One sighs to think of it when entering the long house of them at Swanley, but it is true. Can nothing save them from the oblivion that is coming so rapidly upon them? They are such old friends that they cannot be parted with without regret. Mr. Cannell has clung to them nobly, but even he is driven to contemplate their dismissal. Seeing them as they are grown at Swanley—large, healthy, with huge Phlox-like heads of bloom and delightful colours—rich, tender, and varied—it is sad to think they are going down hill so fast. It is true they are not the best of plants to manage, and perhaps this has had something to do with their decline. No one would be likely to question the beauty of the best varieties, such as those in the Swanley collection, and their perfume is another point in their favour. Acquisition, rosy red; Ball of Fire, brilliant scarlet; Blue Superb, light blue with white eye; Crimson Gem, very rich in colour; Delicata, pale rose; Flambeau, rosy scarlet; Flocon de Neige, white; Lilacina, lilac; Paragon, claret; Purity, white; Rose Perfection, rose, white eye; and Turquoise, violet, are a dozen fine varieties amongst this grand collection.

PLANTS OUT OF DOORS.

It is too early to say much about Chrysanthemums, but if there are any stronger and healthier plants in existence than those at Swanley, or that will yield better cuttings, I should like to see them. To turn to outdoor plants proper, there is a beautiful bed of Foxgloves ranging from 2 to 5 feet high and full of bloom. I was particularly struck with the grand strain of white. Another feature is a splendid bed of Antirrhinums, the strain of these fine old flowers being such as is rarely seen outside a Scottish fancier's garden. The striped and spotted flowers were magnificent. There must have been 1000 spikes of them. They have a body guard of the fine herbaceous plant *Verbascum olympicum*, rearing its huge spikes of yellow bloom to a height of 8 feet or more. This noble perennial is perfectly hardy, and could be utilised with striking effect in many gardens. Dahlias are planted out on a very large scale and look wonderfully well. Robert Cannell, one of the finest Cactus varieties ever introduced, is in strong force. This beautiful variety, which is of perfect Cactus shape as well as very rich and distinct in colour, should be marked "indispensable" by every Dahlia grower. Another most useful and beautiful plant is the new yellow Marguerite, Branching Etoile d'Or, which is of splendid habit and blooms with wonderful freedom.

Mr. Cannell believes in a nursery being to as large an extent as possible self-supporting, and in his establishment box and basket making for packing purposes find regular employment for several hands. He goes a little further, and lets his men fill up time by making show boxes, so that a customer wishing to exhibit cut blooms has no difficulty in obtaining the necessary conveniences. Another "sundry" is the wasp glass represented by the engraving (fig. 8). These are excellent things for suspending in vineries and elsewhere. With a little sweetened beer they provide an excellent trap for wasps and flies.

These are but a fraction of the good things to be seen during a summer visit to Swanley. A writer would need a whole issue of the *Journal* to do the place full justice. But its gates are always open to visitors, and a cordial welcome is extended to all comers. He would be a learned and experienced man who could visit it without deriving some information, for not only is everything of the best, but the culture is of the highest class. Those who find the busy head of the firm with an hour to spare will be fortunate, for those who know Mr. Cannell best respect him as a man of sound common sense, good judgment, and practical knowledge. If he were not, Swanley would not be what it now is—a town of great horticultural importance and prosperity. Few recognise, perhaps, when they read of the vast quantities of fruit and flowers that are sent thence to the markets every year how large is the share that Mr. Cannell has had in centralising horticultural enterprise and industry upon it.—WANDERER.

THE ARTISTIC AND EFFECTIVE ARRANGEMENT OF PLANTS AND FLOWERS.

(Concluded from page 29.)

HAVING thus referred to the schedule compilers, let us now take a look at the show itself. What is the usual feeling experienced? I well know what it is with me; there is an impression of formality running through the whole. At times we have so many hundred flowers of Dahlias set up in prim green painted boxes, not a vestige of foliage visible, and these staged upon lengths of straight tables. At other times we have fine Asters and Zinnias, staged in like manner. Then again, at some shows we have the lovely Carnations, many of which have been mutilated and dressed, set up in paper collars, and staged in the orthodox green box on the straight table. It is a pity these lovely flowers should be thus presented to the public. Where is the artistic to

be found? Take the queen of autumn flowers, the noble Chrysanthemum. How are these flowers presented to us? They are in boxes, and these boxes have to be made to a required size, so many inches long, wide, and high; and if your flowers happen to be large and extra fine, you must crush them into the box. In looking last season at a magnificent lot of flowers, I saw that this ruthless "staging up" had been carried out, and the result may be given in one word—failure. Many other of our lovely flowers are victims to the same treatment. Now, the public look to the horticulturists to lead in the matter of artistic and effective arrangement of plants and flowers. What, I ask, is the object lesson often given in this respect? We must agree that it is not what it should be, to say the least of it. Mind, I am not saying one word about the flowers themselves, because they at most times represent the highest state of cultivation, but it is the way they are presented to the public that I complain about. Specimen flowers of Chrysanthemums lend themselves to artistic treatment. For instance, if I had thirty-six Japanese blooms to set up, and 4 to 5 feet run of table space allowed for the purpose, I would dispense with the green box at once; have the flowers cut with long stalks, varying from 9 inches to 2 feet in length; each flower should be placed in a receptacle, which would hold water and be heavy enough at the base to prevent overturning; the flower should also have some sort of support to maintain it in an erect position. Having the flowers thus prepared a number of suitable foliage plants should be utilised, say light feathery Palms about 3 feet high, to serve as a background. The flowers are then artistically grouped together with the small foliage plants, Maidenhair Ferns, Asparagus, &c., and edged with *Isolepis* and *Panicum*, so that the whole of the table space shall be hidden by this groundwork of plants and Ferns. The

FIG. 8.—TRAPPING WASPS IN VINERIES.

flowers rising from this would present a marked contrast to the formal box style, and I venture to predict that the public would appreciate the change. Of course this will mean a little more work, but I do not think the man who has looked after his plants for nearly twelve months would grudge this. Time will not permit me to go into detail of an artistic setting up of each of the classes of flowers which are usually found staged in the green boxes, but the instance I have given of the Chrysanthemums will give you some idea of a more artistic treatment.

While on this subject of flower shows perhaps I may be allowed incidentally to say a word or two in respect to stove and greenhouse plants in flower. These are usually presented on balloons of faultless shape, and each shoot tied into a mathematically accurate position, forming in my opinion one huge contortion, as useless as it is ugly. Could not these be trained in a more pyramidal form, and the shoots allowed to have a natural sway, not being tied closely in? I remember seeing one such plant at a show, a *Bougainvillea* I think it was. It formed a picture, and favourable comment was freely bestowed upon it. Some plants answer better to this treatment than others, as I am fully aware, but the change to the more natural would be a step in the right direction. The arrangement of groups of plants at exhibitions has in the last few years wonderfully improved. A more natural idea has been followed up; ugly banks of plants are disappearing, and the light and artistic treatment is taking its place. One has only to visit metropolitan or large provincial shows to gain an object lesson, from which more practical knowledge can be gathered in five minutes than could be learned from any amount of paper and books. The arrangement of flowers in baskets, bouquets, vases, &c., at country flower shows exhibits a lack of knowledge of the rudiments of the artistic. Here we find the flowers packed together, jumbled up in inextricable confusion. At some shows at which I have judged I have found great difficulty in awarding the prizes, and after deciding which is the least ugly—for ugly they all are—the first prize has to be bestowed on a most unworthy object. Now how does this act? Simply in this way. The people seem to look upon this first prize ugly thing, be it bouquet, basket, or vase, as an ideal, and next year, when the show comes round, all

strive to copy it. Much good might be done if one could undertake some amount of teaching in this respect, by providing a bouquet, vase, or basket properly and well done to serve as the ideal at which the competitors might aim; this would, I believe, create a taste for the artistic where little now exists.

In making the foregoing remarks I am speaking of the generality of shows, but there are places where the arrangement is excellent. Flowers must be well arranged and colours blended to be well appreciated. In many cases it is not the size of the individual flowers which charm us most, but those that are set up artistically, with care and grace, that claim our attention and praise. With regard to bouquets, wreaths, and designs composed of flowers, we as a nation are well to the fore. Generally speaking, we have an artistic notion of the arrangement, and follow the natural, whilst the Americans work on rather a more formal method. This I feel is creeping on us, but I hope it will not extend; for what beauty there can be in a piano or chair or such like things made of real flowers I cannot imagine. Bouquets or posies of flowers should be made lightly, so that each flower may be easily seen, with no crowding whatever, and foliage should be used to enhance the effect of the flowers, so making what may be termed a lovely bunch of flowers and having a natural appearance.

Up to the present I have dealt more with artistic than effective arrangement, and I now feel it incumbent upon me to give my ideas respecting the latter. When I used the word effective I mean that result which is produced by bold treatment of plants and flowers, by judicious grouping and massing. Many plants gain greatly by being planted in masses. What can be a fairer sight than a bold group of Rhododendrons in full flower, backed up by foliage trees, or a fine bed of Azaleas on a large lawn? This system of massing is often much abused. At times we see masses of one colour, then of another, and another, the result of which is a poor effect, whereas had more foliage been used and the masses of colour placed further apart, a much finer result would have been obtained. When we refer to Nature we cannot but notice how unobtrusively she presents to us her masses of bloom. What a wonderful effect a piece of rustic scenery with a mass of Bluebells, Lily of the Valley, single Narcissus, or Buttercups has. Although it is a mass of bloom it is not crowded and crushed together, or one mass spoiling the effect of another. There should not be a formal appearance to the massed plants, be they what they may. This is a danger which cannot be guarded against too carefully. Where there is plenty of room, say in large grounds around a mansion, I like to see large clumps here and there of Lilies, Roses, Phloxes, Hollyhocks, Foxgloves, Campanulas, Irises, Dahlias, and Sunflowers, each family of plants steering well clear of its neighbours, so as to prevent any clashing. Of flowers that gain by bold treatment we may take the Rose. What a glorious sight is presented by a bank of these flowers similar to those set up at some of our great flower shows. The effect is greatly enhanced by the liberal use of Maidenhair Ferns as a groundwork and fringe to the group. Cut flowers and flowering plants must have Ferns or foliage to show them off to anything like advantage. A box of flowers set up for exhibition has a bare and hard appearance without foliage. Take, again, an exhibition group of Chrysanthemum plants which we frequently see at some of the large autumn shows. It is a mass of flower set up at a perfect angle and a faultless semicircle in shape, but a finer effect would be gained if the exhibitor had a little more space allowed him, and Palms and foliage were employed at the back, and Ferns in front. This would alter the effect of the hard and formal group, and it might then claim to be considered artistic.

Just for one moment I should like to allude to conservatory decoration, and urge a less formal arrangement of the interior. In some instances we have beautiful examples of the artistic and effective arrangement of plants and flowers, and of interiors fitted up in an artistic manner, but more often we have presented the formal stage and straight path. What we want is a miniature landscape garden, as it were, under cover, and to let our plants grow in a more natural form than all in a row of pots. Many of our lovely greenhouse climbers are not grown nearly as much as they should be, nor are the walls utilised to the extent they might be. I have seen some covered with Gloxinias, Begonias, and Ferns presenting a glorious appearance. The peat and loam in which these grow is fixed to the wall by wire netting, the Fern and Lycopodiums seen covering this, and the result is most effective. I plead all round for a less formal and more natural and artistic treatment. I believe there is still much before us in the way of improvement in this phase of horticulture, and it is gratifying to find men striving for it.—G. P.

ROSE SHOW IN DUBLIN.—The Royal Horticultural Society of Ireland's Rose Show was held in Lord Iveagh's grounds on July 7th. There were several handsome prizes in competition. One was a challenge plate, value £24, presented by the horticultural seed trade of Dublin, for thirty-six blooms, and which must be won three times before becoming private property. The Society added £2 in money, also £2 to the second, and £1 to the third. The winner was Mr. Colohan, gardener to D. M. Wilson, Esq., Windsor, Monkstown; Mr. Porter, gardener to Lord Ashtown, Woodlawn, Co. Galway, being second; and J. G. Nutting, Esq.'s gardener third. A challenge cup or piece of plate, value 21 guineas, with £5 added annually, was offered by Hamilton Drummond, Esq. This was won by Mrs. Robertson's gardener, Mr. Porter being second, and Mrs. Tedcastle's gardener third.

EVENTS OF THE WEEK.—The show list for the current week is again a heavy one. To-day (Thursday, July 21st) there are Exhibitions at Highgate, Aylesbury, Barnet, Trentham, and Worksop. On Friday, the 22nd, there are Rose Shows at Ulverston and Manchester, the latter being continued on Saturday. The Northern Show of the National Pink Society is held in conjunction with it. The National Chrysanthemum Society's picnic at Penshurst is also held on Friday. On Saturday, the 23rd, there are Rose Shows at Bedale and New Brighton, the Midlothian Rose and Pansy Exhibition taking place on the same day. Acton Show is fixed for Wednesday, the 27th; and that of the Hesse and Howdenshire Society for the 27th and 28th. There are Rose Shows at Halifax and Southwell on Thursday, the 28th. There will be a sale of Cattleya Victoria Regina and other Orchids at Protheroe & Morris's rooms on Friday, July 22nd.

— **THE WEATHER IN LONDON.**—The weather has been very unsettled during the past week. There were a few local showers on the 16th inst., and on the 17th there was a steady downpour of rain throughout the greater part of the day, the temperature, too, being perceptibly lower. The 18th was fine and bright until evening, when rain fell heavily. On the 19th a barometrical depression of considerable intensity reached London from the north, rain commencing to fall heavily about noon and continuing for the remainder of the day. The weather was cold also. On the morning of the 20th high north-westerly winds prevailed, the weather being cold, changeable, and threatening.

— **ROYAL HORTICULTURAL SOCIETY.**—The next meeting of the Society will be held in the Drill Hall, James Street, Victoria Street, London, S.W., on Tuesday, July 26th. In addition to the ordinary exhibits, the National Carnation and Picotee Society holds its annual Show, in which the special prizes offered by Mr. Martin Smith will be competed for. At 3 P.M., Mr. A. J. Manda of the United States Nurseries, Hextable, Swanley, will give a lecture on "Insect-eating Plants," in connection with which many exhibits are expected.

— **ROYALTY AT EARL'S COURT.**—Their Royal Highnesses Prince and Princess Henry of Battenburg paid a visit to the International Horticultural Exhibition at Earl's Court last Saturday week, and were conducted through the grounds by Mr. Milner. They stayed for some time in the house for insectivorous plants, and had the beauties of the Orchids, Nepenthes, Sarracenias, &c., exhibited by Messrs. B. S. Williams & Son, pointed out by Mr. H. Williams, and they expressed themselves highly gratified with the collection they had seen.

— **A VALUABLE SUMMER CHRYSANTHEMUM.**—At the late Portsmouth Show, held on July 13th, Mr. Agate, Chrysanthemum Nurseries, Havant, obtained a first-class certificate for a seedling Chrysanthemum named Lady Fitzwygram, which is the best of the summer flowering section. It partakes of the character of Avalanche in the flower with perhaps a trifle more looseness in the petals, which are snowy white and about 4 inches in diameter. The habit of growth is everything to be desired, plants now flowering in pots being not more than 1 foot to 15 inches high. It is a decided acquisition where pure white early flowers are in demand.—E. MOLYNEUX.

— **SHEPHERDSWELL HORTICULTURAL SOCIETY.**—At the monthly meeting of the Horticultural Society held on Monday the first prize for a collection of vegetables grown by gentlemen's gardeners was awarded to Mr. W. Golder, gardener to the President (W. J. Smith, Esq.) whose exhibit included an excellent dish of Tomatoes. The second prize was awarded to Mr. W. Ashdown, gardener to K. H. Wills, Esq., who also won a prize for greenhouse plants. The President's prize for the best collection of vegetables grown by a cottager was awarded to Mr. J. Ash. Prizes for vegetables were also awarded to Mr. J. C. yer and Mr. W. Hughes, each of which also won prizes for window plants. Mrs. Smith's prize was awarded to Mr. J. Fox for cut flowers. The Royal Horticultural Society has made a grant to the Shepherdsweil Society of one of its bronze Banksian medals, to be awarded to the cottager whose collective exhibits at the annual Show are considered by the Judges the most meritorious.

— **DR. REGEL'S SUCCESSOR.**—It is announced that the directorship of the Imperial Botanic Garden at St. Petersburg, left vacant by the death of the late Dr. Von Regel, has been assumed by Dr. A. F. Bataline.

— **DEATH OF MR. J. MATTHEWS.**—We learn with regret of the death of Mr. J. Matthews, who, until about six years ago, was head of the well known potteries at Weston-super-Mare, now conducted by Mr. Conway G. Warne. He was in his sixty-seventh year, and was greatly respected by all who knew him.

— **VICTORIAN VINEYARDS.**—Victorian vineyards, says a daily contemporary, now cover nearly 16,000 acres, and turn out over 1,500,000 gallons of wine per annum. No other colony approaches this. It is nearly three times the output of New South Wales. South Australia produces 510,000 gallons from 7,400 acres.

— **THE CAUSE OF COLD SUMMERS.**—Have your readers any notion of the cause of this wintry weather we are experiencing in Lanarkshire? Is it due to warm weather in the far North melting the icebergs and the vapour floating here? Just to show the state of matters our few Apples are no larger than Cherries yet, and many other things make no progress. The severe storms of wind we have had did much damage, and were unprecedented in the memory of the oldest man. —W. T.

— **A RECORD RAINFALL.**—Mr. W. Taylor writes from Bath:—"I send you a cutting from a local paper showing that we have at last had some rain. I do not remember seeing such a downpour. Nearly all of it fell between 2.15 and 4 P.M. We shall be tolerably free from dust the next few days, for it is all washed away." The cutting is as follows:—"The amount of rain which fell on Saturday—that is, throughout the whole day—was, according to the reading at the Institution, 1.680 (or nearly 1½) inch; quite a phenomenal amount for the time of year. The barometer was not much disturbed by the storm, and has since been rising."

— **EDENBRIDGE GARDENING SOCIETY.**—The usual meeting was held on Thursday evening, when there was a good attendance of members, the competition being for professionals, for the best dozen cut Roses, in six varieties. There were eight entries, the first prize being taken by Mr. M. Oliver, the second by Mr. Ware, the third by Mr. Dove, and extra third by Mr. G. Anscombe. The whole of the exhibits were of excellent merit, and made a good show. Mr. E. Boxall read an excellent paper upon the cultivation of Chrysanthemums, which provoked a considerable amount of discussion. Mr. G. Anscombe proposed, seconded by Mr. T. Smith, a hearty vote of thanks to Mr. Boxall for his paper, which was acknowledged.

— **NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION)**—The sixteenth annual Exhibition of the above Society will be held in the Drill Hall of the London Scottish Rifle Volunteers James Street, Westminster, on Tuesday, July 26th. Seventy-four prizes are offered in sixteen classes. Special prizes are also offered for border Carnations by Martin R. Smith, Esq. The Exhibition will be open to visitors at 1 P.M. A luncheon will be provided at the Hotel Windsor adjoining the Hall at 1.30 P.M., for members and their friends. Tickets are 2s. 6d. each. The "Carnation Manual," which has been in preparation for some time, is nearly ready, and will be published by Cassell & Company, Limited, about the first week in August.—JAMES DOUGLAS, *Hon. Secretary*.

— **BALSAMS AT CHISWICK.**—The Paxton house in the Royal Horticultural Society's garden at Chiswick is now very gay with Celosias and Ivy-leaved Pelargoniums, but the chief attraction is the Balsams, which are very fine. The plants have been grown from seed saved from the best plants grown last year from Barr's Criterion strain. Seeds were sown this year very early in May, in heat, and as soon as possible the plants were potted singly into 60's and kept in a temperature of 60° to 75° Fahr. When well rooted the plants were transferred to 48's in a mixture of loam, leaf soil, horse droppings, and sand, and kept in heat near the glass until well established. They were then taken to a cooler house, and as soon as they were hardened they were ready for being finally potted into 24's. With plenty of water (often given four or five times a day) and air they soon become fine healthy vigorous plants, and are now producing quantities of large and very double flowers, the colours ranging from white through pink to ruby and purple. Beyond a rich soil to grow in, these plants have received no stimulants of any kind, and are as fine a batch as one could wish to see.—C. K.

— **CISTUS PURPUREA.**—On a newly-made rockery in the High Street, Winchester, I lately saw this Cistus, and thought what a grand rockery plant it is, growing so dwarf (1 foot) and bushy. The flowers are fully 3 inches in diameter, deep purple in colour, and freely produced. It is one of the best of the genus.—E. M.

— **CELOSIA OR FEATHERED COCKSCOMBS.**—These, as shown at the Bath Rose Show by Messrs. Sutton & Sons, Reading, were worthy of special mention. There was quite a long row of very sturdy plants all having branching plumes of the brightest red and yellow shades. The seed from which these plants were grown was sown late in January, and the plants grown rapidly in a light position and brisk heat. A certificate was awarded, a similar honour being also accorded to the beautiful Gloxinias Her Majesty and Duke of York.

— **DWARF CANNAS.**—A conspicuous feature in the group of miscellaneous plants arranged at the Bath Rose Show, but not for competition, by Messrs. R. Veitch & Son, Exeter, were the dwarf flowering Cannas. For pot culture this race of Cannas are of the greatest value. They are of easy culture, very showy, and continue to flower for several months together. Some of the best were Jules Chrétien, very dwarf, flowers of a deep scarlet colour; Little Jenny, orange, scarlet-edged, spotted with clear yellow, and very effective; Victor Hugo, bright scarlet; Antoine Chantine, orange scarlet, yellow centre; and Alphonse Bouvrier, flowers and spike extra strong, colour deep scarlet.—I.

— **UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.**—The quarterly meeting of this Society was held on Monday evening, July 11th, at the Caledonian Hotel, Mr. Joseph Wheeler in the chair. One new member was elected, making a total in the two quarters of thirty-seven. Sickness among the members has been light during the quarter, two only being on the funds at the present time. The annual dinner will take place the last week in September, due notice of which will be given. It is proposed to present the Treasurer (Mr. James Hudson) with a testimonial on the occasion for his valuable services during the past ten years.

— **THE REPRODUCTION OF FERNS.**—The monthly meeting of the Sheffield, Hallamshire, and West Riding Chrysanthemum Society took place on July 13th, when an interesting display of foliage plants, for which prizes were awarded to professionals and amateurs, formed a feature of the meeting. A short paper by Mr. J. Eadon, on "Reproduction of Ferns," was delivered, in which he traced the progress of knowledge on the subject from the year 1792 to the present time, and explained the best-known methods of obtaining new varieties by cross-fertilisation. An interesting discussion took place afterwards, and the meeting concluded with votes of thanks to the essayist and the Chairman (Mr. J. G. Newsham, also a Fern grower), who added to the interest in the subject by some lucid explanations of difficult points.

— **THE PREVENTION OF POTATO DISEASE.**—Although a number of experiments were made in Great Britain and Ireland last year to test the value of the bouillie bordelaise as a preventive and cure of Potato disease, none of them were carried out in identically the same manner as the successful experiments by Dr. Aimé Girard, the chemist to the French Government, and it has been pointed out more than once in "The Times" that to be of any real value this should be done. It is gratifying to learn that this will be the case in one important series of experiments this year. Messrs. James Carter & Co. have at Bromley, in Kent, a piece of Potatoes, about an acre in extent, in which ten varieties are planted in as many rows, each of which goes the full length of the acre. This they determined to give up for an experiment, and, in order that it should be carried out in M. Girard's method, the whole experiment has been placed in the charge of our agricultural correspondent. The first dressing was given on Monday last, the mixture being applied at the rate of 29 lbs. of sulphate of copper (98 per cent. of purity), 29 lbs. of lime, and 100 gallons of water per acre. The land was divided into four parts of equal size, the first and third being dressed with the mixture and the second and fourth left undressed. The mixture was applied in a fine spray by means of the small knapsack distributor—the anti-pest—the working of which was superintended by the inventor, Mr. G. F. Strawson. The Potatoes, which were planted on April 8th, have at present no appearance of disease, but should any appear in the undressed portion of the field the mixture will be at once applied over a small portion in order to test its powers of checking the disease. The dressed plots will have another dressing later on, and at the time of lifting the results on both the dressed and undressed plots will be carefully noted.—("The Times.")

— **THE POTATO SCAB.**—The Potato "scab" is intelligently discussed in a bulletin from North Dakota, a great Potato-growing region, and a few preventive points given which may save many a crop from partial destruction. It says that scabby seed Potatoes will produce diseased crops; that healthy seed in a soil free from the scab or other diseases will alone give satisfactory results; that the disease germs of the scab often remain in the soil from season to season unless some means are taken to destroy them, and that diseased seed can, by being soaked in prepared solutions of chemicals, be made healthy and free from all taint. Corrosive sublimate has so far proved the most effectual for this work, and 2 ozs. of the poison in 2 gallons of hot water is the proper proportion. This should be stirred thoroughly, and then poured in a barrel containing 13 gallons of water. The seeds can be immersed in this for half an hour, then dried and cut up for planting. The solution can be used several times.

— **FRUIT AND VEGETABLES AT BEDFORD.**—The former as stated by a correspondent who favoured us with a report of the Rose Show on page 62 was remarkably good. Mr. G. R. Allis, gardener to Major Shuttleworth, Old Warden Park, was first for a fine basket, Pines excluded, and Mr. Empson second; Mr. Empson leading for black and white Grapes and for a Melon, his bunches of Madresfield Court and Foster's Seedling being evidently the produce of Vines in the highest state of perfection. Mr. Allis showed some fine specimens of Waterloo, Latest of All, and Oxonian (Eleanor) Strawberries, obtaining first for three varieties and also for very fine Royal George Peaches. Vegetables were generally good, but Potatoes hardly up to the usual Bedford standard, Mr. G. Robinson gaining first for the collection of twelve kinds, and also taking Messrs. Sutton's prizes for six varieties and for six dishes of Potatoes and also for a collection of Salad. Mr. W. Kingston, Bedford, secured first prize in both classes for collections of Peas, staging Alderman (very fine), Duke of Albany, Duchess, Stratagem, Autocrat, and Charmer. Mr. Allis was first with twenty-four pods of Alderman in a strong competition.

— **DEVON AND EXETER GARDENERS' ASSOCIATION.**—The Exeter Gardeners' Association formed last year now numbers a hundred members. They meet in the winter months, but they decided some time ago to have a summer meeting in order to visit some of the more notable gardens in the neighbourhood. This event took place recently, when about seventy of the members turned up, amongst them being fifty-five practical gardeners, and the others being amateurs and honorary members of the Association. The places chosen for the visit were Winslade, the seat of the Rev. A. W. Hamilton Gell; Bystock, the seat of Mr. J. P. Bryce; and Bicton, the seat of the Hon. Mark Rolle. At a dinner subsequently held the chair was taken by Mr. Andrew Hope, who discharged the duties of the position with his customary efficiency and geniality. At the conclusion of the repast the loyal toasts were honoured, after which the Chairman proposed "Success to the Association." He explained how the Association was started, stating that the idea originated with his co-secretary, Mr. T. E. Bartlett. It had worked most satisfactorily, and great benefit had resulted from it. They had already over one hundred members, and there was a balance in hand at the end of that, their first season, of £10.

— **ARSENIC AS AN INSECTICIDE.**—A bulletin from the Iowa Agricultural Experiment Station treats upon the use of various forms of arsenic, and in various ways as an insecticide, and their effects upon the foliage. The conclusions which they give we condense. The oldest leaves and those affected by a fungus disease are more susceptible to injury than young or healthy leaves. Dews and probably direct sunlight increase the injury done to the foliage, but applications made in bright sunlight or in the heat of the day do no more injury than those made in the cool of the day. Showers after application lessen the liability of injury to the foliage. When freshly mixed, London purple is most and white arsenic least injurious to the foliage, but if the arsenic stands long in the water before using it will do much greater injury than when freshly mixed. Lime added to arsenic when first mixed causes it to injure the foliage more, but when in solution, as when London purple or Paris green is used, it does not affect the foliage as much. London purple can be used eight or ten times as strong without affecting the foliage if the Bordeaux mixture is used with it. All the arsenites mix with resin compounds and with carbonate of copper solutions, and do no more harm than when mixed with water alone, but in sulphate of copper solution they injure the foliage much more, and so they do in soapy solutions. They do not mix readily with kerosene emulsions.

— **FRUIT GROWING AT THE CAPE OF GOOD HOPE.**—A circular has been issued by the Agent General for the Cape of Good Hope, 112, Victoria Street, London, S.W., giving information with respect to fruit growing on a large scale at the Cape. Under certain specified conditions it is pointed out that there are good openings for fruit farmers. The following extract from the report of Mr. P. Macowan, F.L.S., the Government botanist, is significant, but we are not guiltless in respect to this matter. "The quality of fruit marketed is largely deteriorated by want of enterprise in arranging for its proper packing and transit. It is shaken down and tumbled into old gin cases and the like for jolting to market, hence it must be only three-quarters ripe to bear the rough usage without being turned to unsaleable pulp. Grapes are sent by tolerably careful growers in small baskets and arrive fairly well. The ordinary small farmer is satisfied with piling the bunches loose in the back of his cart till he has perhaps a hundredweight or more, and this mass he hawks about town as if it could be called fruit for the table. Of late years a very few of the leading growers pack their choice fruit, after selection and grading to size, in baskets and boxes containing a given number according to name and sample. But this care is quite exceptional; and the average fruitist here has yet to learn the first principles of marketing his produce. I cannot more suggestively point out the crude conditions of supply than by quoting the common phrase among sellers that 'spare' the fruit to the customer."

— **BRIGHTON AND SUSSEX NEW HORTICULTURAL AND MUTUAL IMPROVEMENT SOCIETY.**—At a largely attended meeting of the above Society, Mr. Balchin in the chair, a letter from the Committee of the Chrysanthemum Society was read, to the effect that they were in favour of the amalgamation of the two Societies at the end of the financial year; and it was resolved that the joint Committee meet at the Imperial Hotel on Thursday evening, the 21st inst., to discuss details. Fifteen new members were elected. Some interesting exhibits brought by members were on the table, amongst which were some branches of Red and White Currants by Mr. E. Bunney of Coneyborrow, showing an immense crop of fine large fruit. From Hassocks Nurseries some sprays of Orchids were shown, Mr. Richardson, Messrs. Balchin's manager, intimating that they had all been subjected, during the winter months, to a much lower temperature than was generally supposed necessary for their successful culture, and that, if kept rather dry, many others can be grown under the same treatment. Mr. J. Bunney of Danny Park had a collection of early vegetables, and made some excellent remarks upon their good points. Mr. R. Miller of Shoreham handed round a pot of Strawberry jam, with a spoon to taste it. It was made from fruit gathered in a soaking rain in July, 1889, and has kept till now quite sound. The whole proceedings show that the gardeners and amateurs of Brighton have taken up with spirit the work of mutual improvement.—R. I.

— **COMMON CARNATIONS.**—An hour or two before I read Mr. Martin Smith's criticism of my note on common Carnations in a recent issue I came upon a wayside garden in which there were spreading masses of Pinks nearly a yard across and laden with flowers. They were common border varieties every one, most of them single, but their myriad tender-hued blossoms filled the place with brightness and the air around with perfume. I thought that in no great garden which I had ever entered had I seen a display of flower beauty more glorious than that which surrounded this cottage home. They reminded me of another garden in which, later in the year, Carnations are to my mind a dream of beauty, but they are of the same untutored race; and of yet another garden wherein Roses are grown, that in spite of their wealth of bloom no exhibition box ever contains. Florists see no beauty in such types as these, but all are not so blind. The choice varieties are beautiful too, but they serve a different purpose. I do not depreciate them, but on the contrary I admire them deeply and hope to see their culture widely extend. There is not one of them, however, which I have grown or seen that can vie with the common border varieties I have in my mind for freedom of growth and flowering. Plants that seem almost as full of flowers as a sheaf of corn commend themselves to me as generous, graceful and beautiful. If each individual flower is not up to the florist's standard, what matters it? Mr. Martin Smith would make the difference between the types a question of good and bad. I deplore such a view being taken. They serve different purposes altogether, and each is good in its way. As it is Rose time let me take an instance from the queen of flowers. If I want blooms for the exhibition board I dare not forget Souvenir d'Elise, if for a wall in the free air I look beyond it to Gloire de Dijon.—P.

— POTASH AND WIREWORMS.—Although the New York Experiment Station found no advantage in using potash to kill wireworms, the New Jersey Experiment Station reports that on a farm in Somerset, N.J., a 14 acre field was divided into two sections, one being fertilised with muriate of potash, and the other with kainit, a strip of seven rows being left between without anything to make the test more perfect. The whole land was known to be badly infested by wireworms and cutworms. On the part where the kainit was used the corn came up well, and was not molested by insects at all. Where the muriate was used there was but little injury, but on the strip between, where neither was used, which run the whole length of the field, the crop was almost entirely destroyed by the worms. This was not intended as a test of the effect of these fertilisers in killing or driving away worms, but its effects were so marked that the owner could not help noticing them.—(*American Cultivator*.)

HORTICULTURAL SHOWS.

WOLVERHAMPTON.

AS was intimated last week, this extensive Show demanded further reference than could be given then. The chief prizewinners in the open Rose and fruit classes were given on page 41, and the winning varieties of Roses are recorded on page 65 of the present issue. The Exhibition was the fourth that has been held under the present able and energetic Committee, and was remarkable for its extent and diversity, five very large marquees being requisite for the accommodation of the exhibits. With fine weather the Wolverhampton Shows are well patronised. No fewer than 70,000 persons attended last year, but we have not heard the number of visitors to the Show last week. We now give a necessarily compressed report of the plant and other classes.

The prizes of £20, £15, and £10 brought out Mr. Cypher and Mr. Finch, gardener to Mr. Alderman Marriott of Coventry, and here, as at Shrewsbury, both exerted their strength, and made grand displays of specimen plants. Mr. Cypher was a good first with splendid plants, amongst them being fine examples of *Ixora Reginae* and *Williamsi*, *Erica ferruginea major*, *Kalosanthes coccinea*, *Anthurium Schertzerianum major*, with grand spathes; a splendid *Bougainvillea*, and a monster *Croton angustifolius* in superb colour. Mr. Finch was a capital second, and Mr. Currie a somewhat distant third. For six plants in flower Mr. Cypher was again first with very fine specimens of *Phenocoma prolifera Barnesi*, *Allamanda nobilis*, *Bougainvillea glabra*, *Stephanotis floribunda*, *Ixora Reginae*, and *Erica Parmenteri rosea*, all most difficult to beat. Ferns and fine-foliage plants were plentiful and of first-class quality.

In the class for eight exotic Orchids Mr. Cypher was first with grand plants of *Cattleyas Leopoldi* and *Gaskelliana*, *Dendrobium filiforme* and *Dendrobium infundibulum*, *Lælia purpurata*, *Anguloa Clowesi*, *Cypripedium Curtisi*, and *Oncidium macranthum*.

Four groups were arranged in the class for not exceeding 450 square feet. Here Mr. Cypher was also first with a very fine group of an irregular outline, a very pleasing general arrangement. Second, Mr. W. H. Dyer, gardener to Mrs. Marigold. Third, Mr. J. E. Knight, nurseryman, Wolverhampton. Fourth, Mr. Currie.

There was a section for gentlemen's gardeners in Staffordshire and the adjacent counties. In the class for six stove and greenhouse plants, Mr. Finch was first with *Erica Parmenteri rosea*, *Ixora salicifolia*, a *Bougainvillea*, and three splendid Palms. Mr. Dyer was second with very fine *Kalosanthes coccinea*, *Clerodendron Balfourianum*, *Allamanda Hendersoni*, *Dipladenia crassinode*, and two large Palms. For six Orchids Mr. Finch set up some excellent specimens, and easily won the first prize with *Sobralia macrantha*, 3 feet through, dwarf and superbly bloomed; *Vanda suavis*, *Cypripedium barbatum*, *Dendrobium Deari*, *D. suavisimum*, and *Lælia purpurata*. Second, Mr. Powell, gardener to G. H. Kenrick, Esq., Birmingham, with fine specimens.

Zonal Pelargoniums made a brilliant display, and Fuchsias, Coleuses, and other plants, especially Tuberous Begonias, were well represented.

For six Begonias, J. E. Underhill, Esq., was first with some well grown plants, averaging 1½ to 2 feet through, of fine sorts well flowered, and the same exhibitor scored heavily with a collection of well done Gloxinias. In this section, Mr. Powell, gardener to G. H. Kenrick, Esq., was first for a group of much beauty and taste in arrangement. The cut flowers in this section were well represented, and there was only one class for fruits. For a collection of vegetables, not less than eight varieties, Mr. Coombes, Himley Gardens, was first with nine varieties, all first class, and Major Williams second.

The amateur classes, some twenty-four, for those who do not keep a gardener and reside within ten miles of Wolverhampton, were well filled with about eighty exhibits, and the cottagers' twenty-nine classes were represented by over 150 entries, many of the vegetables especially being good. Liberal extra special prizes are offered here by the great seed firms for vegetables. Messrs Webb & Sons' prize for a collection of vegetables, was well competed for. First, Mr. Wilkins, gardener to Lady Guest. Second, Mr. Waite, gardener to the Hon. W. P. Talbot. Third, Mr. Meakin. For Messrs. Carter & Co.'s prizes for collections, first, Mr. Waite. Second, Mr. Wilkins. Third, Mr. Milner, gardener to Miss Talbot. For Messrs. Sutton's prizes for collections, first, Mr. Waite. Second, Mr. Wilkins. Third, Mr. McIndoe, Hutton Hall Gardens.

Miscellaneous exhibits were also very numerous. Messrs. Birkenhead had a very extensive collection of Ferns; Messrs. Webb & Sons a large

display of vegetables; Messrs. Sutton & Sons, Reading, a very large display of Gloxinias, including several plants of Her Majesty, their superb new white, to which a certificate was awarded; several plants of their exquisitely netted strain; and plants of Duke of York, a wonderfully fine variety, rich scarlet with a distinctly marked band of white and of the most perfect form, to which a certificate was awarded. Messrs. Sutton & Sons also staged some excellent dwarf Cockscombs and dwarf Celosias. Messrs. H. Cannell & Sons had a fine display of blooms of double Begonias, chiefly seedlings, very fine in quality, prettily set up in spray form. Mrs. George Boyson and Mrs. Cornwallis West were greatly admired amongst others. Messrs. Thomson, Birmingham, had two good stands of Carnation and Picotee blooms, a good display of Violas, and other flowers; Messrs. Hewitt & Co., Birmingham, a large display of cut herbaceous plants, a stand of Malmaison and Germania Carnation blooms, and a fine lot of double and single Begonia blooms; and Messrs. Cliban & Sons cut hardy herbaceous and other flowers. Messrs. Cutbush & Sons had also a collection of miscellaneous plants. Messrs. Perkins & Sons, Coventry, took the lead in the bouquet classes.

Much praise is due to Mr. Green and his son for their excellent work in connection with the Show. The park is in admirable condition, rich in floral beauty, the long curving border lines of Violas having an imposing effect.

A new feature was added to the general Show, on the third day, in the form of special prizes in the open classes. For twenty-four distinct varieties of garden decorative Roses staged in bunches, and for twelve bunches also, Messrs. G. Cooling of Bath were well first with a surprisingly charming display including many very old kinds, such as the old common China, Moss Lanei, Felicité Perpetué, Noisette Aimée Vibert, N. Jaune Desprez, La Neige, Gloria Mundi, Crested Moss, York and Lancaster, Common Moss, L'Idéale, two grand bunches, striking in colour; Paul's Single White, very charming indeed; Papillot, Paul's Single Crimson, very fine; Céline Forestier, Pepita, Pissardi, Gloire des Polyanthes, W. Allan Richardson, Mignonette, Mrs. Bosanquet, and others. Mr. J. Townsend was second for twenty-four varieties, having in this stand fine bunches of Crested Moss, or Provence, and *Rugosa himalayensis*, very fine. Messrs. Cooling were also first for twelve varieties of these garden Roses, with a grand cluster of L'Idéale, Paul's Cheshunt Scarlet, Double Scarlet Sweet Briar, Noisette Lamarque, Old China (?) Fellenberg, and *rugosa* varieties. Mr. Coombes, The Gardens, Himley, was an excellent second with fine bunches, amongst them the Old Hybrid China fulgens, also William Allan Richardson in fine condition. These varieties appeared to excite more admiration, from ladies especially, than many of the ordinary exhibits, and to a great many they were a surprise.

PINK SHOW.—The Midland meeting of the National Pink Society was held in connection with the Exhibition. In the class for twelve blooms of laced Pinks, dissimilar, first Mr. A. R. Brown, florist, Handsworth, Birmingham, with Fellowes's Jeannette, heavily laced, bright in colour, and of full size; Amy (Brown's), a superb bloom of this very fine variety, really the best Pink in cultivation (this bloom also took the premier for purple laced); Minerva, an improvement on Bertram, Boiard, Ethel (Brown's), very fine; Modesty, also very fine; Maclean's Ernest, Empress of India, very fine; Paul's Bertha, Harry Hooper, Campbell's R. L. Hector, a new and promising variety; and a very fine bloom of Thomas Godfrey. Second, Mr. C. F. Thurstan, Wolverhampton, with a very fine bloom of Duke of York, a great improvement on Boiard, a well built flower and very bright, but deep in colour (this bloom also took the premier in the red-laced class); Duchess of Fife (Thurstan's), much lighter in colour than Modesty and looks like a seedling from it, the lacing somewhat irregular, but very distinct and striking; a fine bloom of Modesty, Ada Louise, James Thurstan, and others. In the class for twelve blooms, not less than six varieties, Mr. Brown was again first with a grand bloom of Amy, Boiard, Ethel, Ernest, fine in colour and form; Bertram, Minerva, Godfrey, and a very fine bloom of Empress of India. Second, Mr. R. Sydenham, who had in his stand a fine bloom of Boiard, Hooper's Ne Plus Ultra, which is very like Boiard; and a very pretty bloom of Modesty. Third, Mr. Thurstan, who had good blooms of Duke of York and Modesty.

In the class for six blooms of laced Pinks, dissimilar, Mr. Brown was first with Amy, Ada Louise, Minerva, very fine; Ophelia, Bertha, and Empress of India. Second, Mr. C. F. Thurstan, a fine bloom of Modesty being in his stand. Third, Mr. Sydenham. Fourth, Messrs. Thomson & Co. Fifth, Mr. Thurstan, Cardiff. For six blooms, not less than three varieties, first, Mr. Brown with Minerva, very fine; Bertram, Rev. L. Hector, Rosy Morn, and two blooms of Amy, one especially fine. Second, Mr. C. F. Thurstan. Third, Mr. Samuel Barlow. Fourth, Mr. J. Jester, West Bromwich. Fifth, Mr. Sydenham. In the class for six blooms, not less than three varieties, first, Mr. Jester with Boiard, John Lowe, well marked but thin, and another. Single bloom, purple laced.—First, Mr. Brown with a fine bloom of Amy. Single bloom, red laced.—First, Mr. Brown with Empress of India and second with Bertram. Third, Mr. Thurstan with Eurydice. For six bunches of border Pinks Mr. Thomas Walkden was first with a nicely set up collection.

ROYAL CALEDONIAN, EDINBURGH.—JULY 12TH AND 13TH.

THE area of the Waverley Market was only thinly furnished with tables on the occasion of the Summer Show of the above Society. Roses ought to have been a feature, but the weather north this season was against them so entirely that not a large number were present, and the

majority were deficient in size. Mr. Hugh Dickson, Belfast, carried off most of the first prizes in the trade classes, but even in Ulster, judging by the blooms from this firm, the Roses have had a bad summer. Messrs. Croall & Son, Dundee, followed the Belfast grower, and they relied mainly on Teas, which, though small, were neat. This firm was also first in the Tea class. The gardener and amateur sections call for no particular comment.

Grapes were the noteworthy feature, and never have better or a larger number of bunches been set up at a summer meeting of this Society. The chief items were four bunches from Mr. Smith, Oxenford Castle, to which the first prize was given. This consisted of two well ripened clusters of Buckland Sweetwater and of Black Hamburg. Mr. Murray, Polmont, was second. The same exhibitor was first with two fine bunches of Madresfield Court, with two Black Hamburg, of which there were a large number of excellent examples, and with two Bowood Muscat, large but green. Mr. Boyd, Callender House, Falkirk, was the sole exhibitor of a collection of fruit, and in the classes for Pine Apples, Figs, Peaches, Nectarines, and Strawberries there was only slight competition. Mr. Allan, Gunton Park, had boxes of his seedling Strawberries, Lord Suffield and Gunton Park, and to these a "highly commended" ticket was attached. Of vegetables there were hardly any. Orchids were only sparsely represented, but comprised some good specimens of *Vanda suavis*, several *Odontoglossums*, and a few *Cattleyas*.

Some of the most interesting exhibits were to be found in the trade collections. That of Mr. D. W. Thomson was chiefly stove and greenhouse plants. Messrs. R. B. Laird & Sons had a table of the same kind. Messrs. Laird and Mather of Kelso struck out a new line with a handsome group of Malmaison Carnations in pots, supplemented with baskets of Germania blooms and boxes of Malmaisons. They also exhibited for the first time a new border Carnation named Lady Nina Balfour. The colour is a peculiar shade of soft rose, and the flower is very sweet. A first-class certificate was awarded. Messrs. Cocker & Sons, Aberdeen, staged, among other things, an excellent assortment of herbaceous and alpine flowers. These attracted much attention. Messrs. Dobbie of Rothesay had a representative collection of Violas, showing dozens of sorts. P. Barr, yellow; Queen of Scots, deep blue; Peacock, indescribable as to shade; Rothes, deep yellow; and Max Kolb, intense purple blue, are some examples of pleasing kinds.

MALDON.

THE eighteenth annual Exhibition of the Maldon Horticultural Society was held on Wednesday, the 13th inst., in the grounds of Maldon Hall, and proved in every way equal to its predecessors. The fruit and vegetable classes appear to be the chief feature at Maldon. Plants are not quite so numerous.

In class 1, a group of plants arranged for effect, Mr. E. Smee, gardener to O. Parker, Esq., Woodham Mortimer, secured first position with a very attractively arranged group, consisting of Palms, Ferns, white Phlox, *Asparagus plumosus*, and edged very tastefully with Ferns. Mr. Saltmarsh, gardener to Miss Hart, Maldon, was second with a heavier arrangement, containing a fine plant of *Crassula coccinea*, *Liliums*, *Begonias*, Palms, and Ferns. Mr. J. W. Samms, an amateur, was third. He is to be congratulated on his group; the *Begonias* employed were specially good. Zonal *Pelargoniums* were not quite so keenly contested as usual. First, Mr. W. Pyman; second, Mr. Ballard; third, Mr. Thorogood. *Coleuses* were fairly represented, Mr. R. Seabrooke leading with well grown plants; Messrs. Thorogood and Pyman following in the order named. Ivy-leaved *Pelargoniums* were not strongly represented, Messrs. Piggot, Pyman, and Saltmarsh being the prizewinners. With four Ferns, distinct, Mr. Smee was first, showing good *Asplenium bulbiferum*, *Pteris tremula* and *collina*; Miss Sears taking second position with a good *Davallia Mooreana*, *Adiantums*, &c. *Petunias* were well flowered, Messrs. Pyman and Saltmarsh taking the prizes in the order named. *Begonias* were particularly good. With single varieties Mr. J. W. Samms was clearly ahead; Mr. Ballard was second with smaller plants. Double varieties again found Mr. Samms leading.

With stove or greenhouse plants Mr. Saltmarsh was first with a good *Crassula*, *Fuchsia Frau Emma Topfer*, and *Hoya carnosae*. Mr. Samms was second with a fine plant of *Bougainvillea Alfred Neuner*, *Bougainvillea*, and *Begonia*. Plants for table decoration.—First, Mr. S. Moore, gardener to Bishop Claughton, Danbury Palace, with very good *Dracænas*, *Crotons*, and Palms, Messrs. Seabrooke and Samms taking the other prizes. *Gloxinias* were not very strong. Plants for beauty of foliage found Mr. Moore first with *Crotons*, *Acalypha*, and *Ficus*, Mr. Samms being second with good *Aralia Veitchii*, *Dracænas*, and *Grevillea*. Mr. Smee was third. For a single specimen plant Mr. Smee was first with a good *Dracæna*, Mr. Samms second with an excellent *Kentia*, Mr. Seabrooke third with a good *Araucaria*. Baskets of plants were quite a feature, Mr. Moore clearly leading with a tastefully arranged basket, Messrs. Saltmarsh and Seabrooke following in the order named. Class 18, for eighteen cut Roses, brought good competition. Mr. Smee was awarded first prize for good Mrs. J. Laing, L'Idéale, and Baroness Rothschild, Messrs. Pyman and Kerry being second and third respectively. In the twelve the competition was also well fought, Messrs. Moore, Saltmarsh, and Kerry proving successful. Zonal *Pelargoniums* made an excellent display. The Committee should make exhibitors label the varieties. First, Mr. Saltmarsh, with a very even stand; second, Mr. Smee, very little behind. In the class for hardy flowers Mr. Smee was first, showing good bunches of *Alstroemeria*, *Lychnis*, *Gaillardias*, and *Liliums*. Second, Miss Clear. Third, Mr. Thorogood. Bouquets had a good

entry. First, Mr. Smee, clearly ahead; Messrs. Moore and Pyman taking the other prizes.

Fruit classes were all well filled, the entries in the Currant, Strawberry, and Raspberry classes were very heavy indeed. Mr. Moore won with a collection of fruit, showing creditable dishes of Grapes, Melons, and Cherries. Mr. Smee was second with good Melons, Strawberries, and Cherries. Third, Mr. J. T. Rolfe with black Grapes. Mr. Moore was again first with well coloured bunches. Second, Mr. Seabrooke. Third, Mr. Rolfe. The Currants were the finest the Journal representative has ever seen, the quality was sustained throughout the classes. Tomatoes were excellent. In the vegetable classes Potatoes and Peas were the most notable features, especially the latter; the whole of the classes were well filled. Numerous classes were provided for cottagers, their vegetables and outdoor fruit being quite equal to that in the open classes. Some classes had twenty entries. The whole Show was a success and appeared to be well patronised.

PORTSMOUTH.—JULY 13TH, 14TH AND 15TH.

WITH the laudable object of assisting local charities an annual Exhibition is held in the Victoria Park in this famous southern port. The site is an excellent one, being convenient to exhibitors and public alike, and being situated in the heart of the town is easily accessible to the flower-loving public of Portsmouth, and as popular prices are here considered the most satisfactory it is not surprising that the attendance is large as a rule. The management is undertaken by a strong Committee, consisting mainly of members of the Town Council, with the Mayor, Alderman T. Scott Foster, as their Chairman, and Mr. B. Miller as Secretary. The arrangements, as is always the case here, were perfect, and as handsome prizes are offered, a capital Exhibition was the result.

Plants.—These being in the ascendancy both for numbers and general good quality they deserve a first notice. The principal class was that for twelve stove or greenhouse varieties, distinct, not less than six in bloom. Prizes of £12 10s., £7 10s., and £5 were offered, inducing four competitors to take part, making in all a grand display. Mr. Offer, gardener to J. Warren, Esq., Handcross Park, Crawley, was an easy first, so good were his flowering plants, and the general good quality displayed by the foliage specimens. *Ixora Williamsii*, 5 feet in diameter, *Statice Gilbertii*, *Dipladenia amabilis*, *Erica Candolleana*, *Dracophyllum gracile*, with *Crotons Warreni* and *Prince of Wales* (very rich), and *princeps*, and *Cycas revoluta*, showed to the greatest advantage. Mr. T. Portnell, gardener to Sir A. Lamb, Bart., Beauport, Battle, Sussex, was a good second, *Kalosanthes coccinea*, *Bougainvillea glabra*, and *Erica Parmenteriana rosea* were seen to great advantage in this collection. Mr. F. Mould, nurseryman, Pewsey, Wilts, was third. £5 was offered as first prize for four specimens which brought five entries. Mr. Offer was again an easy winner; in his collection was a magnificently coloured example of *Croton Sunset*, and a freely flowered *Erica Shannoni glabra*. Mr. Wills, florist, Winchester Road, Shirley, was second, *Clerodendron Balfourianum* being especially noteworthy, Mr. Portnell coming next.

Specimen Palms produced a good effect arranged down the centre of a large tent, the restrictions being that they should not be less than 6 feet high, which is a point to be commended when the embellishment of the tents is considered. Mr. Offer was invincible, showing well such kinds as *Kentia Belmorcana*, *Lantana borbonica*, and *Phoenix tenuis*; Mr. W. Peel, gardener to Miss Todd, Sidford Lodge, Shirley, second; Mr. Wills third. For one Palm Mr. Offer easily led with a grand specimen of *Kentia Canterburyana*, the picture of health and fully 15 feet high; Mr. Peel second. Exotic Ferns were few in number, but the quality was superb. For three, Mr. Offer easily gained the leading position with large and perfect specimens of *Nephrolepis davallioides furcans*, *Davallia Mooreana*, and *D. polyantha*; Mr. Peel followed closely. Mr. Offer won for one specimen Tree Fern, not less than 5 feet high, with *Cyathea dealbata*; Mr. Portnell followed with *Dicksonia squarrosa*. The single specimen flowering plants were only of moderate quality, except Mr. Offer's *Erica magnifica*, which had no difficulty in securing first place; Mr. Mould second. Specimen foliage plants showed an improvement. Mr. Offer led with *Croton undulatus*, fully 7 feet in diameter, and rich in colour; Mr. Peel, with *Croton Queen Victoria*, occupied the second place; Mr. Hunt, gardener to Sir W. Pink, Shrover Hall, Cosham, was third with *Acalypha musaica*, a plant not often seen in the exhibition tent in large size. *Coleus* made a large display. Mr. S. Dee, gardener to Mrs. Mills, Crescent Villa, Kingston, was the most successful, followed by Mr. Hatch, gardener to the Victoria Park Committee, Portsmouth. *Fuchsias* were small, but freely flowered, Mr. Hatch staging the best. Mr. Wills had the premier award for six *Begonias* with fairly good specimens; Mr. Hatch second. Zonal *Pelargoniums* in six varieties made a bright display, Mr. Burridge, North End, coming in first easily. Plants for dinner table decoration were good, Mr. Wills taking first honours for six; Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rooksbury Park, Wickham, second. *Gloxinias* appear to be well grown in the neighbourhood. For six Mr. Hatch was closely followed by Mr. Hunt for the chief prize, the plants being freely flowered and of good quality.

Handsome prizes were given for groups of plants arranged for effect in a semicircle. In the large class Mr. Wills was the most successful, having suitable material, and disposing of it without an approach to overcrowding, which is very often a fault in classes of this kind. Mr. Peel was a good second; this group lacked colour rather, though some suitably grown plants of *Francoa ramosa* showed to advantage. Mr. Hewit third. In a similar class, and a trifle smaller was confined to

Portsea Island only, there was spirited competition, Mr. Hatch leading with a neat evenly balanced group tastefully arranged. Mr. Burridge second. Mr. Kimber, gardener to the Asylum Committee, Portsmouth, was third.

Cut flowers were not staged in extra large numbers, yet there were sufficient to make a creditable display. In the classes for ball and bridal bouquets Messrs. Perkins & Sons, Coventry, were invincible, Mr. Burridge taking second place in each class. For twelve bunches of stove and greenhouse flowers, Mr. T. Wilkins, gardener to Lady Theodora Guest, Inwood House, Henstridge, Blandford, was placed first with a choice collection, Mr. Peel following. For the same number of hardy kinds Mr. Ladhams, florist, Shirley, was an easy first; so good were they that the most prominent varieties may with advantage be

Mr. P. Edwards, gardener to Lady Erle, The Grange, Liphook, and Mr. Inglefield were awarded equal third, the former staging Mrs. Pince in good condition, and the latter examples of Black Hamburgh perfect in every way but size. Mr. N. Molyneux was more successful in the class for three bunches of white Grapes, taking first honours with faultless bunches of Buckland Sweetwater. Messrs. Edwards and Inglefield followed in the order named, both depending upon Muscat of Alexandria. Mr. Inglefield had the best Peaches and Nectarines, staging Royal George and Lord Napier, both fine. Very fine early Bigarreau Cherries won for Mr. Hall, gardener to S. Montagu, Esq., M.P., South Stoneham House, Southampton, the premier award. The best green flesh Melon—Hero of Lockinge—was staged by Mr. Inglefield. The best scarlet flesh variety was Invincible from Mr. Dundas Graham, Chitley.

FIG. 9.—CŒLOGYNE SANDERIANA. (See page 51.)

given—*Delphinium nudicaule*, *Aquilegia Skinneri*, *Gaillardia Rossini*, *Catananche cœrulea alba*, *Monarda didyma*, *Eryngium amethystinum*, and *Delphinium hybridum* Ladleiss. Messrs. W. & J. F. Legg, Bury Road Nursery, Gosport, second; Mr. Wilkins third.

Fruit was of more than average quality, especially the Grapes, which were excellent. For a collection of six dishes, Pines excluded, there was but one entry, but so good in quality was it that the first prize was awarded to Mr. Inglefield, gardener to Sir J. Kelk, Bart., Tedworth, Marlborough, who had medium-sized well-finished bunches of Black Hamburgh and Muscat of Alexandria Grapes, Tedworth Favourite Melon, Royal George Peaches, Lord Napier Nectarine, and Brown Turkey Figs in superb condition. For three bunches of black Grapes six competed, the best coming from Mr. J. Tavener, gardener to Sir A. K. Macdonald, Woolmer, Liphook—Black Hamburgh large in bunch and berry. Mr. N. Molyneux was a very close second, his bunches being more even in size and symmetrical, but just a shade short in colour.

Vegetables were exhibited in large numbers and of good quality, Mr. Wilkins leading with a collection of nine sorts; Sutton's Seedling Potato, Perfection Tomato, Improvement Onion, Model Carrot, and Canadian Wonder Bean were the most noteworthy. Mr. Inglefield was second, and Mr. Hunt a close third. Cucumbers were fully represented, Mr. G. B. Woodward, Liphook, having the best brace. Mr. Hall, in a brisk competition, staged the finest Tomatoes—Perfection.

Messrs. Ewing, Havant Nurseries, had about ten dozen Rose and an interesting collection of ornamental shrubs in a cut state. Messrs. Keynes, Williams, & Co., Salisbury, sent twelve dozen Rose blooms containing most of the leading varieties in perfect condition; an exhibit which attracted much attention. Mr. Ladhams, florist, Shirley, had a large collection of hardy herbaceous cut flowers, comprising such as *Campanula platyodon grandiflora*, and *C. p. g. alba*, very showy members of an already extensive genus, *Delphinium nudicaule*, *Gaillardia Vivian Grey*, *Delphinium album*, and *Helenium magnificum*. This and the

previously named exhibits were not for competition, but added considerably to the attractiveness of the Show. Mr. J. Agate obtained a first-class certificate for *Chrysanthemum Lady Fitzwygram*, which is referred to elsewhere.

WALTHAM ABBEY.—JULY 16TH.

THE seventh annual Exhibition was held at Waltham Abbey on Saturday 16th inst. The Exhibition excelled all the previous efforts of the Executive Committee, and must now be regarded as one of the best shows held in West Essex. Plants were a grand feature and occupied the whole of a large tent.

Taking the classes in the open division as they appear in the schedule, the first provided for a group of plants arranged for effect; here Mr. Ayling, gardener to A. J. Hollington, Esq., Enfield, proved the victor, putting up a group of Orchids, backed by Palms, the ground-work being Maidenhair Ferns. The best Orchids were *Cattleyas Mendeli*, *Gaskelliana*, *Mossiae*, *gigas*, and *Sanderiana*, *Laelia elegans*, *Oncidium Marshallianum*, and *O. macranthum*. This group was exquisite. Mr. Nicholsson, gardener to Captain Melles, was a good second, using more foliage plants, *Crotons*, *Palms*, *Caladiums*, *Cypripediums*, *Oncidium*, and others. Groups of plants for effect, Orchids excluded, found Mr. Nicholsson to the fore with a very attractive arrangement of *Palms*, *Hydrangea paniculata*, *Crotons*, *Dracenas*, *Gloxinias*, and others. The arrangement was excellent. Second Mr. Clark, gardener to Sir T. F. Buxton, Warlies, with a good group, well arranged; third Mr. J. Watt, gardener to J. Reid, Esq., Enfield. With six miscellaneous plants, distinct, Mr. A. West, gardener to A. Lancaster, Esq., was first, having *Lantana borbonica*, *Pandanus Veitchii*, *Corypha australis*, and *Acalypha Macaefcana* as his best plants; second Mr. Ayling with a good *Allamanda*, *Pandanus*, &c.; equal third Messrs. Clark and Nicholsson. For six Ferns, distinct, Mr. Ayling was first, showing a grand plant of *Gleichenia Mendeli*; second Mr. Clark, who had a fine *Davallia Mooreana*; third Mr. A. West, whose best plant was *Phlebodium aureum*.

The class for stove or greenhouse plants brought out some grand specimens. Mr. Ayling was easily ahead, showing a plant of *Clerodendron Balfourianum*, a perfect mass of flower, and a huge *Lantana* of a variety called *Iris*; the specimen was covered with its orange scarlet flowers. Exhibitors should note this plant. Mr. J. Nicholsson had good plants of *Cycas revoluta* and *Stephanotis floribunda*. *Caladiums* found Mr. Nicholsson first with well-grown plants, Messrs. Hopkins and West taking the other prizes. Tuberous Begonias were a good feature. First, Mr. Ayling; second, Mr. Watt. *Achimenes* came out in the old style, in large pans, Messrs. Ayling and Nicholsson taking the prizes in the order named. Zonal *Pelargoniums* were not up to present requirements; Mr. Nicholsson was first, and Mr. Colville second. Specimen Orchids did not bring out anything very striking, Mr. Ayling showing a *Cattleya* and Mr. Nicholsson a *Cypripedium*. Specimen Ferns were very fine; Mr. A. ling was first with a very fine *Gleichenia*; second, Mr. Nicholsson with *Davallia Mooreana*; third, Mr. Colville, gardener to — Gibbs, Esq., Gilwell Park, with an enormous piece of *Adiantum formosum*. *Fuchsias* were well flowered, Messrs. Ayling and Nicholsson taking the prizes. *Coleuses* were not so good as usual, but Mr. Nicholsson's plants were well coloured. Messrs. West and Hopkins took the remaining prizes. Plants suitable for table decoration are always a strong feature here. Mr. Nicholsson secured the first prize with an even lot, followed by Messrs. Ayling and Clark.

Roses were well shown both as to quality and quantity. With six good entries in the twenty-fours the Judges found a little difficulty in fixing their awards. Mr. E. J. Robinson secured premier position, a notable feat for an amateur who has never staged a bloom before; Ulrich Brunner, Marie Baumann, and Jean Ducher were his best flowers. Messrs. Turk, gardener to P. Bosanquet, Esq., Berkhamstead, and Watt received the remaining prizes. In the twelves Mr. Robinson was easily ahead again; Mr. Langlands, gardener to M. Rose, Esq., Buckhurst Hill, being second, and Mr. Watt third. In the Tea class Mr. Langlands just got clear of Mr. Robinson, the former showing good *Perle des Jardins* and Jean Ducher; third, Mr. Turk. The Carnation classes were not so well filled, Messrs. Fear and Turk taking the chief prizes. Mr. Skinner was first for Pinks with massive flowers. Mr. Ayling was the victor in the class for cut flowers, stove or greenhouse, showing principally Orchids. In the hardy section Mr. Turk was a long way ahead, his staging being excellent; second, Mr. Clark; third, Mr. Hopkins.

Fruit was not abundant, but the general quality was good throughout. Vegetables were also good, and the baskets attracted a great deal of attention. A tent was set apart for ladies' decorations. For a single vase or epergne, Miss Vincent repeated her former successes by taking the first prize with a very elegant arrangement; second, Miss Ransley; third, Mrs. Gough. A group of vases found Miss Vincent again victorious, her arrangement being beautifully executed; second, Miss Litchfield with an arrangement of Iceland Poppies and Cornflowers; third, Miss M. Carr.

Numerous classes were provided for amateurs. Mr. Riggs (Roses), Mr. Fear (Carnations), Mr. Hitch (Pansies), and Mr. Gregory (hardy flowers), were the chief winners. Trade exhibits formed a very strong feature. Messrs. Paul & Son, Cheshunt, had some grand Roses and herbaceous flowers, Mr. Rumsey Roses and Palms, these two exhibits being much admired; Mr. J. B. Riding had *Violas* and *Pansies* and French *Gloxinias*, and Mr. T. Hamilton a group of Maidenhair Ferns. A large group of plants came from Mr. J. Riding, gardener to A. J. Edwards, Esq., Beech Hill.

The Exhibition was throughout extremely creditable, and reflects the greatest credit on Mr. J. Eve, the Hon. Sec., who carried out the whole arrangement to perfection.

ROSE SHOWS.

HEREFORD AND WEST OF ENGLAND.—JULY 12TH.

UNDER circumstances as different as possible from those which prevailed last year, when the National Rose Society held its provincial Exhibition at Hereford, and therefore in as unfavourable as could well be as far as one very important element is concerned—the weather—this old-established Society held its annual Exhibition, for a steady down-pour continued from the time the Show was opened until it closed. It is truly a disappointing thing when arrangements have been carefully made, when exhibitors have come from various parts, and when success or failure depends on one thing only, that that should be unfavourable. Last year the National was favoured with lovely weather, and as a consequence a great success was achieved. This year, without doubt, the Society will be sorely crippled. It will not be I am sure, as it has been with many a Rose society as well as horticultural society, that it will lead to a collapse; there are far too many lovers of the Rose in the country, and the Secretaries are too energetic to suffer such a catastrophe to follow one bad day.

Hereford has been long and favourably known for its Roses. The name of good John Cranston had made years ago the nurseries at King's Acre famous throughout the Rose world, while many of us can recollect the marvellous blooms which Mr. Jowitt used to bring up from the Old Weir to carry off trophies and cups and prizes from our principal shows. It was with the former that the idea of a National Rose Society first originated, and although it did not take shape until many years afterwards, yet it should never be forgotten that the idea was first broached at Hereford. Mr. Jowitt has long since ceased to be an exhibitor, but another amateur is keeping up the old fame of the county, although in a different line. Mr. Jowitt was essentially a grower of Hybrid Perpetuals, but the Rev. F. R. Burnside devotes himself to Teas and Noisettes, and at his prettily situated vicarage of Birch has been and is growing this beautiful class to perfection in soil admirably suited to them, and in general with favourable climatic conditions, although the last two seasons have been especially trying to him, for strange to say this part of England, which is generally moist and warm, has had two years of drought and cold. That the soil of Hereford is favourable to the Rose may be inferred from the wondrous profusion of the wild Rose which festoons all the hedges in the greatest profusion. I have in walking through the lanes seen *Rosa arvensis*, which I have never seen in Kent; it is a most beautiful Rose, reminding one of *Rosa macrantha*, having the same white petals with its yellow stamens.

But I have allowed myself to digress, and must now hark back to the Exhibition, which was certainly in many respects as far as the quality of the flowers was concerned a most admirable one. There was not a really bad box of Roses in the Show, while there were many of very great excellence both in the nurserymen's and amateurs' classes. In the former Mr. Frank Cant of Colchester, who has this year shown in such admirable form, swept the board; while in the amateur classes Mr. S. Budd of Bath took the leading place. Mr. Burnside and Mr. Fowler of Taunton were conspicuous for the position they took, and for the excellence of their blooms.

In the class for seventy-tvos Mr. Frank Cant of Colchester was easily first with a magnificent stand of blooms, some of them being of surpassing excellence, the bloom of Her Majesty being perhaps the finest ever exhibited, showing that when this most uncertain flower can be caught it is worthy of the name it bears. Louis Van Houtte was also a grand specimen. There were in the stand Marie Finger, A. K. Williams, Marguerite de St. Amand, Star of Waltham, Marie Van Houtte (beautiful), Souvenir de S. A. Prince, Dupuy Jamain, Ulrich Brunner, Hon. Edith Gifford, François Louvat, La France, Duke of Connaught, Madame Hoste, Horace Vernet, Comtesse de Nadaillac, Victor Hugo, Merveille de Lyon, Louis Van Houtte (fine), Mrs. Baker, Beauty of Waltham, Boieldieu, Lady Helen Stewart, Her Majesty, Sultan of Zanzibar, Marie Verdier, Charles Lefebvre, Madame Charles Crapelet, Madame Cusin, Mary Bennett, Jeannie Dickson, Ella Gordon, Rubens, Etienne Levet, Francisca Kruger, E. Y. Teas, Countess of Rosebery, Charles Darwin, Cleopatra, Duke of Edinburgh, Lady Mary Fitzwilliam, Xavier Olibo, Queen of Queens, John Bright, Jean Ducher, Gustave Piganeau, La Boule d'Or, Dr. Sewell, Mrs. John Laing, Duchesse de Morny, Madame Lambard, Fisher Holmes, Madame Hippolyte Jamain, Catherine Mermet, Alfred Colomb, Dr. Andry, Comtesse d'Oxford, Princess Beatrice, Ethel Brownlow, Heinrich Schultheis, Camille Bernardin, Pride of Reigate, Ernest Metz, Pride of Waltham, The Bride, Comtesse de Paris, Prince Arthur, Sir Rowland Hill (in good form), Pierre Notting, Marie Baumann, and Duke of Wellington. Curtis, Sanford & Co. were second, and Cranston & Co. third.

In the class for forty-eight single varieties Mr. Frank Cant was again first with Her Majesty, Gabriel Luizet, Merveille de Lyon, La France, Madame Lacharme, Souvenir d'Elise Vardon, Innocente Pirola, Marie Verdier, Comtesse de Nadaillac, Ulrich Brunner, The Bride, Marguerite de St. Amand, Caroline Kuster, Mrs. John Laing, Jeannie Dickson, Catherine Mermet, Jean Ducher, Silver Queen, Souvenir d'un Ami, Prince Camille de Rohan, Star of Waltham, Sir Rowland Hill, A. K. Williams, Suzanne Marie Rodocanachi, Pride of Reigate, Etienne Levet, Louis Van Houtte, Duke of Teck, Sultan of Zanzibar, Duchesse

de Morny, François Louvat, Marie Baumann, Duchess of Bedford, Dr. Hogg, Earl Dufferin, Duke of Wellington, Rosieriste Jacobs, Duke of Edinburgh, Reynolds Hole, Ernest Metz, Heinrich Schultheis, Ethel Brownlow, Charles Darwin, Prince Arthur, and Dupuy Jamain. Messrs. Cranston were second, and Mr. Geo. Prince third. In the class for twenty-four trebles Mr. Frank Cant was again first with Her Majesty, Mrs. John Laing, A. K. Williams, Prince Camille de Rohan, Merveille de Lyon, La France, Duke of Connaught, Madame Charles Crapelet, Charles Darwin, Pride of Waltham, Duchesse de Morny, Suzanne Marie Rodocanachi, Marie Baumann, Duchess of Bedford, Heinrich Schultheis, Baroness Rothschild, Ulrich Brunner, Comtesse d'Oxford, The Bride, Maréchal Niel, Alfred Colomb, Dupuy Jamain, Sir Rowland Hill, and Ethel Brownlow. Messrs. Cranston were second, and Mr. Geo. Prince third.

In the class for twenty-four, confined to Herefordshire nurserymen, Mr. Charles Whiting of Hereford was first with A. K. Williams, Marie Verdier, Merveille de Lyon, La France, Magna Charta, Baroness Rothschild, Charles Lefebvre, Horace Vernet, Marie Cointet, Sénateur Vaisse, Sir Rowland Hill, Mrs. John Laing, Madame Charles Wood, Comtesse d'Oxford, Caroline d'Arden. In the class for twelve trebles, Herefordshire nurserymen, Mr. Charles Whiting was again first.

In the amateurs' division Mr. S. P. Budd was first in the class for thirty-six with a wonderfully fine stand of excellent blooms, consisting of A. K. Williams, Her Majesty, Alfred Colomb, Merveille de Lyon, Duchess of Bedford, Marquise de Castellane, Star of Waltham, Mrs. George Paul, Charles Lefebvre, La France, Earl of Dufferin, Ulrich Brunner, Duchesse de Morny, Marie Rady, Mrs. John Laing, Ferdinand de Lesseps, Captain Christy, Louis Van Houtte, Queen of Queens, Marie Baumann, Suzanne Marie Rodocanachi, Harrison Weir, Countess of Oxford, Xavier Olibo, Prince Arthur, Baroness Rothschild, Gustave Piganeau, Catherine Mermet, Eclair, Etienne Levet, Horace Vernet, Reynolds Hole, Marie Cointet, Lord Beaconsfield, Princess Beatrice. Mr. Walter Drew of Ledbury was second, and Mr. E. B. Lindsell of Hitchin third. In the class for twenty-four varieties Mr. W. H. Fowler of Taunton was first with a box consisting entirely of Teas, comprising Princess of Wales, Niphetos, Madame Hoste, Francisca Kruger, The Bride, Catherine Mermet, Innocente Pirola, Ernest Metz, Etoile de Lyon, Madame Cusin, Caroline Kuster, Souvenir d'Elise, Comtesse de Nadaillac, Sunset, Madame de Watteville, Marie Van Houtte, Souvenir de Paul Neyron, Rubens, Perle de Lyon, Madame Hippolyte Jamain, Madame Margottin, Souvenir d'un Ami, Souvenir de S. A. Prince, and Madame Lambard. Miss Bulmer, Broadland, Hereford, was second; and Mr. James Rankin, M.P., third.

In the class for twelve varieties, distinct, Mr. Conway Jones, of Gloucester, was first with Earl Dufferin, Maréchal Niel, Sénateur Vaisse, Mrs. John Laing, The Bride, Prince Camille de Rohan, Francisca Kruger, Louis Van Houtte, Duchess of Bedford, Madame Hoste, Charles Lefebvre, and Souvenir de S. A. Prince. The second prize was awarded to the Rev. C. H. Bulmer, of Credenhill; and Mr. J. Davis of Bodenham was third. In the class for twelve trebles Mr. S. P. Budd of Bath was first with Alfred Colomb, Her Majesty, Marie Suzanne Rodocanachi, Merveille de Lyon, A. K. Williams, Duchesse de Morny, Gustave Piganeau, Etienne Levet, Duchess of Bedford, Louis Van Houtte, Catherine Mermet, and Charles Lefebvre. Mr. E. B. Lindsell was second, and Mr. Walter Drew third. In class 10, eighteen single trusses for Herefordshire amateurs, Mr. Walter Drew was first with M. S. Rodocanachi, Charles Darwin, Duchesse de Vallombrosa, Dr. Andry, Merveille de Lyon, Marie Verdier, Comtesse d'Oxford, Marchioness of Dufferin, Horace Vernet, Her Majesty, Louis Van Houtte, Lady Mary Fitzwilliam, Innocente Pirola, Earl of Dufferin, The Bride, Duke of Edinburgh, Jeannie Dickson, and Comte Raimbaud. Mr. J. H. Arkwright, of Hampton Court, Leominster, was second, and Mr. W. J. Ecroyd of Credenhill Court was third. In the class for twelve varieties Mr. John Ough, Hereford, was first with Sénateur Vaisse, Lady Mary Fitzwilliam, Marquise de Castellane, Général Jacqueminot, a remarkably fine bloom; Pride of Waltham, Countess of Oxford, Captain Christy, Heinrich Schultheis, Exposition de Brie, Merveille de Lyon, Horace Vernet, and Earl of Dufferin. The second prize was awarded to the Rev. Sir George Cornwall, Bart., of Moccas Court, and Mr. James Rankin, M.P., was third. In the class for six varieties, Mr. George Lewis was a creditable first with Ulrich Brunner, Baroness Rothschild, Marie Baumann, Merveille de Lyon, Sénateur Vaisse, and Captain Christy. Mr. J. Davis of Bodenham was second. In the class for six trebles Mr. Walter Drew was first with Horace Vernet, Suzanne Marie Rodocanachi, Louis Van Houtte, Earl of Dufferin, The Bride, and Dupuy Jamain. Mr. T. B. Giles was second, and Mr. James Rankin was third.

In the Tea and Noisette section there was a good and extensive display of fine flowers, and a keen competition amongst the amateurs with whom in the western counties this beautiful tribe is in great favour. In the nurserymen's class for eighteen Mr. Geo. Prince of Oxford was first with Ernest Metz, Innocente Pirola, Comtesse de Nadaillac, The Bride, Madame Cusin, Souvenir de S. A. Prince, Etoile de Lyon, Madame de Watteville, Souvenir d'Elise, Souvenir d'un Ami, Princess of Wales, Marie Van Houtte, Madame Bernard, Madame Hoste, Niphetos, and Jean Ducher. A very beautiful stand of flowers. Mr. Frank Cant was second.

In the class for twelve Teas Mr. C. Whiting of Hereford was first with Niphetos, Marie Van Houtte, Devonensis, The Bride, Souvenir de S. A. Prince, Madame Lambard, Anna Ollivier, Duchess of Edinburgh, Souvenir de Paul Neyron, and Madame Bernard, very good.

In the class for twelve Teas (trebles) Mr. Frank Cant was first with Souvenir d'Elise, Madame Cusin, Innocente Pirola, Catherine Mermet, Madame de Watteville, Ethel Brownlow, Ernest Metz, The Bride, Maréchal Niel, Edith Gifford, Marie Van Houtte, and Souvenir de S. A. Prince. Mr. Geo. Prince was second.

In the amateurs' class in this division the competition was strong, and very fine stands were shown. In the class for eighteen Teas the Rev. F. R. Burnside was first with a stand of clean and well developed flowers, consisting of Catherine Mermet, Madame Cusin, The Bride, Anna Ollivier, Innocente Pirola, Souvenir d'un Ami, Niphetos, Princess of Wales, Comtesse de Nadaillac, Ethel Brownlow, Jean Ducher, Cleopatra, Madame Bravy, Francisca Kruger, Rubens, Marie Van Houtte, Hon. Edith Gifford, and Madame Hoste. Mr. W. H. Fowler of Taunton was second, and Mr. S. P. Budd was third. Mr. A. Hill Gray was highly commended. In the class for twelve Teas Mr. Walter Drew was first with The Bride, Catherine Mermet, Hon. Edith Gifford, Madame Lambard, Niphetos, Comtesse de Nadaillac, Ethel Brownlow, Souvenir de Paul Neyron, Francisca Kruger, Madame Cusin, Souvenir d'un Ami, and Souvenir d'Elise. Mr. P. D. Giles was second, and Mr. James Rankin, M.P., third. In the class for six Teas, Mr. Conway Jones of Gloucester was first with Madame Hoste, The Bride, Maréchal Niel, Francisca Kruger, Innocente Pirola, and Ethel Brownlow. The second was awarded to Mr. T. A. Washbourne, Gloucester, and the third to Mrs. Cheale Cuthbert of Birch. For twelve Teas, trebles, Mr. A. Hill Gray of Bath was first with Princess of Wales, Souvenir d'Elise, Marie Van Houtte, Comtesse de Nadaillac, Hon. Edith Gifford, Maréchal Niel, Innocente Pirola, Francisca Kruger, Madame Cusin, The Bride, Catherine Mermet, and Alba Rosca. The Rev. F. R. Burnside was second, and Mr. S. P. Budd third. For six of one sort, Tea, the Rev. F. R. Burnside was first with Innocente Pirola. Mr. A. Hill Gray was second with Maréchal Niel, and Mr. W. H. Fowler was third with Francisca Kruger.

In the class for twelve light Roses one variety, the first prize was awarded to Messrs. Cranston & Co., for a very fine box of Her Majesty; the second to Mr. Budd for the same flower, and the third to Mr. George Prince for Merveille de Lyon. For twelve dark Roses, one variety, the first prize was awarded to Mr. Frank Cant for one of the finest stands of Marie Baumann I ever saw, clearly disproving what many have said, that this Rose is deteriorating. Messrs. Cranston & Co. came second with an excellent box of A. K. Williams, and Mr. Geo. Prince third with Marie Baumann.

For twelve yellow Roses the first was awarded to Mr. A. Hill Gray with Maréchal Niel, and the second to Mr. George Prince with Francisca Kruger. For twelve blooms of any Tea the first prize was awarded to Mr. George Prince with Souvenir de S. A. Prince, the second to Mr. A. Hill Gray with Maréchal Niel, and the third to Rev. F. R. Burnside with Innocente Pirola. For a box of six blooms of Comtesse de Nadaillac and The Bride alternately arranged, a very pretty arrangement, the first prize was awarded to Mr. Frank Cant, the second to Mr. A. Hill Gray, and the third to Mr. George Prince. For twelve bunches of garden Roses the first prize was awarded to Messrs. Cranston and Co., and the second to Mr. John Ough. The National Rose Society's silver medals were awarded for the best H.P. shown by an amateur to Mr. Walter Drew for Comte de Raimbaud, and for the best Tea to a remarkably fine bloom of Ethel Brownlow, shown by Mr. S. P. Budd, and for the best Rose shown by an Herefordshire amateur to Mr. Walter Drew for Louis Van Houtte.

There was a very nice selection of cut blooms of herbaceous plants, the first for twenty-four being awarded to Mr. Devonport of Foxley, the second to the Rev. Sir George Cornwall, and the third to Mr. Watkins. In the class for twelve Mr. James Rankin was first, the Rev. A. C. Lee second, and Mr. Heygate third. There were also some prettily arranged tables, in which, however, Roses were not used.

From this report it will be seen that a very excellent schedule had been framed, and the Show was well worthy of the repute of an Exhibition that has often been recorded by the facile pen of "A Herefordshire Incumbent." All the arrangements were well carried out, and with the one exception of the weather nothing could have been more successful.—D., Deal.

TUNBRIDGE WELLS.—JULY 13TH.

As might be expected there are many gentlemen's seats in the beautiful surroundings of this salubrious town, and good gardening in its various departments is conducted by capable men. Extensive and beautiful shows have been held in past years, but during the last three seasons the weather proved so unfavourable that a good attendance of visitors was out of the question, and the Society sustained loss in consequence. The Committee, like prudent men, protected themselves as much as possible this year by limiting the schedule, and it was well they did so, for showers were frequent, and would naturally deter many persons from entering the grounds. A very large hall was helpful, however, in which Roses and cut flowers were staged, and it is hoped the Show was as well patronised as it deserved, for if it was not so large as some of those of previous years it was excellent throughout. As Roses and cut flowers were the chief feature we place the report in this column, and append a brief reference to the other exhibits.

In the open class for forty-eight varieties, the Judges, Mr. Biron and his colleague, had no light task in finding the best three stands out of the eight evenly good collections staged, but they were equal to the task. The veteran, Mr. B. R. Cant, won the first position with not very large, but neat, well formed fresh blooms: Alfred Colomb, Alfred K. Williams, Annie Laxton, Augustine Guinnoisseau, Camille Bernardin, Charles

Lefebvre, Countess of Oxford, Dr. Andry, Duchess of Albany, Duke of Connaught, Duke of Edinburgh, Duke of Wellington, Dupuy Jamain, Earl of Dufferin, Edouard Hervé, E. Y. Teas, François Michelin, Gustave Piganeau, Heinrich Schultheis, Her Majesty, Horace Vernet, Jeannie Dickson, Lady Mary Fitzwilliam, La France, Lord Macaulay, Marchioness of Dufferin, Margaret Dickson, Marie Baumann, Marie Cointet, Maurice Bernardin, Merveille de Lyon, Mrs. Baker, Mrs. John Laing, Prince Arthur, Prince Camille de Rohan, Prosper Laugier, Queen of Queens, Reynolds Hole, Silver Queen, Star of Waltham, Ulrich Brunner, Xavier Olibo, Innocente Pirola, Madame de Watteville, Niphotos, Souvenir de S. A. Prince, Souvenir d'un Ami, and Maréchal Niel. Mr. Mount, Canterbury, was second, and Mr. G. Rumsey, Wrotham, third. In the open class for twelve Teas and Noisettes Mr. B. R. Cant again secured the premier position with good clean examples of Madame Cusin, Ernest Metz, The Bride, Souvenir de G. Drevet, Niphotos, Comtesse de Nadaillac, Souvenir de S. A. Prince, Maréchal Niel, Francisca Krüger, Marie Van Houtte, Souvenir d'un Ami, and Princess of Wales. Second, Mr. Piper, Uckfield. Third, Mr. Mount. Eight competitors.

In the amateurs' and gardeners' class seven stands of twenty-four blooms were staged, the prizes being awarded to T. B. Haywood, Esq. (Mr. C. J. Salter, gardener); Percy G. C. Burnand, Esq., Reigate; and M. Hodgson, Esq. (gardener, Mr. H. Shoesmith), Croydon, in the order named, all staging admirably. Mr. Haywood's varieties were La France, Duke of Teck, Alfred Colomb, Pride of Waltham, Comtesse d'Oxford, Duchess of Bedford, Her Majesty, François Michelin, Madame Eugénie Verdier, Louis Van Houtte, Etienne Levet, Merveille de Lyon, Earl of Pembroke, Captain Christy, Earl of Dufferin, Dupuy Jamain, Sir Rowland Hill, Mrs. Laxton, Mrs. J. Laing, E. Y. Teas, Xavier Olibo, Gustave Piganeau, and A. K. Williams. There was good competition in the smaller classes, but chiefly of local interest.

Herbaceous flowers and table decorations contributed to the beauty of the great Hall. In the class for twenty-four varieties of the former Mr. John Charlton, nurseryman, easily secured the first position with splendid bunches of choice varieties that would have taken some beating at any show in the kingdom. Mr. L. Dupond, gardener to C. B. Powell, Esq., Old Hall, Southborough, was a good second; Mr. H. Ware, gardener to Rev. J. Tillard, Penshurst, third. In the class for twelve varieties only one competitor was within the terms of the schedule, and was accordingly awarded the first prize. Prizes were adjudged for two other collections on their merits, but one contained a bunch of three varieties of Gloxinias, making fourteen varieties in his stand instead of twelve, and another exceeded the stipulated number in a similar way with other flowers. Mr. Portwall, gardener to Sir C. Lamb, Bart., Beaufort, Battle, had the first prize for a good stand of eighteen varieties. Mr. Charlton also staged an extensive miscellaneous collection, and the display was an imposing one. Table decorations are always good at Tunbridge Wells; Miss Harmer, St. Leonards; Mr. Searing, and Mrs. Hutton, Sevenoaks, were the most successful exhibitors.

Fruit was staged in the Hall. For a collection of twelve dishes Mr. C. Earl, gardener to Sir Julian Goldsmid, Bart., Tonbridge, was first with neat Pines (good), Black Hamburg Grapes, Cherries, Peaches, Nectarines, and Strawberries as his best dishes. Second, Mr. G. Fennell, gardener to W. M. Cazalet, Esq., Tonbridge, a Pine, Peaches, Melons, and Strawberries being of high merit. There was excellent competition in the Grape classes, the first prize for three bunches of black varieties going to Mr. J. C. Moorhouse, gardener to J. W. Temple, Esq., Leyswood, Groombridge, for Gros Maroc, very fine indeed. Mr. W. Avis, gardener to the Hon. P. B. Petre, Faircrough, Ladhurst, was second with excellent Madresfield Court, but not quite ripe; and Mr. Morris, gardener to C. J. Ebdon, Esq., Baldstow Place, St. Leonards, third with well-finished Black Hamburgs. With three fine bunches of Buckland Sweetwater Mr. James Wilkins, gardener to F. V. Williams, Esq., Shirley Hall, secured the first prize in the class for white Grapes. Mr. J. Friend, gardener to The Hon. P. C. Glyn, Rooksnest, Godstone, second with splendid bunches of Foster's Seedling. Mr. W. Harvey, gardener to W. Tennant, Esq., Whyteleaf House, Warlingham, third with Muscats. Mr. Moorhouse was first in the class for a dish of Peaches, with unusually fine fruits of Dymond. Mr. G. Bunyard, Maidstone, exhibited various kinds of fruit trees in pots, bearing excellent crops; a most creditable exhibit.

Stove and greenhouse plants were well exhibited in the marquees by Messrs. Portwall, Pope, and Howe; Caladiums by Mr. Dupond, Achimenes by Messrs. Wilkin and Ware, and Begonias by Messrs. Hollamby and Snow (gardener to C. de Murietta, Esq., Wadhurst). Mr. L. Dupond had by far the best group of plants, boldly irregular, free, and picturesque, for which the silver medal was awarded.

Mr. H. Scannell, gardener to C. J. Reilly, Esq., exhibited splendid fruits of Sutton's Matchless Cucumbers (very highly commended), and the best Melon was Sutton's Improved Green Flesh, exhibited by Mr. Searing. Tomatoes were wonderfully fine, Messrs. Johnstone, Hollamby, Harvey, and Pennell securing the prizes. Vegetables were excellent throughout the classes.

BEDFORD.—JULY 13TH.

THE ninth annual Exhibition was held under somewhat adverse circumstances, the morning opening drizzly and dull, followed after noon by downpouring rain, which continued throughout the remainder of the day. The open classes for Roses were well filled, and the blooms, owing, perhaps, to the previous dull weather, were remarkably fine and in

bright colour. No less than eight collections were staged in the open class for forty-eight distinct blooms, Mr. Frank Cant, Colchester, leading with beautiful and even flowers as follows:—Back row: Pride of Waltham (very fine); Comte de Raimbaud, Duchesse de Morny, an excellent Rose; Reynolds Hole, Horace Vernet, Harrison Weir, Denmark, Chas. Lefebvre, Mdme. Cusin, Marie Baumann, Her Majesty, Duke of Edinburgh, La France, Marquis of Dufferin, Mdle. E. Verdier, and Prince Camille de Rohan. Centre row: Mdle. V. Verdier, The Bride, Comtesse d'Oxford, Dr. Andry, Camille Bernardin and Mdme. S. Rodocanachi, both fine; Ulrich Brunner, Merveille de Lyon, Alfred Colomb, Pride of Reigate, a striking bloom; Glory of Waltham, Mdme. de Watteville, Marie Rady, Comtesse de Nadaillac, E. Y. Teas, and Ethel Brownlow. Front row: Dr. Sewell, Prince Arthur, May Bennett, Pierre Notting, Catherine Mermet, Duke of Connaught, Edith Gifford, Duke of Wellington, Mdme. Hoste, Annie Wood, Souvenir d'Elise, Duke of Teck, Mrs. John Laing, François Louvat, Ernest Metz, and Duchess of Bedford. Mr. B. R. Cant, Colchester, ran a close second, having some remarkable blooms, but his stand not quite so regular, Gustave Piganeau, Pride of Waltham, Camille Bernardin, Paul Neyron, Mrs. J. Laing, Mrs. Baker, Her Majesty, Maréchal Niel, and Mdme. S. Rodocanachi being notable flowers. Messrs. Paul & Son, Cheshunt, were placed third with a regular stand of smaller blooms; and Messrs. D. Prior & Son, Colchester, fourth. Messrs. Burrell, Mattock, Burch, and Frettingham also staged excellent flowers in this class, and if a medal had been offered it would have been well merited by a beautifully tinted bloom of Marie Van Houtte in the stand of Messrs. Burch.

For the open class of eighteen Teas and Noisettes—a well contested class—Mr. J. Mattock of Headington, Oxford, was first with delightfully clean and fresh blooms of Princess of Wales, Souvenir de S. A. Prince, Comtesse de Nadaillac, Souvenir d'un Ami, Madame Cusin, Innocente Pirola, Francisca Krüger, Souvenir d'Elise, The Bride, Ethel Brownlow, Edith Gifford, Catherine Mermet, Ernest Metz, Cornelia Koch, Comtesse Riza du Parc, Madame Welche, Madame Lambard, and Marie Van Houtte. Mr. Frank Cant was second, his best flowers being Souvenir de Thérèse Levet, Madame Cusin, Jean Ducher, and Jules Finger, Mr. B. R. Cant coming in third. All the stands, however, were excellent.

In the class for twenty-four distinct Roses, open to all amateurs, Mr. E. B. Lindsell, Bearton, Hitchin, was awarded first for a splendid box of blooms in his usual good form, staged as follows:—Back row: Charles Lefebvre, La France, Horace Vernet, Earl Dufferin, Gustave Piganeau, Her Majesty, Alfred Colomb, and Mrs. J. Laing. Centre row: Innocente Pirola, A. K. Williams, Comtesse de Nadaillac, Dupuy Jamain, Baroness Rothschild, Madame V. Verdier, La France, Duke of Edinburgh. Front row: Duchess of Bedford, Reynolds Hole, Marie Baumann, Prince Arthur, Marie Verdier, Charles Darwin, Duke of Wellington, and Merveille de Lyon. The Rev. W. H. Jackson, Stagsden Vicarage, Bedford, approached the champion very closely, and was placed second, having beautiful flowers of Her Majesty, Star of Waltham, A. K. Williams, Suzanne Marie Rodocanachi, and Innocente Pirola. Mr. W. Boyes, Derby, was a meritorious third, showing Madame S. Rodocanachi, Etienne Levet, Souvenir de S. A. Prince, Cleopatra, and Reynolds Hole in fine form.

In the amateurs' open class for twelve Teas and Noisettes Mr. Jackson exhibited a very fresh and beautiful lot, leading Mr. Lindsell, the champion, here, who, however, had an excellent stand, and came second, Mr. Boyes being third. In the open class for twelve cut blooms, all amateurs, Miss E. D. B. Denton, Stevenage, was first; Mr. G. Moules, Hitchin, second; and the Rev. F. Gall, Hitchin, third; and in the local amateur classes the Rev. W. H. Jackson was first for twenty-four blooms, including in his stand a truly majestic flower of Her Majesty, eclipsing all others in the Show for size. For twelve blooms Mr. Kingston, Bedford, led; and for twelve Teas the Rev. W. H. Jackson.

A grand display of hardy herbaceous and bulbous flowers formed a prominent part of the Exhibition, and for thirty-six bunches in the open class Messrs. Burrell & Co., Cambridge, took honours with large and tastefully arranged bunches of most of the showy and several new and striking varieties—*Salvia sclarea*, *Achillea Ptarmica grandiflora alba*, *Helenium hybridum*, *Iris M. Blouet*, &c. Messrs. Laxton Bros., Bedford, were a good second; Messrs. Paul & Son being third. The exhibition of plants was not extensive, but fine specimens came from Mrs. Wingfield, Ampthill House (gardener, Mr. W. J. Empson), to whom was awarded the first prize for a group, and for foliage plants, Mr. G. Robinson, gardener to Fredk. Howard, Esq., Bedford, leading also in some of the classes.

NATIONAL ROSE SOCIETY—PROVINCIAL SHOW AT CHESTER.—JULY 16TH.

VIGOUR, freedom, and compactness are a trio of laudatory adjectives so often applied to plants as to have become familiar in gardening circles. All of them could have been used in reference to the rain which fell in and around the ancient city of Chester on Saturday, July 16th. It was no ordinary, commonplace downfall, coming in fits and starts, as though with no settled object in view, but a rain of which the concentrated intensity seemed uncomfortably business-like, and filled one from the first with an uneasy conviction that it had come to stay. It did. It was there in the early morning; it was there when after breakfast a visit was paid to the great nurseries of Messrs. Dickson & Co., Limited; it was there when the Show was opened; and it was there when a late afternoon train conveyed a party of damp rosarians from Chester to the south. Many who read these lines are or have been connected in some way or other with flower shows, and they will not need to be told the

full significance of the conditions indicated, especially when it is added that the display was under canvas. A warning of what was to come was received the night before when perambulating the city walls, under the guidance of a human relic, who gave free play to a copious imagination when precise knowledge failed him. Objects were pointed out that could only be seen clearly "when it was going to rain," and the boldness with which they stood out gave dismal forebodings of the morrow. An endeavour was made to extract comfort from his general mendacity, but, such is the irony of fate, in this particular at least he had spoken truly. Strangely suggestive, too, was the title of the *venne*. The Show was announced to be held in the Folly Field, Flooker's brook. A folly it proved indeed, and whoever Mr. Flooker may be or have been, his brook appeared to have spread itself all over the scene of action.

Misfortunes, it is known, never come singly, and so it proved in this case. By some accident, oversight, or what not, the arrangement of the boxes turned out to be all wrong, and precious time was cut to waste in re-arranging the Show, consequently the judging did not commence till after twelve o'clock. Had the day been sunny and balmy this would have mattered less, but under the circumstances the delay was rather trying to the temper. Perhaps the latter accounts for the vehement endeavours of one gentleman to turn all unauthorised persons, ladies included, out into a soaking field in the pouring rain; but he was humanely overruled, and the Judges and reporters endured the discomfort. After all it was no great matter. Lovers of Roses do not allow their interest and enthusiasm to be easily damped when there is a good display of flowers before them. If they were such tender creatures as to be afraid of rain and occasional inconvenience such grand flowers would never be grown. And it is gratifying to be able to say that the display was good. We might safely go further, and say that it was a splendid one. This was the crowning consolation of what was in most respects a gloomy day. Not only were the flowers fine, they were abundantly so. It was not a case of a few exceptional blooms; there was a general high level of excellence all through. That some stands were distinctly better than others was to be expected, and, from the Judges' point of view, it was desirable; but it was not a case of one being very good and the others very bad; on the contrary, the seconds and thirds were good in almost every class. Take, for example, the Jubilee classes. In the nurserymen's the first, second, and third were all high-class stands, and in the unplaced division the quality was of uniform excellence. Mr. B. R. Cant's victory, of which recent developments had led anticipations to be formed, was not gained without a struggle, nevertheless it was decisive. In the amateurs' there were two very fine stands, those of Mr. Budd and the Rev. J. H. Pemberton, while Mr. Lindsell's was excellent too. In our report of the Crystal Palace and Reigate Shows we commented specially on the marked improvement of the Bath amateur, and his success was therefore not a surprise. Mr. Pemberton's defeat speaks volumes for the quality of Mr. Budd's blooms, for the Havering parson has proved conclusively in the past what a dangerous opponent he is late in the season. Mr. Lindsell is well known to be an "early man," and his overthrow at late shows is not unexpected, but it must in justice to him be stated that there was no stand in the section equal to his Earl's Court forty-eight. Like Mr. Frank Cant, he can well afford to rest on his early laurels.

In the largest trade class, that for seventy-two blooms, "B. R." again showed splendidly, and as he achieved a third victory with thirty-six trebles, it is evident that he is just now at his strongest. Messrs. Harkness have been hampered by the peculiar season, but had several good stands, and a special note should be made of Mr. H. Merryweather's improvement. The Southwell grower secured several first prizes, as well as the silver medal for the best H.P. The want of some clearly defined standard by which to judge was clearly shown in one or two of the Tea classes, that for twelve blooms (class 21) being perhaps the most notable case. In size and weight Messrs. Prior & Son were undoubtedly first, and the award went to them, but the blooms were sadly tarnished, some of the lower petals being very bad, whereas the second prize flowers were as clean and fresh as if they had been cut under glass, though not quite so heavy as the others. It is probable that a higher scale of points would improve matters in many cases, but in the present one the Judges were possibly unduly hurried owing to the lateness of the commencement.

THE JUBILEE CLASSES.

The Jubilee classes were instituted in 1887, and two challenge trophies value 50 guineas were provided—one for nurserymen, who were to exhibit thirty-six blooms, the other for amateurs, who were to exhibit twenty-four, the trophies being held for one year by the winners. These correspond with the challenge trophies at the Metropolitan Exhibition, and far more interest is naturally invested in them than in the largest of the ordinary classes. In the trade section Messrs. Harkness & Son scored a magnificent sequence of four consecutive victories until last season, when their unbeaten record was broken by Mr. Frank Cant. This year the latter carried all before him earlier in the season, and it was hardly to be expected that he would maintain his full strength until the close of the season. Mr. B. R. Cant, on the other hand, has been steadily creeping up, while the quality of Messrs. Harkness & Son's blooms was practically an unknown quantity owing to their enforced absence from many of the leading shows. They might come out strongly with a kind of meteoric burst, or they might be weak. Events showed that both the previous winners were doomed to defeat, as when the four boxes were uncovered Mr. B. R. Cant was seen to be clearly ahead, and the award of the Judges subsequently supported

general impressions. The veteran had a grand collection of flowers, certainly one of the best in the Show, or even of the season. His varieties were Her Majesty, Countess of Rosebery, Comte de Raimbaud, Chas. Lefebvre, Madame Cusin (very fine), Etienne Levet, Marie Baumann, Victor Hugo, Eugénie Verdier, Comte de Paris, Lady Mary Fitzwilliam, Madame Victor Verdier, Paul Neyron (superb), Dupuy Jamain, Lady Sheffield, Ulrich Brunner, La France, Duke of Edinburgh, Mrs. John Laing, Alfred Colomb (splendid), Duchesse de Morny, Madame Isaac Péreire, François Michelin (somewhat weak, an unfortunate blemish in an otherwise splendid stand), Prince Camille de Rohan, Suzanne Marie Rodocanachi, Gustave Piganeau, Jeannie Dickson, Earl of Dufferin (grand), Ernest Metz, Madame Crapelet, Marie Verdier, A. K. Williams, Pride of Waltham, Countess of Oxford, Star of Waltham, and Prince Arthur (magnificent). This stand was full of fine flowers, and exceptionally rich in colour. There was a lustrous glow about the blooms that betokened perfect condition. It is doubtful if a finer Prince Arthur has ever been shown than the last bloom in this stand. Mr. Frank Cant also had an admirable stand, but must have been several points behind. His flowers were very fine in colour and condition, but Baroness Rothschild and one or two others were rather weak. Perhaps the best flowers were Général Jacqueminot, Dupuy Jamain, Suzanne Marie Rodocanachi, Mrs. John Laing, and Gustave Piganeau. He was unmistakably second. Messrs. Harkness & Sons were third with a very good stand, somewhat lacking in weight. The flowers were very fresh and bright, Gustave Piganeau being an admirable example.

The amateurs' contest for the trophy has been almost as remarkable for the success of Mr. Pemberton as that of the nurserymen for the victories of Messrs. Harkness. It is true that in 1887 and 1888 that sterling grower, Mr. T. B. Hall of Rock Ferry, whom all would like to see in battle array once more, was the winner, but in the three succeeding seasons Mr. Pemberton was at the top of the tree. It seems almost a pity in one respect to spoil so fine a record as he was building up, but honour must be given where honour is due, and on the present occasion he was fairly, though by no means easily, defeated by Mr. Budd. If anyone deserved to taste the sweets of victory in the trophy class it was the latter. He is not only an excellent but a persevering grower. This season he has improved himself many points, and though hardly a match for Mr. Lindsell in the form the latter displayed at the Palace and Earl's Court, he has maintained the quality of his flowers admirably throughout the season. In the *Journal* report of the Metropolitan Exhibition it was suggested that with perseverance Mr. Budd might yet see his name in the honours list, but it was hardly thought that it would be so soon. On this occasion he had very heavy and richly coloured flowers, the varieties being Gustave Piganeau, Dr. Andry, Earl of Dufferin, Heinrich Schultheis, Louis Van Houtte, Madame Van Houtte (splendid), Marie Rady, Merveille de Lyon, Star of Waltham, Mrs. Paul, Chas. Lefebvre, Duke of Albany, Mrs. J. Laing, Ella Gordon, Alfred Colomb (very fine), Her Majesty, Duchess of Bedford, Harrison Weir, Marie Baumann, Marie Van Houtte, A. K. Williams, François Michelin, Etienne Levet, and Duke of Wellington. Mr. Pemberton's stand was a very fine one, but rather uneven. Her Majesty, Grandeur of Cheshunt, and Xavier Olibo were three of the best flowers, this trio being very fine. He was distinctly second. Mr. Lindsell was many points behind his form early in the season, but he has a record of which he may well be proud, and although only third on the present occasion, the magnificent flowers he staged a fortnight previously, will make the season a memorable one.

NURSERYMEN'S DIVISION.

To come to the ordinary classes in the schedule, good even quality throughout may be chronicled, although it was evident that the trade growers had concentrated their best blooms on the trophy competition. The principal class was for seventy-two blooms, and Mr. B. R. Cant, evidently in a winning vein, was again successful. His stand was composed of very bright fresh blooms, well coloured, but not very large. The best examples were undoubtedly Marie Van Houtte, Lady Helen Stewart, Victor Hugo, Ernest Metz, Mrs. John Laing, Marie Baumann (very fine), Duke of Edinburgh, Her Majesty, Gustave Piganeau, and Mrs. Paul. Mr. Frank Cant was second, very little in the rear, his blooms being large and rich, but one or two were rather past their best. Star of Waltham, Beauty of Waltham, Pride of Reigate, Souvenir de S. A. Prince, and Dr. Andry were conspicuous for their good quality. Messrs. Harkness & Son were third. This class was not so good as the seventy-two at the Palace, but with the Jubilee competition in view the growers could not be expected to show their best blooms in the big class.

In class 2, thirty-six varieties, distinct, three trusses of each, were asked for, and once more Mr. B. R. Cant was first. He is invariably strong with trebles, but his present stand, though a very good one, was not the best he has arranged this year. The great majority of the flowers were large and in good condition, but one or two were a little soiled. The varieties were Marie Baumann, Gustave Piganeau (very fine), La France, Duke of Edinburgh, A. K. Williams, Heinrich Schultheis, Baroness Rothschild, Général Jacqueminot, Dupuy Jamain, Madame Crapelet, Marie Finger, Prince Arthur, Alfred Colomb, Niphetos, Her Majesty, Prince Camille de Rohan, Earl of Dufferin, Marquise de Castellane, Duchesse de Vallombrosa, Charles Lefebvre (very good), Fisher Holmes, Pride of Waltham, Ernest Metz, Xavier Olibo, Ulrich Brunner, Lady Sheffield, Jeannie Dickson, Victor Hugo, Maurice Bernardin, Marie Verdier, Lady Helen Stewart, Sénateur Vaisse, Beauty of Waltham, Madame Cusin, Mrs. John Laing, and Madame Victor

Verdier. Mr. Frank Cant was a close second, his flowers being very fresh, and of good size; in fact, so far as general appearance went he was closer to his namesake in this than in either of the other classes, but pointing might have dispelled the impression. The well-known Irish growers, Messrs. Dickson of Newtownards, were third, so that if unable to score a win, they did not cross the water entirely in vain. Some splendid blooms were observable in the other two open classes for nurserymen. For example, in that for thirty-six distinct, single trusses, Mr. H. Merryweather won with a very beautiful stand, having weight, freshness, and fine colour. His Gloire de Margottin and Gustave Piganeau were wonderfully rich, other fine flowers being Dr. Andry (a splendid bloom), Ulrich Brunner, and Mrs. J. Laing. This was one of the best stands the Southwell grower has exhibited, and betokened considerable improvement. Messrs. D. Prior & Son were second with fresh but rather small flowers, and Messrs. Jefferies & Son third. In class 4, eighteen distinct, three trusses of each, Mr. Merryweather was again first, having beautiful blooms, all in perfect condition; indeed, the freshness and cleanliness of his flowers were noteworthy all through the Show. If he can get a little more weight he will some day be in the front rank. Gustave Piganeau, Mrs. J. Laing, Horace Vernet, Lady Mary Fitzwilliam, and Viscountess Folkestone were splendid. Messrs. Prior & Son were second with heavy richly coloured flowers, also forming a strong stand, and Messrs. G. & W. H. Burch were third.

AMATEURS' DIVISION.

Comment has already been made on the Jubilee trophy class, but that by no means exhausted the number of high class blooms in the amateurs' section. Here, as at the Crystal Palace, the new arrangement of classifying exhibitors according to the number of plants grown was tried, apparently with equal success, as there was abundance of competition. In 5 and 6, as in the Jubilee class, there was no restriction as to the number of plants grown, and the former ended in the success of another rising exhibitor, Mr. W. Drew of Ledbury. His defeat of Messrs. Pemberton and Lindsell, although they were not at their full strength, was a very creditable performance. Thirty-six distinct, single trusses, were asked for; Mr. Drew's stand was of medium excellence, the flowers being very even in merit, but one or two were rather faded. The Rev. J. H. Pemberton was second, and Mr. E. B. Lindsell third. The latter scored his first victory with twelve distinct, three trusses of each, Mrs. J. Laing, Ulrich Brunner, Alfred Colomb, and A. K. Williams being the best flowers in his excellent stand. Mr. Drew was second with a heavy lot of flowers, and Mr. Budd third.

Classes 7 and 8 were restricted to growers of less than 2000 plants. The first was for eighteen, distinct, single trusses, and Mr. Boyes, Bank House, Derby, was first, his flowers being rather small, but very neat and fresh. Mr. A. Whitton, Aiskew, Bedale, was second; and Mr. Jas. Parker, Old Headington, Oxford, third. Both had neat fresh flowers. In the second, twelve distinct, single trusses, were asked for, and with these the Rev. L. Garnett won, having heavy but somewhat coarse flowers; second, E. Mawley, Esq.; third, the Rev. F. Page Roberts. Class 9, twelve single trusses, was only open to growers of less than 1000 plants. The winner was T. Tatham, Esq., Wilmslow, who had a very fine stand, which did him the utmost credit. Second, Col. Standish Hore, St. Asaph. Third, Mr. John Ough, Hereford. Mr. Tatham displayed great promise, and may be expected to further improve. The next class, in which six blooms was the number specified, was restricted to growers of less than 500 plants. The first prize went to Mr. Richard Park, who had large richly coloured blooms. Second, Dr. Bell, New Brighton. Third, F. R. Fleming, Esq., Rowton, Chester.

Four classes were reserved for local growers, and these brought many good flowers. For twenty-four distinct, single trusses, the Rev. L. Garnett, Christleton Rectory, Chester, was first with a large, but not too fresh stand, in which Le Havre was very fine indeed. Mr. C. Burgess was second, and Mr. Stubbs, Nantwich, third. Colonel Standish Hore won with twelve single trusses. He had a medium stand, the flowers being fresh and well coloured, but somewhat lacking size. Second, Mr. J. Taylor, Hoole Hall Gardens, Chester; third, H. Roberts, Esq., Hope Mold. With six distinct, single trusses, T. R. Bulley, Esq., Liscard, was first; Mr. A. Baker, Crewe, second; and Mr. Fleming third. In the remaining local class, which was for six Teas or Noisettes, distinct, Colonel Standish Hore was first with a delightful stand, only marred by the soiled lower petals of Jean Ducher; second, Mr. Garnett; third, Mr. Stubbs. Several extra classes were provided for amateurs. In the first, which was for six new Roses, Mr. Pemberton was successful, staging T. W. Girdlestone, Jeannie Dickson, Mrs. Wilson, Gustave Piganeau, Augustine Guinoisseau, and Madame Caroline Testout. He also won with nine trusses of any H.P., being represented by Marie Baumann, fresh and splendidly coloured. Second, Mr. C. Burgess, Plumley, with Mrs. John Laing. Third, Mr. Budd with Marie Baumann. Mr. J. G. Churton was first with Merveille de Lyon in the class for six of any H.P.; Mr. Richard Park second with Mrs. John Laing; and Mr. Mallender, Hodsok Priory Gardens, Workop, third with Thos. Mills. With garden Roses the latter was first, and Mr. Pemberton second. These were good stands, but that of Mr. Pemberton was too crowded.

TEA AND NOISETTE DIVISION.

Teas and Noisettes were beautifully shown throughout. There were some of the best stands of them seen this season, the flowers being large, solid, and for the most part clean, although one or two otherwise splendid stands were marred by a few soiled blooms. The only open class was that in which twelve trebles were asked for. In this Mr. B. R. Cant

followed up his previous successes, but he could not have had a wide margin of points in his favour, for although his flowers were of good size they were not in the freshest condition. The varieties were Ernest Metz, The Bride, Ethel Brownlow, Niphotos, Francisca Kruger, Catherine Mermet, Souvenir d'un Ami, Souvenir de S. A. Prince, Comtesse de Nadaillac, Madame Cusin, Madame de Watteville, and Marie Van Houtte. Mr. Merryweather was second with smaller but much cleaner flowers, and Mr. Frank Cant third. Mr. G. Prince won with eighteen distinct, having a very fine stand, in which Souvenir de S. A. Prince, Madame Cusin, Catherine Mermet, and Innocente Pirola were very good. Mr. B. R. Cant was second, and Mr. Frank Cant third. With twelve distinct Messrs. D. Prior & Son were first with a good stand, in which Marie Van Houtte, Ethel Brownlow and The Bride were very fine, but all the blooms were not quite clean. Second, Mr. Merryweather with very fresh, clean, delicate flowers. Third, Mr. J. Mattock. Some judges would have placed Mr. Merryweather first.

The amateurs also showed Teas well. With twelve single trusses the Rev. F. R. Burnside was first, having Souvenir d'un Ami, Cleopatra, Innocente Pirola, Comtesse de Nadaillac, Marie Van Houtte, Catherine Mermet, Anna Ollivier, Souvenir d'Elise Vardon, Francisca Kruger, Princess of Wales, Madame Lambard, and The Bride in beautiful condition. Second, Mr. Budd, also with a splendid box; third, Mr. Hill Gray, with delightful flowers. The latter won with six trebles, staging Maréchal Niel, Souvenir d'Elise, Innocente Pirola, Madame Lambard, Comtesse de Nadaillac, and Marie Van Houtte, all charmingly fresh. Second, Mr. Burnside; third, Mr. Budd, both with admirable boxes. In class 24, nine distinct, single trusses, the competition was restricted to growers of less than 500 plants. Mr. J. Parker was first with large fresh flowers, Mr. Mawley second with beautiful blooms, and Mr. W. Boyes third. For six single trusses shown by growers of less than 200 plants, Colonel Standish Hore was first with a very good stand; Mr. R. G. Burgess, Knutsford, second; and Mr. Wood, gardener to J. Brown, Esq., Manchester, third. Mr. Hill Gray was first for nine single trusses of any Tea or Noisette, with Maréchal Niel, very good; second, Mr. Burnside, with Marie Van Houtte. For six of any Tea or Noisette, Mr. Boyes was first with Cleopatra; Mr. Parker second with Maréchal Niel; and Mr. Garnett third with Innocente Pirola.

OPEN DIVISION.

This was chiefly, though not wholly, devoted to individual varieties. For instance, the first class was for twelve new Roses, distinct, Mr. Merryweather was first with Gustave Piganeau, Marchioness of Dufferin, Salamander, Jeannie Dickson, Duc de Bragance, Margaret Dickson, Bruce Findlay, Danmark, Marie Mogat, Mrs. Watson, T. W. Girdlestone, and Mrs. Paul. Second, Messrs. Dickson, Newtownards; third, Messrs. Paul & Son. For twelve of any yellow, first, A. Hill Gray, Esq., with Maréchal Niel, rather small, but delightfully fresh; second, Mr. Frank Cant, with Comtesse de Nadaillac; third, Mr. Mattock, with Marie Van Houtte. For twelve single trusses of any light pink variety, first, Messrs. Dickson & Co., Newtownards, with a grand box of La France, fine both in size, form, and colour; second, Messrs. Harkness & Son with a beautiful box of Mrs. John Laing; third, Mr. Frank Cant, with the same variety, a little tarnished. There were nine other boxes. For twelve of any crimson, first, Mr. Merryweather, with an excellent stand of Gustave Piganeau, which he grows splendidly; second, Mr. W. Frettingham with Marie Baumann. Third, The English Fruit and Rose Co., with the same variety. Mr. B. R. Cant had the best box of a dark velvety crimson variety, staging Prince Arthur; Messrs. Prior & Son being second with Earl of Dufferin; and Mr. Prince third with the same variety. For twelve single trusses, six of any H.P. and six of any Tea, first, Messrs. Harkness & Son with Gustave Piganeau and Jean Ducher, both very fine; second, Messrs. Prior & Son with A. K. Williams and Catherine Mermet; third, Mr. Merryweather, with Suzanne Marie Rodocanachi and The Queen. Mr. E. Mount won with Polyantha Roses, Mr. Mallender being second. These were both moderate stands.

The class for three trusses of any new seedling Rose or distinct sport brought a variety named Mrs. W. J. Grant, from Messrs. Dickson and Co., Newtownards, which is, we believe, a cross between Lady Mary Fitzwilliam and La France. Be that as it may, it is a beautiful variety, and will probably take a leading position. The form is good, the petals broad and well folded, the colour rich rosy cerise. A gold medal was awarded. Two new Roses were also exhibited by Messrs. Harkness & Son. One, named Mrs. Harkness, an 1887 sport from Heinrich Schultheis, is extremely promising. It is soft rosy pink, somewhat in the way of Mrs. John Laing, a large, shapely, and well-built flower, bright and clear in colour. The other, named Merrie England, is also an 1887 sport from Heinrich Schultheis. It is very distinct, being a mixture of deep rose and white, almost exactly like a rose-flaked Carnation. It is a substantial, well-built, handsome bloom, and is likely to turn out a good garden Rose, being vigorous and very free. Mr. G. Swales, Beverley, had a new seedling, named Mrs. Arthur Wilson. It is a flower of great beauty, although the examples were small, having broad evenly folded petals. The colour is lustrous satiny pink—a beautiful shade. The Committee wished to see all these again.

The premier blooms were as follows:—Best nurserymen's H.P., a superb example of Gustave Piganeau from Mr. Merryweather. Best nurserymen's Tea, a large, heavy, well-built bloom of Souvenir d'Elise Vardon from Messrs. Paul & Son. Best amateurs' H.P., a fine Comte de Raimbaud, shown by Mr. Pemberton. Best amateurs' Tea, a beautiful Souvenir de S. A. Prince, from Mr. Mawley.

Mr. F. Garnett, Mr. T. R. Bulley, and the Rev. L. Garnett won

with herbaceous flowers, Mr. Page Roberts, Mr. Townsend Ince, and Mr. D. Large also showing well. In an annexe to the main tent was a large and beautiful display from Messrs. Dicksons, Limited, Chester. In the centre were some fine plants of *Dicksonia antarctica*, *Musa Cavendishii*, *Asparagus*, *Crotons*, *Scaevola elegans*, *Latania borbonica*, and other foliage plants. Below these were some banks of herbaceous flowers, such as *Gaillardias*, *Gladiolus bizantinus*, *Anne Boleyn* and other Pinks, *Liliums*, herbaceous *Phloxes*, *Pentstemons*, *Tritonia longiflora*, *Oenothera Youngi*, *Alstroemerias*, *Agrostemma Walkeri*, *Campanula Van Houttei*, *C. Burghalti*, *Anthemis tinctoria*, *A. t. pallida*, and many boxes of *Roses*, forming altogether a most effective group.

BIRMINGHAM.—JULY 19TH AND 20TH.

In the picturesque grounds of the Moseley College, a salubrious suburb of the metropolis of the Midlands, an excellent Rose Show was held on the dates named. Unfortunately rain fell in torrents on the opening day, and storms in various parts of the country resulted in many growers who had entered being unable to send blooms, the drawbacks amounting to 1600 *Roses*; still, the Show was extensive, and the stands were generally of high quality.

In the class for seventy-two varieties the "two Cants" had an extremely close contest, and it was only by a very close scrutiny that the relative merits of the collections could be determined. Mr. Frank Cant won the premier position by two or three points, though the second prize blooms of Mr. B. R. Cant were a trifle heavier.

In the class for forty-eight blooms seven collections were staged, the winning stand being that of Messrs. Perkins & Son, Coventry. Mr. B. R. Cant was second; Dicksons, Limited, Chester, third, and Messrs. Cooling & Sons, Bath, fourth, running each other very closely in order of merit. In the class for thirty-six trebles Mr. B. R. Cant stood alone and well won the first prize which was awarded. Six collections of thirty-six single blooms were placed in competition, Messrs. Perkins and Sons gaining the first position with superb blooms. Dicksons, Limited, were a close second, Messrs. Jefferies & Sons, Cirencester, third, Messrs. Prior & Sons, Colchester, fourth, and Mr. Frank Cant fifth in this fine class.

Four excellent stands of twenty-four Tea or Noisette blooms were staged, the prizes going in the following order:—Mr. Frank Cant first, Messrs. Jefferies & Son second, Messrs. D. Prior & Son third, and Mr. B. R. Cant fourth. For twelve blooms the prizes went to Mr. Frank Cant and Messrs. Prior & Son in the order named.

Five fine stands, three of Mrs. J. Laing and two of Merveille de Lyon, were in the class for twelve blooms of any light Rose. Messrs. Prior & Son were placed first with Mrs. J. Laing, Messrs. Perkins and Son second with Merveille de Lyon, and Messrs. Cooling & Son third with Mrs. J. Laing. In the corresponding dark class Messrs. Perkins and Son were first with A. K. Williams, Dickson's, Limited, second with Marie Baumann, and Mr. B. R. Cant a close third with Alfred Colomb. The blooms in both these classes were very good.

There was good competition in the local classes, also in groups of plants and bouquets, while several local exhibits contributed effectively to the general display.

The Mayoress and Mrs. Joseph Chamberlain judged the bouquets, &c., and Mr. Chamberlain spent a considerable time in the tent, scrutinising the *Roses* very minutely, and taking down names. The Show was ably conducted by Mr. William Dean.

WOLVERHAMPTON.

WE recorded the names of the prizewinners in the open classes last week, and now publish the names of the varieties with which Mr. B. R. Cant secured premier honours in the seventy-two class—one of the finest collections of *Roses* ever exhibited:—Alfred Colomb, Alfred K. Williams, Annie Laxton, Baroness Rothschild, Beauty of Waltham, Col. Felix Breton, Captain Christy, Charles Darwin, Charles Lefebvre, Countess of Oxford, Countess of Rosebery, Crown Prince, Duchess of Albany, Duchess of Bedford, Duchesse de Morny, Duke of Connaught, Duke of Edinburgh, Duke of Teck, Dupuy Jamain, Earl of Dufferin, Belair, Ella Gordon, Etienne Levett, Mons. E. Y. Teas, François Louvat, Général Jacqueminot, Germaine Caillot, Gustave Piganeau, Heinrich Schultheis, Her Majesty, Jean Souper, Jeannie Dickson, John Hopper, John Stuart Mill, Lady Helen Stewart, Lady Mary Fitzwilliam, Lady Sheffield, La France, Louis Van Houtte, Madame Clemence Joigneaux, Madame Ducher, Madame Isaac Pereire, Madame Victor Verdier, Marchioness of Dufferin, Margaret Dickson, Marie Baumann, Marie Cointet, Madame Bois, Marie Finger, Marie Rady, Marie Verdier, Merveille de Lyon, Mrs. Harry Turner, Mrs. John Laing, Paul Neyron, Pierre Notting, Pride of Waltham, Prince Arthur, Queen of Queens, Sénateur Vaisse, Sir Rowland Hill, Star of Waltham, Suzanne Marie Rodocanachi, Ulrich Brunner, Victor Hugo, Xavier Olibo, Madame Cusin, Marie Van Houtte, Niphotos, Souvenir de S. A. Prince, Souvenir d'un Ami, The Bride. The other portions of the Show are dealt with on another page.

TRADE CATALOGUES RECEIVED.

Messrs. E. D. Shuttleworth & Co., Ltd., Albert Nurseries, Peckham Rye, London, S.E.—*Foliage Plants and Coniferae*.
Messrs. E. H. Krelage & Son, Haarlem, Holland.—*Darwin Tulips*.

HARDY FRUIT GARDEN.

Pears.—Complete the summer pruning of Pears by removing the points of those shoots left at the previous prunings to strengthen and induce more vigorous growth on the lower portions of trained trees. From four to six leaves may be left in most cases, counting those that are large, deep green, perfectly clean, and uninjured, those at the base of the shoots being mostly imperfect, and not at all adapted for elaborating the sap and organising fruit buds, which is the object sought at the present time by the cultivator. The upper part of trees treated in a similar manner during previous weeks will now illustrate the wisdom of shortening the summer growths. The buds at the axils of each leaf will be assuming a plumper form, indicating a tendency to form fruit buds. Probably a few of the upper buds on some shoots will be breaking into wood growths, or a few, perhaps too early stopped or too closely pruned, may be developing several wood buds, which will ultimately shade and crowd the neighbouring spurs. If such shoots can be dispensed with remove them entirely. Those developing one, or at the most two, wood buds finally extending into growths may be allowed to grow until they have developed one good leaf, at which they should be pinched. Fruiting spurs where they are at all too thick will derive much benefit from having the weakest removed, also injured and imperfect leaves, as well as any so numerous that they unduly shade the fruit buds. This examination of the trees may reveal the haunts of a small greenish white caterpillar, which forms a web on the under side of the leaves, rolling and doubling a pair together to protect its chrysalis. If present these must be crushed; removing and burning the leaves attacked if badly perforated.

Where heavy crops of fruit are swelling some thinning will be necessary to relieve the trees and induce the production of finer examples. Liquid manure will also greatly assist the trees if heavily burdened with fruit, but it is wasteful to give it to very dry soil. Rather soak the ground first with clear water, then apply liquid manure, the virtues of which will be retained in the moistened ground. If a very hot period follows it is imperative to conserve the moisture by a mulching of strawy manure, or failing that a light sprinkling of dry soil over the roots will answer as well.

Plums.—Continue nailing or tying leading growths of wall trees their full length. Remove superfluous or misplaced growths entirely; those better placed which cannot be tied in without crowding the tree shorten to a few good leaves to encourage the formation of spurs, which will eventually fruit as well as extension shoots or those laid in place of older useless wood. Allow the swelling fruits as much light as possible by fastening aside any impeding growths. Other details of culture consist in keeping the foliage clean by removing insects with frequent syringings of water, clipping off injured leaves and disbudding at an early stage any gross shoots springing from the main stems. A final thinning of the fruit if necessary should take place, and assistance given to the swelling of the crop left by adequate moisture at the roots, giving liquid manure or not as the growth is strong or weak, the crop heavy or light.

Cherries.—Dessert Cherries treat in a similar manner, taking especial care to rid the growing points of leading shoots from clustering colonies of black aphides, which are so troublesome to the Cherry. Morello Cherries are not so liable to insect attacks, the growth of the current year's shoots being more rapid. Fastening in the reserved shoots and thinning out the surplus growths closely to the points from which they spring constitute the main work at present needing attention.

Peaches, Nectarines, and Apricots.—The same strict attention to fastening the leading shoots, exposing the fruit to the influence of light and sun, and assisting the roots of the trees with waterings and mulchings applies to these fruits. Strong young shoots that have produced laterals may have the latter reduced to the first joint for forming fruiting spurs rather than train them in for filling up space which can be occupied by earlier formed wood.

Outdoor Figs.—Young shoots for bearing fruit next season must be trained thinly so that each is exposed to the influences best tending to produce short-jointed well-ripened wood. All other shoots ought to be rubbed off as soon as it is found they will not be wanted, together with any gross sappy growths that issue from the old wood. The fruiting branches may be pinched at the fourth leaf which has fully developed on the terminal growths above the fruit. To allow these to extend serves to rob the fruit too much, but the few leaves left by the pinching assists the attraction of the sap to the fruit, inducing steady swelling and maturation.

Bush and Standard Fruit Trees.—At this period of the year trees are apt to become overcrowded with much useless wood, or rather wood which will be useless, and render neighbouring shoots useless, too, by overcrowding each other. The centres of standard Apples and Pears are often thickets of gross spray which ought to be promptly

subdued as soon as seen, and not allowed to obstruct light and air passing through the trees. The chief pruning standard trees require is to keep the wood thinly disposed over the whole tree, inducing every shoot to grow outwards, and none whatever to travel into the centre, where they destroy their own fruit-bearing powers. It is quite rational to remove obstructing branches of this kind now and not wait until winter time. Dead wood can also be better seen now. No shortening of young shoots is necessary for standard trees. The thin disposal of their branches induces fruitfulness. Currants and Gooseberries should have the young growth freely thinned, gross shoots being early removed, as their vigour occasions them to be robbers. The removal of superfluous wood accelerates the swelling and ripening, as well as improves the quality of the fruit.

Outdoor Vines.—These trained against walls or trellises will require frequent attention. If bearing shoots have been stopped at two joints beyond the bunches of fruit the lateral shoots resulting must be pinched at the first leaf, or if space allows one or two joints further. Train new shoots at distances sufficiently wide to allow of the main leaves upon them having plenty of room to develop, and stop them when the extent of the space is reached. Keep the fruit close to the wall where it will be partly shaded from the sun by the large and ample foliage in front.

Apples.—Apples soon show the result of lack of vigour in the trees by arrested growth, which often causes the young leaves to become curled, losing their green hue and taking on a brightly coloured appearance. This is due to the attacks of red spider, which extract the juices from the tissues. They are only prevalent on the shoots of trees deficient in proper support and probably moisture in the soil. Trees exhibiting this undesirable appearance will be benefited by receiving special attention in the way of increased nutriment accorded to the roots. Clear water and liquid manure of any kind will do much to restore vigour, which if not visibly apparent this season will be next. The removal and burning of bad leaves will be beneficial also, as blighted leaves are of no use whatever. In spite, however, of drawbacks of this nature many varieties of Apples continue to bear fruit annually if the blossom escapes injury from frost. Lord Suffield is one of the surest bearers under varying circumstances of culture, and will carry a fair crop of fruit when receiving but little attention from year to year. Such treatment ought not to be continued, as under neglect the trees assume very unshapely habits from the twisting and blowing about of the shoots by the wind. Standard trees in exposed positions suffer the most. Regulate the growths now, support branches heavily laden with fruit, thin out the smallest fruits, and stop the breastwood if not already done on walls and espaliers, or other forms where the trees are restricted.

FRUIT FORCING.

Peaches and Nectarines.—*Early Forced Trees.*—Such varieties as Hale's Early, Stirling Castle, and Royal George Peaches, Lord Napier and Elruge Nectarines that were started in December, or Alexander and Early Louise, with Advance Nectarine in January to ripen their fruit without hard forcing, which is never advisable, in May or early June, will for some time have been cleared of fruit, and the wood on which the fruit was borne removed, if not extension shoots, also any superfluous growths. This will have been of the greatest benefit to the trees, provided the foliage has been kept clean and the roots duly supplied with food. Efforts in this direction must not be relaxed; keep the plants clear of insects if necessary by the use of an insecticide and supplied with water, or in the case of weakly trees liquid manure at the roots. A light mulching tends to keep the roots near the surface and slight growth in the laterals to make them active, and these prevent the premature ripening of the foliage. The buds will be sufficiently plumped and the wood sufficiently matured to allow the roof lights to be removed. This is a commendable practice, not the least of its advantages being the thorough moistening of the border by the autumn rains.

Trees Starting in February.—These have the fruit ripe, and some still ripening, the fruit being finer and later than usual, and it shows the advantages of being allowed plenty of time. As the fruit is cleared off the trees cut out the wood that has borne it, and thin the growths where so close that the foliage cannot have full exposure to light and air. Cleanse the foliage of dust or insects by means of the syringe or engine, and if necessary use an insecticide. Keep the borders thoroughly moist, top-dress with an approved fertiliser, and wash it in. This enables the trees to plump the buds and benefits the foliage. Stop all laterals to one joint, or allow a little lateral extension if the trees have the buds in an advanced state, preventing premature ripening of the foliage by continuing the root action, with at the same time growth on which to expend it without danger of forcing the principal buds into growth. When the buds are well formed and the trees are not over-luxuriant remove the roof lights, but where lifting or root-pruning is contemplated the lights should not be removed, as the operation is better performed with soil only moderately moist, and that can be regulated by keeping the lights on.

Trees Started in March.—The stoning is now satisfactorily completed and the fruit taking its last swelling. The leaves should be drawn aside and the fruit raised by means of laths across the trellis, so that the apex will be to the light. Water the border both inside and outside with liquid manure, and keep it mulched with about an inch thickness of short lumpy manure, or top-dress with superphosphate two parts and one part sulphate of potash, mixed, at the rate of 4 ozs. per

square yard, and lightly point in. Avoid a close soapy mulch, as that does harm by excluding air. Ventilate early, leaving a "crack" on constantly, syringe by 7 A.M., and ventilate freely through the day. When the sun loses power in the afternoon begin to reduce the ventilation, and raise the temperature to 85° or 90° about 4 P.M., with a good syringing and damping of surfaces, but it must be done with judgment, for when the water hangs for any length of time on the fruit during the last stages of swelling it is liable to damage the skin, causing it to crack, or it encourages mould and may give the fruit a musty flavour. Always syringe so as to have the foliage and fruit fairly dry before nightfall, and when the day is likely to be dull omit the morning syringing. When the fruit commences to ripen cease syringing the trees, but afford air moisture by damping available surfaces, especially the border, whenever it becomes dry, ventilating rather freely, always leaving enough air on to ensure a circulation. The trees must not lack water at the roots or the fruit may ripen prematurely.

Late Houses.—The fruit is so backward that there will not be any need to retard it by having recourse to abundant night ventilation. If wanted to accelerate the ripening ventilate freely in the early part of the day and up to 1 P.M., then keep the heat obtained by reducing the ventilation so as to secure 80° to 85°, and at 4 P.M. close, syringing well, and no harm will come if the temperature rise to 90°, ventilating a little at 6 P.M., so as to let the pent-up moisture escape and the temperature gradually cool down. Attend to tying down the shoots as they advance, allow no more than are required for next year's bearing and the furnishing of the trees, and give all sufficient space for the full exposure of the foliage to light and air. Stop the laterals to one leaf and retain growth to attract the sap to the fruit. Any gross shoots which push laterals from the leaf buds should be cut back to where the buds are intact, or if likely to interfere with the equalisation of the sap cut them out altogether. These gross growths promote gumming, bad setting, and casting of the fruit in stoning. Expose the fruit to the light by drawing the leaves aside, and raise it from the under side of the trellis, as light and air are essential to its colour and quality.

Unheated Houses.—The trees have the fruit stoning, and, where there are early varieties, in the last stages of swelling. These, such as Alexander, Waterloo, Early Louise, and Early Rivers, will need to have water kept from the fruit; but the midseason and late varieties require syringing about 7 A.M., the house having a little ventilation constantly, increasing it with the advancing temperature, contriving to have it full at 75°, closing for the day at that heat. If it is wanted to accelerate the fruit keep through the day at 80° to 85°, but always with ventilation, and close sufficiently early to maintain that temperature, but not to raise it above 90°. Syringe again about 5 P.M. on fine days, but damp only when dull. Timely thinning increases the size of the fruits retained, therefore complete it as soon as the stoning is completed. Supply water or liquid manure to the borders as required.

Figs.—*Trees in Pots for Early Forcing.*—Keep down insects by syringing once a day, in hot weather twice; afford liquid manure at the roots, and pinch to induce a neat habit. Stopping must be regulated by the vigour of the plants and the varieties. Vigorous growers require more stopping than those of moderate growth, but the stopping should not be practised much after this time on trees which are intended for very early forcing.

Second Crops on Planted-out Trees.—Trees started about the new year have the second crop in an advanced state. Thin it, if not already done, reserving that at the base of the shoots, which, as a rule, finishes better than that at the points, which must not be allowed to bear, as it is on this part that the first crop in the next year is produced. Nor must the second crop tax the energies of the trees too severely if they are expected to afford a full crop of early fruit next season. Attend regularly to tying the shoots, training them thinly, and allow plenty of space in the ties for the shoots to swell. Stop side growths at the fifth leaf, but do not retain these spur growths to the extent of crowding. Afford water or liquid manure in accordance with the extent of the rooting area. Trees in narrow borders may need it every day, those of larger area corresponding thereto. Overwatering can hardly occur in hot weather, provided the border is formed of sound materials, the roots active, and the drainage thorough. Feed with liquid manure or mulch with short manure, keeping it moist, but not always saturated. Syringe twice a day forcibly to dislodge red spider, but with proper feeding and attention there will be little need for insecticides. Dislodge scale with a brush and a soapy solution. Admit a little air constantly, increase it early, close early with plenty of moisture, and the fruit will swell to a good size. When it is ripening a circulation of air constantly will insure perfection.

THE BEE-KEEPER.

APIARIAN NOTES.

STILL FEEDING BEES.

BEE-KEEPERS in this locality are still feeding most of the stocks to keep them alive. Bees lie strewn about everywhere in a dead or dying state, and hives become less instead of increasing. It is

with difficulty that manipulations can be carried on, and not a May nor June-bred queen is laying yet. This is the worst bee season up to date ever experienced. However, we hope to have a week or two of summer and honey weather before the close of the season.

PUNICS.

I am sorry all my plans to fully test the Punics have as yet been frustrated. Up till May the Punics seemed to take the lead; after that the pure ones appeared to suffer more from loss of bees than the others. The crosses, however, kept their ground, and were ready to swarm two weeks earlier; but, being delayed through stress of weather, swarmed first, yet on the same day as the Carniolans. On account of the young queens being hatched in the former the first swarm was less in size, so that even after careful weighing it would not have been a sure test had there been honey. Contrary to previous experience, the old queen was kept safe by the swarm. The young ones that accompanied it taking refuge in nuclei and other hives gave me no little trouble. Thanks to noisiness of the Punics, their usurpations, like that of the pirates of others' inventions and ideas, betrayed their places of refuge; they were duly searched for, and as quickly dispatched. Had it not been for their loud trumpeting my nuclei of pure breeds would have all been changed into second cross Punics.

On further examination of some of my stocks on the 2nd, I must say that both pure and crossed Punics were, with the exception of the crossed Syrian, as rich in honey as any other breed, and everyone I gave queens to in 1891 reports Punics the best of any. A first swarm only half a mile distant has four 6 lb. supers well forward, the only ones known in the neighbourhood. From an Italian cross Mrs. Glen, Barrhead, took a super of 19 lbs. at the end of June; but it is a better locality than ours.

So far as experiments have gone they have proved that what has been printed on Punic bees outside these columns is inaccurate and unreliable, even to that which says no honey need be expected from first swarms; but let truth prevail!

I have several inquiries for Punic queens. I wish to repeat that I do not sell them. It would not be fair of me to do so on the strength of another's advertisement in the *Journal of Horticulture*. I do not know what I may do in the future, but if I arrange to sell queens I shall advertise.

SWARMING AND SUPERING.

As a rule, in such weather as we are experiencing bees, if they have sufficient breeding space, make no preparation to swarm. If the bee-keeper is watchful of his bees and the weather he will know to a moment when to super, and if that is done at the right time the bees will at once take possession of the supers and fill them rapidly. If he takes further thought he will, by properly estimating the strength of his hives, be able to place two sets of supers upon some of the strongest, which will be filled more rapidly, and be of greater beauty than those on weaker hives. If any super stocks swarm remove the stock at once to a good distance, or within doors for a time, so as to secure as many bees to the swarm as possible, placing a decoy hive on the spot until the swarm takes its place, which should be without delay, then transfer the supers from the stock to the swarm.

Should the weather break shortly after the transfer of supers transfer all combs containing honey from the stock so that the swarm will finish the supers. Of course these combs must have their seals broken and placed in an under division of the swarm's hive. The great majority of practical hints are not to be found in books, nor is it possible to state them all here, as they must vary with the weather, which is variable in the extreme. Bee-keepers should therefore study well what is best to do for their bees and their own advantage.—A LANARKSHIRE BEE-KEEPER.

PUNICS—MORE DARKNESS.

No wonder you make no attempt to make matters clear to Mr. Carlton, on page 19, July 7th. The same Editors of the paper in question told a correspondent on September 17th last that they were acquainted with the bees of Tunis, but the so-called Punic bees did not exist in that country. Now, on June 30th they make it clear that I got them from Tunis. They also say they were one week at the "spot." On July 7th they say it was not during their swarming season, and a few lines after they speak of them throwing large numbers of swarms, sometimes with as many queens as worker bees, and they themselves counted sixty cells on one comb. How bees can construct so many cells, and swarm with more queens than bees, all in "one week," and yet not be their swarming season, is a puzzle to me, and will be so to every other bee-keeper who understands anything of their natural history. It may go down with novices who do not know how long it takes queens to develop, and there are some who will believe anything that some people tell them, like the old woman who said she had so much faith in her parson that if he said Jonah swallowed the whale she would believe him. It is almost astounding to read of an explorer making such wonderful discoveries in one short week. I have never seen so much during the "seven years" I have had Punics. The way the traveller contradicts himself, and differs from every person's experience who has tried these bees, leads to the conclusion that he has been misled. If Mr. Carlton will bear this in mind, he will not be surprised by the conflicting statements he desires to be made "clear."—A HALLAMSHIRE BEE-KEEPER.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Book on Vines (G. H.).—Mr. Taylor's book "Vines at Longleat," was published at this office, but has been out of print for some time. The author might have a spare copy which he could let you have.

Heating Forcing Houses (A. G.).—As your letter is not of urgent importance we will reserve it for fuller consideration and reply next week than could be given to it in the midst of busy preparations for press.

Moveable Fowl Houses (M. A. K. F.).—These are not made by the majority of the horticultural builders, but probably you could get them from Mr. Cooper, 751, Old Kent Road, London, S.E. We think he makes them.

Iris stylosa (M. F. C.).—In late districts and on cold soils this Iris cannot be depended upon to bloom in the open, and in these circumstances it is necessary to cover the plant with a bellglass or handlight in October, and to allow this to remain until spring, tilting the glass so as to admit a supply of air. See Names of Plants.

Aquilegia glandulosa (M. F. C.).—This fine Aquilegia is of somewhat difficult culture in some soils, but may be grown successfully in a moderately light loamy soil with a plentiful supply of water while coming into bloom. It is, however, a plant which frequently gives a good deal of trouble before its precise requirements can be found in any particular garden.

Grapes Cracking (N. W.).—We have no doubt the chief cause of your Madresfield Court and Ferdinand de Lesseps Grapes cracking is an excess of atmospheric moisture. These Grapes are prone to crack through the peculiar nature of the skins, through which moisture passes freely, rupture ensuing. The best Grape growers prevent the evil by preventing the cause of it. This is done by free yet judicious ventilation, and not allowing anything approaching "still" damp air to surround the berries. This is far more conducive to the evil than is moisture in the soil, though this when it can be prevented, as in inside borders, should not be excessive.

Wireworms in Vine Border (G. G.).—There is no better plan than the Carrot traps, which take them alive, and the cultivator has the satisfaction of knowing when he kills them that they cannot do further

mischief. The baits should be placed about 1 square foot apart, and, examined daily; the pests will soon be cleared. There is no wholesale method of destruction but poison, and that is not so good as the Carrot baits on so small an area as the Vine border. If after using the baits a few days no more wireworms are taken, you may sow Mustard on the border, and let it grow until it commences to flower, and then trample it down and cover with a little fresh soil.

Superphosphate of Lime (Kittie).—Instead of scattering the sediment we should prefer to strain the liquid by passing it from one vessel into another through a piece of muslin, or by pouring it out carefully. This could be used about twice a week to plants requiring support, giving it in the form of an ordinary watering. It would tend to improve the bushes, and would be safe. It is probable, however, that greater benefit would accrue from a light dressing, say a quarter of a pound to the square yard, applied to the bushes in spring, scattering it on the soil, and hoeing it in carefully, or pointing it in with a fork. Try both plans, and note the results.

Scab on Tomato (Keswick).—The best preventive is thorough exposure of the plants to light, a genial atmosphere, kept buoyant by gentle warmth and careful ventilation. The atmosphere has been too close, hence mould at the apex of the fruit where the flower had been. Beneath the dried skin there were filaments (mycelium) of a fungus which has not broken through because the scab is too hard and dry, and will not, we apprehend, appear, as the fruit is so far advanced in ripening. But the fungus appears to be *Cladosporium lycopersici* dormant, and may in this case appear in the fruit of the progeny under favouring conditions.

Training and Setting Melons (Anxious to Know).—You appear to have proceeded correctly in training the Melons. Fertilise one flower on each of the side shoots, endeavouring to do all at the same time in order that they may swell evenly. Do not allow more than one fruit on each shoot. Permit the growths to develop one healthy leaf beyond the fruit, and then stop them, or you will have the plants densely crowded with foliage. If the weather is bad for artificial setting the chances would be worse for impregnation to take place without, therefore transfer the pollen in the usual way from the staminate to the fruit-bearing bloom. Do not overcrop the plants. Probably four fruits are as many as each will develop properly.

Spots on Ivy-leaved Pelargonium Foliage (E. G. B.).—The leaves are spotted by the inroads of a small micro-organism, which produces a yellow discoloration of the green parts, as you may see if you hold a leaf up to the light; and the scab is a result of the abnormal growth of the epidermal tissues, and the consequent effort to cover the injured part with a fresh skin (cuticle). The yellow spot is probably caused by a minute fungus, evidently a septoria, whilst the scald is due to another fungoid growth of the genus *Tubercinia*. Try spraying the plants with a weak solution of ammoniacal carbonate of copper, for which a formula has repeatedly been given in these columns. But there is nothing like a genial atmosphere and a free-rooting medium, not over-watered, nor too rich, for keeping the plants in health.

Aphides on Pansies (C. B.).—There is no difficulty in destroying green fly on Pansies if they can be reached by a solution of quassia and softsoap, but when the insects have been overlooked and allowed to increase till the leaves become curled up it is not easy to reach them. In such cases it is often advisable to take the tops off if much infested, and encourage fresh growth, which should be kept clean. Boil 2 ozs. of quassia chips gently for twenty minutes, also dissolve 2 ozs. of softsoap in a gallon of water, mix, and then add another gallon of water, then if you can dip the Pansy shoots in the mixture you will find it will destroy the insects. Tobacco powder will also destroy all you can dust with it. Mr. Simkins' work of 110 pages, entitled "the Pansy, and How to Grow and Show It," is good. It is published by Messrs. Cornish Brothers, Birmingham, and Simpkin, Marshall & Co., London. The price can be obtained from a bookseller.

Eucomis punctata (C. R.).—The plant of which you send flowers, taken from a spike, is an *Eucomis*, probably *E. punctata*. It is a Cape of Good Hope bulbous plant, and was introduced to this country in 1783. It is easily cultivated, growing well in sound loam kept porous with crushed charcoal and pressed down firmly. After flowering the plants may be stood in a sunny position in the open air, giving adequate support for producing good foliage. Allowing seeds to ripen has a weakening tendency. Reduce the supply of water as the foliage ripens, and keep the soil dry, but not dust dry, in winter in a frame or cool house from which frost is excluded. In spring abundance of light is needed by the growing plants, with adequate supplies of water for their support. We have had plants established in a narrow border in the open air for years next the south wall of a greenhouse. The bulbs are nearly a foot deep, and the border is mulched with manure on the approach of winter.

Bottling Green Gooseberries (J. M., York).—The Gooseberries should be of the small varieties, Rumbullion being the best, and not more than half grown. Put them into open-mouthed bottles, such as are used for pickles, and fill with soft cold water that has been boiled. Place the bottles up to the neck in cold water, and let it boil until the fruit begins to shrink, which will be in less than five minutes. Remove the vessel from the fire, or, if it be a copper, take the fire from under it, and when the water is cold take out the bottles. They should not be removed hot from the water, as sudden contact with the air might crack them. When cold cork securely, and wash over, as the corks of pickle

bottles are done, with resin. The bottles may then be buried in the ground, not less than a foot deep, in a dry cool place, on the north side of a wall, but it answers just as well to keep bottled Gooseberries in a dry cool place, such as is often available in cellars or dark store rooms. We are not aware that Cherries and Red and White Currants may be treated in a similar manner; indeed, these fruits are not generally used for tarts in a green state. It is no uncommon thing, however, to preserve ripe Morello Cherries in brandy. These are called brandy Cherries, and are used at dessert. The liqueur is termed Cherry brandy.

Insect on Pea Haulm (T. L.).—The growing points and flowering parts of the Pea haulm are destroyed by the larvæ of a moth belonging to the group of *Tineina*, and only differ from the Diamond-back or Turnip moth larvæ in being about eight times smaller. Dusting the haulm with dry soot or quicklime in the morning or late evening, when damp with dew, has been found effectual against the pests. Lime water made by slaking freshly burned limestone or chalk in a tub and adding 3 gallons of water to each pound of lime used, stirring well, and allowing to stand forty-eight hours, then syringing the Peas with the clear water only, has also been found efficacious. Preventive measures ought, however, to have been taken at a much earlier period. Quassia water is useful against the pest, and taken in time sufficient to prevent infestation. In extreme cases 1 oz. of Paris green to 20 gallons of water has been had recourse to and completely extirpates these pests, as well as those belonging to the group *Tortricina*, or Leaf-roller moths. It must, however, be used very carefully, and not over vegetables which are used for food. It must only be used as a spray, and kept well agitated whilst being applied. It is a dangerous poison. If you add 2 ozs. of softsoap to every gallon of the quassia water it would prove more effectual by holding on to the haulm better and longer.

Tomato Flowers not Setting Fruit (X. Y. Z.).—The flowers are imperfect, and the fruit cannot possibly set. In fact, the ovaries appear to be destroyed by some fungus, evidently that of the Potato, *Phytophthora infestans*. We should try "bouillie bordelaise," which may be made of 5 lbs. of sulphate of copper, 2½ lbs. of unslaked lime, and 25 gallons of water. Put the sulphate of copper in a bag, and suspend it in cold water overnight or until the sulphate is completely dissolved. The lime, freshly slaked with water and kept till it is cooled, should be poured into the bluestone solution through a sieve, so as to catch the stones and hard lumps. Keep the liquid continually stirred as the lime is being added. With this mixture spray the Tomato plants, keeping the mixture well mixed if a syringe with a spraying nozzle is used; but the Eclair knapsack pump is much the best means of applying bouillie bordelaise. All that is necessary is to coat the foliage and plants with the thinnest possible film, yet effectually in every part. It, however, must be kept from the fruit after it is more than a quarter advanced in swelling, and be well syringed in the course of a few days so as to cleanse it of the copper. As you cannot get the fruit to set the early preventive treatment is necessary. After the fruit becomes infected there is great danger in using the bouillie bordelaise, through its adhering to the fruit and being a possible source of danger, as the sulphate of copper is very poisonous.

Grapes Unsatisfactory (Y. Z.).—The Grapes are in a very unsatisfactory condition. They are small, badly coloured, and shanked, and the quality is inferior. We should have liked to see a specimen of the growth as well, for the bunch clearly indicates that there is something seriously wrong with the Vines. You say that they have been planted about twenty-seven years, that they are in a narrow inside border 16 inches wide, and that they are allowed to run outside. You add that the rods are 17 feet long, carrying twenty-five bunches, of an average weight of 1½ lb. First, we think it highly probable that the majority of the principal feeding roots are outside the house, and it is most likely that they have run into poor material, possibly sour and inert. This would tend to enfeeble growth, small bunches, small fruit, shanking, and imperfect colouring. Moreover, the evil has been aggravated by overcropping. Vines in the condition that we may reasonably suppose yours to be ought not to carry upwards of 2 lbs. per foot of rod, or even half that weight. With respect to ameliorative measures the first step should be the removal of all such bunches as that you have sent, even if this means stripping the Vines entirely of fruit, for they are worthless, and will only put a further strain on the already enfeebled rods. Then in the autumn, as soon as the leaves turn yellow, we should bare the roots and endeavour to trace their course. If, as we suspect, they have run into some bad soil, remove them, cutting off any that are decayed, and shortening others that are very rank in character. Lay them nearer the surface in fresh soil, such as sound turfy loam, with a sprinkling of wood ashes, over a foot depth of rubble for drainage, and you might also notch a few of them, and place a few handfuls of wood ashes around them in order to encourage the formation of fresh fibres. Press the soil firmly around them. With the formation of a network of roots of a fibrous character, such as may be expected to issue consequent on the employment of sweet, friable, fertile soil, more healthy and vigorous growth may be looked for. Maintain this in health by keeping insects under, and by full exposure to light, not permitting overcrowding. Crop the Vines lightly next season; half a pound of fruit to each foot of rod will be ample. With due attention to other details of management we think that improvement will result, provided the Vines have not been injured beyond recovery, in which case there will be no resource but to plant young ones in a fresh border. Your desire to effect improvement is praiseworthy, for such Grapes are not a credit to anyone.

The Nettle as Food (*E. F. Yorks*).—Young Nettle tops are closely gathered and readily eaten in some districts in the spring. As to their value, you may peruse what Mr. Josiah Oldfield, M.A., B.C.L. (Oxon) wrote some time ago in the *Pall Mall Gazette*:—"It is in springtime that man's heart is said to 'lightly turn to greens,' and this craving is a warning of Nature not to be despised. Sprouts and Cabbages bound the horizon of 'greens' in the eyes of the ordinary cook, so that this scant variety, combined with a minimum of originality in the mode of tasty cooking, causes the *crambe repetita* to be a stock subject for scornful sarcasm. May I press upon your readers—with the hope that by patient persistence year after year our descendants may possibly be influenced to use foods that are now despised—that there is a valuable vegetable that comes in early, when everything is scarce, and lasts in season till other things are abundant, which grows without care or trouble in every hedgerow and neglected corner, and loves the ditch banks beneath old fences? Beds of it spring up year after year, tender, luscious, and juicy, on waste lands and entangled glades, and grow rank and strong, and die down again in autumn, unknown and uncared for, while all the time the poor are hungry, and the rich are dyspeptic, unconscious of the value of this plant to help to fill the stomachs of the first and relieve the troubles of the latter. The vegetable to which I refer is the common Stinging Nettle (*Urtica dioica*). To gather it take out a basket, a pair of gauntlets, and a strong pair of scissors, and cut off the young shoots, which are just now ready in sheltered places and soon will be plentiful everywhere. Take them home, put them in a sieve, and pour water over them to cleanse them; then put them into boiling water, and boil sharply till done. They have now lost all power of stinging, and taste like very delicate Turnip-tops. They may be served on toast like Spinach, with fried or poached eggs. If people believed more in the *medicatrix vis naturæ*, and took their tonics, antiscorbutics, and diuretics direct from Nature's delightful laboratory as she supplies them in their due season, we should have less and less of the miserable wail of an increasingly dyspeptic humanity and more of the happy melody of joyous health."

Potato Disease Experiments (*F. Smithson*).—The Bordeaux mixture has been of service in some cases, while in others it has had no profitable result. Messrs. Robert Veitch & Son, Exeter, sent us a report of their experiments last autumn, from which we cite the following:—"In our nursery we selected a piece of ground that was almost level, and of an oblong-square shape, measuring 90 feet by 60 feet. The soil was a deepish loam, resting on a bed of red clay, and the aspect was perfectly open. The drills ran the short way of the piece—east to west—and were thus each 60 feet in length. We planted ten varieties. Two were new to us, being sorts lately raised in America; four were comparatively new sorts, of English origin; the other four were—The Dean, Village Blacksmith, Early Puritan, and Prodigious. Ordinary and not very rich animal manure was used, with a fair dose of lime put in at planting time. Eight feet of each drill was staked off at the top, and was treated on the Janssen principle; 8 feet at the bottom was treated with the Bordeaux mixture; and the 44 feet in the middle of the drills was not treated at all. By the 24th of July the disease had shown itself in a pronounced form, especially upon The Dean and the Village Blacksmith. To the 8 feet at the bottom of the piece we then applied the solution over the foliage, at the rate of 140 to 150 gallons per acre. A day or two after the application the rough-leaved sorts showed signs of having been 'burnt' in the foliage—the effect of the mixture—but the smooth-leaved sorts did not show any such effect. This seared appearance, however, soon passed off, and the plants apparently renewed their growing term and assumed a healthier hue than before. In due course, one after the other of the sorts began to show signs of maturity from the top of the piece to within 8 feet of the bottom, but, to a single plant, the instant the drill reached the copper-treated Potatoes, decay was arrested, and the haulm remained green and flourishing. We were astonished at this new phase, for, though several agriculturists in France, as we have since learned, had in 1890 and 1891 noticed the same thing, we had not seen it mentioned in any English journal. The earliest of the sorts under trial showed proof of an extension of their time of growing under the copper treatment, while a late one—Prodigious, a vigorous grower—did not give up until the third week in September. On digging the lots and picking out the diseased Potatoes from each lot, the result was most convincing. In all the sorts the 8 feet of the drills treated on the Janssen principle were a little diseased more or less, and the crop was, owing to the growth being checked, rather light. The 44 feet in the middle had, in some of the sorts, suffered most severely. But, on crossing the line and coming into the copper-treated territory, the crop was heavier in all the sorts, and the disease reduced to a minimum, in one case—that of Prodigious—not a diseased tuber being found. Comparing the result of the different courses of treatment, it may be put thus:—For the Bordeaux mixture, 6; for the Janssen method, 4; and for the 'leave to nature' policy 3; taking these figures to represent the proportionate yield of sound tubers. In short, the French remedy proved with us an unqualified success, for it acted as a preventive where the disease had not yet appeared, and as a cure where it had done so, at the same time showing itself to have had a fertilising effect as well, by prolonging the growing period, especially of those sorts which were naturally late in maturing." As has been remarked in this Journal, an extensive and successful grower of Potatoes for market, who is alive to most things that pay, says, in his opinion, it is "better to grow the strong than doctor the delicate."

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers.

Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*F. G. W.*).—1, *Nellia opalifolia*; 2, *Philadelphus Gordonianus*; 3, *Andromeda speciosa*; 4, *Genista virgata*. (*J. S.*).—1, *Bromus sterilis*; 2, *Doronicum austriacum*; 3, *Veronica rupestris*; 4, *Bromus brizæformis*; 5, *Viburnum Opulus*; 6, *Rose Persian Yellow*. (*A. C.*).—It is *Olearia Haasti*. (*C. N.*).—A *Eucomis*, probably *punctata*; see Correspondence. (*T. L.*).—1, *Rhus cotinus*; 2, *Cornus Spathi*; 3, A form of *Ulmus montana*; 4, *Cassinia fulvida*; 5, *Choisya ternata*; 6, *Spiræa Thunbergi*; see Correspondence. (*M. F. C.*).—1, *Adiantum Weigandi*; 2, *A. gracillimum*.

COVENT GARDEN MARKET.—JULY 20TH.

HEAVY supplies now to hand of sieve fruit, realising fair prices.

DAIRY COWS.

"THE cows are gadding through fly to-day, there will not be much milk to-night," said the wife of a dairy farmer on whom we called recently. She was naturally anxious, for though the season proves to be so good a one for cheese-making, it began badly, the milk yield being so low at the outset that in April and May, the first and second months of the cheese season, the

number of cheeses made was much below the average. With more herbage, and warm, not hot, weather in June, the milk yield improved so much that the cheese average was closely approached by the end of the month. July, with its sultry afternoons, when gadflies bore into the cows' hides, is a very trying month, the pain from the terrible blood-suckers causing the frantic animals to rush about with tails erect, the excitement of their efforts to escape from the flies telling so seriously against milk secretion that there is always a considerable falling off in quantity on such days.

The remedy for the mischief is simple and obvious enough. Keep cows in covered yards or cowsheds on very hot days, with water, rock salt, and racks well supplied with any such nourishing green food as Tares, Clover, Lucerne, Sainfoin, the best meadow grass, or "seeds." If mixed meal is used by all means give them some while they are kept in. With such shelter and plenty to eat there will be a full yield of milk at the evening milking, after which the cows are turned out to graze, and repose in comfort through the night.

It is strange indeed that any and every available means of shelter are not turned to account in this way, but they are not. We built commodious cowhouses replete with every convenience in a central position out on the pasture, close by a pool of good water, for two of our tenants in June, yet we are told they are not required for use till autumn. It is not the custom of these particular graziers to try and protect cows from gadfly attacks. They came to us complaining of deficient accommodation for cows on their holdings, yet have not sense enough to turn the new cowhouses to account which have been provided by a generous landlord with such promptitude and liberality in response to our appeal. The only idea such men appear to have of shelter is to have the cows indoors during very rough weather in winter; the possibility of turning shelter to profitable account in summer is too novel and high a flight for their prosaic imaginations.

Good management includes every point at all likely to affect the health of the cows. They show plainly enough how much they suffer from the gadflies. We ought to know that by keeping them in during sultry weather the worry and consequent loss of milk is avoided now, as well as the subsequent suffering from warbles in winter and spring. Complaints of the long hard winter, late spring, and consequent short commons for the cows have been frequent enough of late; let us see that we are not wanting in anything—any point of management at all calculated to affect the cows for good. No doubt they possess great powers of endurance, but are we wise to test them as we do? Surely it would be altogether better for the cows and better for us to act more upon the principle of prevention, and so avoid the waste of vital force, which goes on throughout the year more or less in so many herds. The term waste is singularly appropriate and comprehensive in relation to ordinary cow management. We certainly waste the powers of a cow by mismanagement, by unwholesome or insufficient food, by exposure to extreme cold, or heat, or flies, and by unsanitary buildings. In striving to amend let us not only do our best for the cows now, but also look forward a little and see what can be done for the better promotion of health and comfort in winter. No time could be better than this. We are engaged in making provision of food and litter for winter now; let us see if food, water, litter, and buildings are such as are calculated to answer them in the best way.

In the buildings we require thorough drainage and ventilation, hard dry floors, and the exclusion of cold draughts. The food should be heat-giving if we would have it fully nourishing. A winter dietary of roots, or into which roots enter largely, is most costly both to cultivate and use. No crop is so expensive as a root crop; nothing can be more trying than a meal of half-frozen roots, which lowers the temperature of the cow's body so much that most of the actual nourishment of the food goes to restore the vital heat which has been wasted by our folly. Of course the

roots are not always frozen, and they are sometimes used with moderation and judgment. Granting this, we would have roots regarded as only an adjunct to the winter dietary and not as its chief constituent.

Beware of unsanitary buildings. It is notorious how much more disease there is among cows than in any other class of farm stock; nor is it surprising, when we see such filthy, foul hovels as are so frequently to be met with. The poor animals stand and lie down in filth all the winter, they breathe the foul air of an ill-built, badly ventilated shed till their lungs become as diseased as their hides are foul with filth. This is one reason why a medical friend of ours has all milk received in his house sterilised by boiling before it is used. He is positive that the cause of many a case of consumption in human subjects can be traced to drinking impure milk.

WORK ON THE HOME FARM.

Where root crops are grown upon the home farm for market as well as for supplying the household, early and second early Potatoes should hold a leading place, especially in southern counties. Early field Potatoes in Essex were being lifted briskly on July 11th, when the price was a penny a pound in the retail shops; if growers realise half that amount upon a crop of say 10 tons an acre, they certainly have no occasion to complain of hard times. With the Potato crop off the land so early it is ready for Celery and Lettuce, or Turnips, or better still for autumn Onions, which ought always to be sown by the third week of July instead of the sowing being left till August, as it often is. With the haulm fully 2 feet in height the Potatoes have to be lifted with light steel forks. Men and boys were all working with a will, and would evidently not be long in clearing a few acres of the fine crop of tubers, which were without a blemish. That is another advantage of growing early Potatoes; they are off the land before the disease appears, and the growers require no *bouillie bordelaise* or any other nostrum. Their chief care is to have rich land and carefully prepared seed, then a full and early crop is a certainty. There must be no heaping up of the seed or burying underground; rather should it be spread out upon the surface for the skin to harden, and then placed on trays or shelves in single layers in a frost-proof building.

Much good hay continues to be made, and so far the season bids fair to be more favourable to the farmer than the last three have been. Late springs and wet haysels have brought bankruptcy upon many a man, hence our frequent advice to keep the head of live stock well within due bounds. So far hay has had preference to silage, but if the weather becomes broken the wise course would be to revert to ensilage at once. Before all things we must have plenty of wholesome food for winter use. Silage is wholesome, and cheap food too, which ought always to be to the fore in a moist climate. Implements for hay-making are useful on all farms, they are especially so on small farms where with a two-horse mowing machine, a tedder, and horse rake, we recently saw father and son practically independent of hired labour. Such independence has gradually come to be a necessity since settled labourers became so scarce. It is true there are always "gentlemen of the road" to be had, but such aid as they afford is a very doubtful blessing indeed.

Do not forget to use a sack stuffed with straw drawn up the middle of the hayrick to make a funnel to admit the free escape of hot air from hastily built ricks, or where the hay has been carted before it was quite dry.

REMARKS.

- 10th.—Overcast morning, frequent sunshine in afternoon.
 11th.—Overcast morning, but frequent sunshine in afternoon; cloudless evening.
 12th.—Occasional sunshine in morning, showers in the afternoon.
 13th.—Heavy rain between 2 and 3 A.M., overcast all day, rain at night.
 14th.—Overcast throughout, with drizzle in morning.
 15th.—Dull and gloomy throughout.
 16th.—Generally overcast in morning, frequent sunshine in afternoon.
 An average week, but very little sun in the latter part.—G. J. SYMONS.

WITH the beauty of July around us we long for a portion at least of that gift which enabled the late Richard Jefferies to write thus of the Birdsfoot Lotus—"Here by me is a praying rug just wide enough to kneel on, of the richest gold inwoven with crimson. . . . It is, indeed, too beautiful to kneel on, for the life in these golden flowers must not be broken down even for that purpose. They must not be defaced, not a stem bent; it is more reverent not to kneel on them, for this carpet prays itself. I will sit by it, and let it pray for me. It is so common, the Birdsfoot Lotus, it grows everywhere; yet if I purposely searched for days I should not have found a plot like this—so rich, so golden, so glowing with sunshine."

CORONILLA IBERICA.

It is some months since I read the above words, and to-day, looking round my garden and examining a good plant of *Coronilla iberica*, which bears a considerable resemblance to the Lotus, they flashed across my mind, and I could not refrain from searching for them and quoting them here. This trailing *Coronilla*, though lacking to a great extent the crimson which mingles with the gold of our native plant, has beauty in plenty to excite our highest feelings of admiration as we see its deep yet bright green pinnate foliage trailing over the rockery and bearing many Lotus-like flowers arranged in the form of a crown, whence the name *Coronilla* from *corona*, a crown. *C. iberica* is one of the best of our yellow-flowered rock plants, beginning to bloom here in June, and continuing in flower for a considerable period. As the specific title would lead us to infer, it is a native of Iberia, whence it was introduced in 1822. It is deciduous, and grows freely in any light soil, being seen to best advantage if planted where it can hang over a stone. I have not yet propagated from my plant, although I have had it for some years. Although propagation by means of cuttings is said to be practised, it does not look as if it would lend itself readily to this method of increase, and I should prefer raising it from seeds. It seems to remove readily in early spring.

CAMPANULAS.

Many of the Campanulas or Bellflowers are in bloom at present, and many of my readers will agree with me that we have few more attractive flowers of the month. The species and varieties are so numerous that a detailed notice of those I have grown must be left until another time. There is one, however, I have under the name of *C. cenisia*, the Mont Cenis Harebell, which is so attractive that I feel constrained to speak of it briefly, although it is possible that I may have it under a wrong name. Fancy a little plant with somewhat hairy foliage, and when in full flower only about 2 inches high and bearing many solitary flowers which, when in bud, look like large, porcelain-coloured, enamelled beads, and are when fully open about 1 inch deep and 1½ inch across and of a pale yet bright blue. There is a strong resemblance in some respects to *C. turbinata*, but at the same time the plants are quite distinct, the flowers being deeper and of a different form, although, like those of *C. turbinata*, they are erect. *C. cenisia* is said to prefer slate in the soil, and my plant is growing in a pocket of the rockery which has the surface of the soil "mulched" with pieces of slate broken small. A writer on Alpine flowers

has said that *C. cenisia* did not seem to be an attractive kind in its native home. Whatever may be the case there it is one of the most beautiful I have yet seen. Another pretty variety for rockwork is one I have under the name of *C. Portenschlagiana* and which is said to be synonymous with *C. muralis*. This has bright green smooth foliage and small deeply cut semi-pendent flowers of a bright blue. It is a good grower and gives very little trouble.

As regards its identity with *C. muralis*, I have for some time been endeavouring to get hold of plants under the latter name, and in every case they have been identical with *C. Portenschlagiana*. Another plant is, however, figured in Maund's "Botanic Garden," and in the notes accompanying the illustration the question of the identity of *C. muralis* and *C. Portenschlagiana* is discussed. It is said to have been named *C. Portenschlagiana* by the German botanists Roemer and Schultes, but to be quite distinct from that species as figured in the "Flora Græca." Another excellent illustration of *C. muralis* appears in Wooster's "Alpine Plants," and the plant there figured seems to be identical with that given by Maund. Wooster says: "Two states of this species (which is sometimes found under the name of *Portenschlagiana*) are described by M. Alphonse de Candolle, the one quite smooth, the other velvety with down." The plants I have had under the names of *Portenschlagiana* and *muralis* are, however, quite distinct from those figured in the above works, as the flowers are more campanulate and more uniform in colour. I should, however, be glad to have any information regarding the *C. muralis* of Maund and Wooster.

Though July has many gems in the way of flowers for the rockeries, her glory is more fully revealed in the many more showy flowers she reveals to our admiring eyes. Carnations, of which Shakespeare says,

"The fairest flowers of the season
Are our Carnations and streaked Gillyflowers,"

begin to open their beautiful and fragrant blooms to enchant us with their form, their colour, and their perfume. The Lily, too, has her standard bearers of various forms and colours, and very decorative are many of these in the borders. Alexander Montgomery speaks of the Lily—probably the Madonna Lily, *L. candidum*—in glowing terms, saying:—

"I love the Lily as the first of flowers
Whose stately stalk so straight up is and stay;
To whom th' have ay lowly louts and cowers
As bound so brave a beauty to obey."

ERYNGIUMS.

Curiously beautiful are some of the Eryngiums or Sea Hollies, which one is glad to find so rapidly gaining ground in public favour. One of the finest of the blue-tinted forms, and one of the easiest to grow, is *E. alpinum*, the Alpine Eryngo. This has somewhat large leathery leaves and heads of fine deep blue, so beautifully feathered and cut as to look as if made of feathers coloured with blue. Scarcely less attractive, if not equally fine, is *E. Olivierianum*; it is of a different shade of blue and with deeply cut leaves. It is unfortunate that there exists a good deal of confusion regarding the names of the various Sea Hollies. My plant of *E. Olivierianum* was received under the name of *E. amethystinum*, which is a small-headed species, and I saw a short time ago two or three plants of Eryngiums received for *amethystinum*, which, although not in flower, appeared to be distinct from each other.

CENOTHERA YOUNGI.

In fitting contrast to the blue of the Eryngiums and of the taller Bellflowers is the beautiful *Cenothera Youngi*, one of the best of the taller perennial Evening Primroses. It grows here to about 3 feet in height, and is very conspicuous at present with bright green leaves, crimson stems and calyces, and bright golden

yellow corollas. It has been in flower for some time, and its many unopened buds show that its time of beauty is not nearly over. Not one of the least of its recommendations for garden purposes is that it is not one of the evening bloomers, but seeks the full light of the day, and glitters in the sunlight. I must, however, stop, as I have a journey before me, and have only a few hours left for much-needed work in the garden. There, among the flowers, in the bright sunshine of July the time will pass pleasantly, for Nature's children are around us decked in robes of her own handiwork, and dyed with inimitable colours. There the whites of *Sidalcea candida*, of *Lychnis vespertina alba fl.-pl.*, and of many others stand out among the lilacs and blues of the *Campanulas*, the *Cornflowers*, the *Sea Hollies*, and others of similar shades, which seem as if abstracted from the skies above. There, too, are reds and purples, pinks and roses, yellows and creamy shades innumerable, all delighting our eyes, even if unaided by the charms of the elegance of the flowers themselves or their graceful habits, and all combined giving an enjoyment which surpasses any to be found in other pursuits, for, as Bacon tells us in his familiar words, "It (a garden) is the purest of all human pleasures."—S. ARNOTT.

A WEEK'S DINNER-TABLE DECORATIONS WITH HARDY FLOWERS.

(Concluded from page 23.)

THE night following that on which pink flowers were used it was decided to have white only. Crimson silk was laid up the centre of the table; around this were arranged well-selected pieces of *Cryptomeria japonica*, the two ends being extended beyond the silk and brought round with a curve to the centre, so as to form the arc of a circle. Three tall stands were then lightly filled with *Marguerites* and white Pinks (Mrs. Sinkins), plenty of Fern and *Asparagus* being used for the base, and wild Grasses and *Cyperus alternifolius* among the tops of the flowers. Eight plates were then filled with sand, covered with *Maidenhair Fern*, and arranged lightly with exactly the same kinds of flowers as those in the central stand. Great care was taken to have them well finished—i.e., to secure a light surface, and still have the stems well covered at the base, so as to make them appear to be really growing from the green setting. The same kinds of white flowers were then dotted about at intervals around the tracing, bunches of them being arranged at the corners, and the work was completed.

An entire change of company being present on the succeeding night, it was decided to use pink *Pæonies* again in consequence of their having been so effective when previously employed. The stands and ornaments used on this occasion were gold. The table being larger the arrangements were worked out in a totally different style, and although the materials used were almost identical with those employed when the handsome silver bowl and vases already mentioned were brought into use, yet the contrast in appearance was complete, and proved on the whole to be one of the most showy and beautiful tables of the series. The three stands placed down the centre were those filled on the previous night with *Marguerites*; but were much more effective when arranged with *Pæonies* of a telling pink colour, half-opened buds as well as full-blown flowers being intermixed with field Grasses, Ribbon Grass, *Asparagus*, and Fern fronds.

Twelve groups of moss, each with a small Palm in the centre, were formed into groups on the table, so as to avoid anything approaching a straight line. These groups were varied in size to suit the space at command, and when finished they formed a series of recesses around the table of the right size to admit the principal dessert dishes to be placed in them. Each group was finished off by placing a few *Pæonies* and Fern fronds upon it. Long trailing pieces of *Asparagus tenuissimus* were then used to form a continuous drooping chain along the centre of the table, connecting the candelabrum and floral stands, Fern ends being allowed to trail down to the cloth here and there. *Maidenhair Fern* and *Madame Crousse Pelargoniums* were placed around the dessert dishes, but no other tracing of any kind was used. An imposing outline and undulating surface and an unimpeded view were characteristics of this display.

The following night the silver set was again brought into use. Yellow silk having been placed up the centre of the table and edged with golden Yew a capital groundwork was attained. A large bowl was used for the centre, a candelabrum on each side, and a good sized cup for each end. In the latter, as well as the bowl, *Rhododendrons* of the ponticum type were thinly arranged. The flowers

having the deepest colours were selected, good large trusses being used at the base and smaller ones towards and at the top. A few flowers of the bright yellow *Iris Pseud-acorus*, cut with long stems, were then thinly arranged among the *Rhododendrons*, some of their more deep green sword-shaped leaves being placed with them, and the whole finished off with a light Grass here and there. Palms with *Lycopodium* bases were then disposed about the table in pairs, and the tracing and dishes dotted with trusses of *Rhododendrons* of various sizes, reserving large full ones for the corners and wherever cross lines occurred.

On the final night a combination of pink and white flowers was used. A tall stand placed in the centre was very lightly arranged with pink *Pæonies* and *Marguerites* (cut with long stems). On each side of this, circular pieces of stiff brown paper, 2 feet in diameter, were placed, a tall plant of *Curculigo recurvata* with a single stem being stood in the centre; mounds of moss were formed around these, and some good bold fronds of *Lastrea Filix-fœmina* placed around the base, laying them flat upon the cloth with the points outward, the other end being pushed under the moss. The fine outlines of this useful Fern was then shown off to advantage. Pink *Rhododendrons*, white *Marguerites*, and *Asparagus* were then arranged lightly upon the moss, care being taken that although the flowers were thinly disposed the moss was completely hidden by the *Asparagus*. Eight very small Palms set in *Lycopod* were then arranged so as to form a curving line around the table, two others being placed on each side of the central stand at its base. Candelabra stands, dessert dishes, and Palms were then traced round with small sprays of *Weigela rosea*. This tracing was only broken at the points where it reached the flower banks. At those points the large Fern fronds laid upon the cloth protruded some distance behind the curving lines formed by the *Weigela*, and gave the whole a striking appearance.

As may be gathered from the above description everything upon the tables was virtually wreathed in an almost unbroken winding curve of *Weigela*, the delicate flowers of which looked especially beautiful when seen under artificial light; and although the arrangement was simplicity itself, personally I preferred it to any other in the series of dinner-table decorations.—D.

OUTDOOR PEACHES.

I NEVER saw these more promising than at the present time. All the varieties have abundance of fruit, which is swelling satisfactorily. All that is needed now is bright weather to ripen it and give it flavour. After the experience during the last season's flowering I shall not mind a degree or two of frost while the blossoms are open in the future. As an instance of how much frost Peaches will stand uninjured while in bloom on the open wall facing west we have three trees at Swanmore—Alexander, Dymond, and Early Louise, which, without any protection whatever, were exposed to 7° of frost. The trees are now carrying a full crop of fruit, apparently none the worse for their experience. All our Peach trees outside were subjected to the same frost, although with these exceptions they were covered with coarse scrim. Royal George on an eastern wall has a full crop of fruit, and so has Princess of Wales; while Hale's Early, Alexander, Grosse Mignonne, Bellegarde, and Walburton's Admirable growing against a south wall have had to be relieved several times of their surplus fruit, so freely did it set.

For the first time in a dozen years the trees escaped their usual spring crop of blister, which is mainly owing to the fact that at the period of their growth when they have hitherto been attacked we experienced no cold easterly wind as is usually the case. This, in my opinion, is the cause of blister, and its non-appearance this year is the result of their absence. The trees are now making free but not too robust growth. The shoots are being tied to the wires, thus exposing the fruit to more sun than it is possible for it to get where the young growth stands away from the wall. The great error committed in outdoor Peach culture (I know it is so here) is retaining too many shoots at this time of the year, which have to be severely thinned at the spring pruning, or after the fruit is gathered. The latter is the best time of all to prune Peach trees, cutting out the weakly growths that have borne fruit to give more space to others, which will have a better opportunity of maturing before the end of the present season. The fruit of the early kinds already shows signs of ripening. Any overhanging leaves ought to be removed to expose the fruit more fully.

We encourage surface rooting by a continual mulching of the border 4 feet wide from the wall, the soil of which is now pretty firm, not having been disturbed for ten years at least, and it is being constantly trodden upon. The front of the border is occupied with herbaceous plants, necessitating a path at the back for convenience in attending to the plants as well as the trees, an

arrangement all in favour of the Peaches, judging from the results of the treatment accorded. Outdoor Peach trees do not receive enough attention in the matter of moisture at the roots and overhead during hot and dry weather in a general way. Nightly drenchings of the foliage when hot and dry are all in favour of healthy leaves, free from red spider. This insect does much mischief if allowed to establish itself firmly on the leaves of the trees.—E. M.

ORCHIS FOLIOSA.

THIS very charming Orchid is a native of Madeira, but is quite hardy in England. Care should be taken to prevent the plants becoming very wet in winter. If planted in a rockery *Orchis foliosa* should have at least a depth of 12 inches of soil to grow in, and should be shaded from the midday sun. Probably the best and safest plan, however, is to plant several tubers in pans about 8 inches across, in loam and leaf soil; these should be placed in a cold frame during the winter, and in the spring the pans may be plunged in the rockery or taken to the conservatory as circumstances require. In either case they are exceedingly attractive and handsome. The leaves are long and bright shining green, the spikes growing 1½ to 2½ feet high, with 6 to 8 inches at the apex crowded with purplish lilac flowers. A batch of *O. foliosa* form an attraction in the greenhouse at Kew at present, and several good pans may be seen in the Royal Horticultural Society's Gardens at Chiswick.—C. K.

NEW AND OLD ORCHIDS.

THERE is one regrettable feature in the craze for new Orchids, and this is the fact that it leads to the neglect of older kinds. It is notorious that many of the most beautiful and valuable of Orchids are a source of very little profit to dealers owing to amateurs perpetually thirsting for something new. The latter carry this desire for novelty to such an extent that they will hardly look at anything that is not entirely fresh, reserving all their attention and admiration for every stranger that happens to be introduced, even if it is unflowered and its merits a matter of conjecture. As we must in the main rely upon old friends, whether they be fruits, vegetables, or Orchids, until the new have proved themselves to be better, it would be well if those who have not yet yielded to the fascinations of novelty-hunting would take care to have something reliable with which to fill their houses. When they have made sure of a reliable collection will be the time to look about them for new things, and if the latter fail then they will have something to fall back upon.—P.

CALANTHE VEITCHI.

THIS is one of the most useful winter flowering plants that it is possible to take in hand, and when we consider how few are grown in private gardens where flowers are required during the months that *Calanthes* are in bloom it is a matter for wonder. It might be inferred from this remark that I am unaware how much attention is paid to it in some gardens, where its value is known and appreciated, but I am speaking broadly of the hundreds of small gardens where not one can be found. Even if there be plants they are in such a wretched condition that such a thing as a presentable flower spike is out of the question. Gardeners should not go on in ignorance of the quality and beauty of this simply grown Orchid. Anyone with a Cucumber house, a Melon house, or a plant stove can have satisfactory examples of *Calanthe Veitchi*. The present is the time when the plants need attention to induce the new bulbs to swell to their fullest extent, and upon these the quality of the future flower spikes depends. Abundance of weak tepid liquid manure is what this *Calanthe* enjoys. Where the pots are not too full of soil cow manure, not too much decomposed (or the goodness will have left it), laid on half an inch thick, is one of the best stimulants it is possible to give. A few of our plants showed signs of a paleness in the foliage a fortnight since, but a mulching as described quickly gave the wanted colour back to the leaves.—E. M.

DENDROBIUM TRANSPARENS AND VAR. SOUVENIR D'ALEC.

DENDROBIUM transparens is supposed to have been discovered by Dr. Wallich in the Himalayan valleys, and later on in 1852 by Thomas Lobb, one of the collectors for Messrs. Veitch and

Son of Exeter. It blooms in April and May; the flowers are about 1½ inch across, and borne in pairs on terete stems about a foot long. The petals are white, tipped with mauve; sepals the same colour as the petals; the lip is oblong and rounded, white with deep purple stains, and mauve at the apex. The flowers are curiously transparent. This species belongs to the well-represented *Fasciculata* section of the genus *Dendrobium*. It is deciduous, and thrives with the same treatment generally given to the well-known *D. nobile*.

D. transparens, var. *Souvenir d'Alec*, was exhibited at the Drill Hall, Westminster, on Tuesday, June 21st, 1892, and is a pure white variety of *D. transparens*. It was exhibited by Mr. Hamilton, gardener to Hamar Bass, Esq., Byrkley, Burton-on-Trent, in whose collection it flowered for the first time, and it is the only plant at present known of this lovely variety. We understand from Mr. Hamilton, the gardener at Byrkley, that the plant was

FIG. 10.—DENDROBIUM TRANSPARENS VAR. SOUVENIR D'ALEC.

purchased from Messrs. F. Sander & Co., St. Albans, who imported it, among other things, from the East Indies. Handsome varieties are often to be found among imported Orchids, and this is certainly one of the best that has appeared of late. It is named in memory of a son of H. Bass, Esq., and was given an award of merit by the Royal Horticultural Society. The flowers are pure white, the stems greyish, and the growth is similar to that of the parent.—C. K.

HOEING VERSUS MULCHING.

EVEN in our strong land I find that crops of any kind, vegetable or otherwise, are much improved by mulchings of light stable manure, Peas especially being benefited by such treatment. Our Gooseberry crop, which has never failed us yet, has shown the

benefit derived from mulching this season. Owing to the extremely dry weather experienced at the time the fruit had arrived at bottling size the foliage was attacked by red spider, which caused the swelling of the fruit to come to a standstill. Having some partly decayed manure at hand we mulched all the trees, afterwards giving them a good soaking at the roots with clear water and a vigorous washing with clean water applied by the garden engine. A change for the better was quickly apparent, and the crop is better now than at any period within the last thirteen years, although the Gooseberry crop has always been considered a remarkable one. My object in laying on the manure before watering the trees was that the good qualities of it might be washed down to the roots of the trees, thereby benefiting them much more than if the moisture was allowed to evaporate into the air. The manure afterwards conserved the moisture in the soil. This is an instance of a case in which I do not think that stirring the surface soil with the hoe would have had nearly so beneficial an effect as the mulching. Stirring the soil between the rows of young crops, such as Onions, is no doubt good where it is not wise to mulch, but the treatment best accorded to such crops as Peas and Beans is quite another question.

In my opinion the two methods are wide apart, both being good in their way. Who would think of mulching such crops as Carrots, Parsnips, or Beet? Very often the last named is growing in land already too rich, and to mulch such a crop with manure would be making matters worse. In going round various gardens and allotments this summer, many situated in a chalky district where soil is thin before the solid chalk bed is reached, it was pitiful to see the lines of Peas turning yellow long before they had reached the flowering stage owing to the lengthened drought. Surely in such instances as this a mulching of manure, grass, or even straw, would have done more towards saving the crop than all the hoeing in existence.

Light soils are not nearly so much benefited by frequent stirrings of the surface as those which are heavy, for the reason that they do not crack nearly so much as soil which is naturally retentive; these instead of crumbling by the effect of drought crack through contraction. Light soil does not contract in the same proportion as does that which is heavy.—E. M.

THE OLD FLOWERS AND THE NEW.

CARNATIONS AND STREPTOCARPUS AT CHELSEA.

THERE is often hopefulness in contrasts. In comparing the early stage of one plant with the developed beauty of another, belief is prompted that what has come about with the one is not impossible with the other. Taking this view, it is interesting to place old flowers and new mentally side by side, and let the realities of the first give faith in the possibilities of the second. In the great Chelsea nurseries of Messrs. J. Veitch & Sons there are now two special features, the one under glass, the other in the open air, the one old, the other new, and it is impossible to go from the former to the latter without the comparison indicated suggesting itself. The Carnation is an old friend, worked up to its present high standard of beauty and usefulness by many years of patient work; the Streptocarpus in its hybrid forms is new. We value the one as a friend of proved worth and steadfastness; we look on the other hopefully, as one that will do us good service when it has spent its novitiate under the skilled hands of the hybridiser.

It would be unwise to suggest that high water mark has yet been reached with Carnations and Picotees. Each year still brings its quota of novelties. But we must now be content with the steadiest of progress, for we are very far on the road. The material has been acquired, and hardly admits of more than a polishing-up. That this is being steadily practised we see in looking over a good collection, such as that in the Chelsea nurseries. There are old favourites in plenty, but there is also a sprinkling of something fresh to excite comment. Moreover, the lesson is to be learnt that many varieties possess a double usefulness. Take for example Winter Cheer, which, by the way, is admirably named. It is so largely grown under glass and so widely esteemed for blooming during the dull months of the year that it is unnecessary to enlarge on that phase of its usefulness, but it may be assumed that many who so cultivate it are not aware of its great value for flower garden decoration. This, however, should be known. In a very large and comprehensive collection it stands out conspicuously as one of the very best bedders, and invariably arrests attention. It is dwarf, compact, very free, and noteworthy for its brightness in colour, which some might call scarlet, others crimson, but which is perhaps best described as a mixture of both. Border Maid is another to which the same general remarks apply. It is a charming variety, to be sent out this year. In habit it is dwarf and compact, in floriferousness it leaves little to be desired. The flowers are well formed, deep rose in colour, with a lighter shade on the edge of the petals, and very sweet; moreover, it is one of the perpetual-blooming race. It is more than likely that it will prove useful for pots; it is certainly excellent out of doors.

Mrs. Frank Watts is pretty well known by this time, having taken a high position among the whites. It might almost be said that, if compelled to select one as the best, this would be the chosen flower, although few would care to disparage such beautiful and well tried varieties as W. P. Milner and Mrs. Donaldson. In Mrs. Frank Watts we have a combination of desirable qualities—good habit, freedom of blooming, neat form of flower, and purity of colour. L. H. Pomeroy is a fine dark Clove-like bloom of good form and a useful winter variety. Magnum Bonum is not new, but it is very free, and is still one of the best scarlets. Rose Celestial, too, is not yet surpassed in its colour, and it has beautiful form to recommend it. Dr. Parke is another good rose, being a wonderful bloomer and of good form. William Toby is velvety purple, very dark. Alice Ayres can hardly be termed a self, as the white ground is lightly flaked with rose. It is a charming variety, and very valuable for cutting. Joe Willcett remains one of the most brilliant reds. Beauty of Foxhall is one of the best of the purples, having a glowing magenta tinge that makes it wonderfully bright. Professor Goodhart may be classed as a Fancy rather than as a Picotee. It is a yellow ground with crimson edge, but somewhat splashed and flaked. Almira, a yellow ground Fancy of fine form, is a beautiful variety. Dorothy, buff ground with deep rose flakes, is also charming. Ruby (Turner), is a brilliant ruby red, with a good petal and admirable form. Queen of Bedders (Turner), light scarlet, good shape and fimbriated, is very free and delightful for cutting. Cara Roma is a rich purple, very large and good. Germania is well known as a splendid yellow, and there is a beautiful bed of it. Grant Allen much resembles Brilliant, but is superior in not splitting the pod. It is rich rosy crimson. Maggie Laurie is a charming little rosy pink fimbriated bloom. Leander is a bright yellow that stands the wet wonderfully well, but spindles up 3 feet or more. John Barnett is a finely formed bloom of a very rich rose shade; an old favourite. Crimson Pet is splendid in colour, a rich velvety crimson, but inclined to be small. Mrs. Reynolds Hole is prominent, and so are the crimson and blush Cloves; while Amy Herbert, rich rose, a fine full flower, is also noteworthy.

The Picotees and florists' Carnations, flaked and bizarres, are a very strong contingent, all the best varieties being represented, and saying this obviates the necessity of merely multiplying names. It is satisfactory to note that severe thinning of the buds is not practised, so that the true qualities of the varieties as bedders is clearly seen. The plants are admirably grown, and are grouped in a series of beds near the Fulham Road entrance to the nursery, where they make a beautiful display.

From the old flowers we turn to the new, and it is quickly perceived that the possibilities in Streptocarpus are already removed from the ground of mere speculation to something practical and tangible. In the able hands of Mr. John Heal marked progress has been made, and nothing will be more interesting than to watch future developments in this already valuable and beautiful flower. There is perceptible advance in size of bloom for one thing, and there will no doubt be further improvement in this respect every season. That it will be at the expense of free flowering there is little fear, for Messrs. Veitch's hybridiser is as fully alive as any of those who may examine and criticise his handiwork to the importance of avoiding any such sacrifice. So far as regards bulk of bloom the Streptocarpus may never be got to the Gloxinia stage, but it will not matter if they stop short of that so long as their floriferousness is unimpaired. Diversity of colour, too, is increasing apace. We now observe violet, purple, deep mauve, rosy mauve, lilac, pure white, white with purple streaks in the throat, and—most important of all perhaps as marking an approach to the coveted scarlet—a bright rosy purple. There seems every reason to hope that red flowers will be in due time secured, although it may not be the work of a season or two. Be that as it may, a most valuable class is being rapidly evolved, and in the face of what has already been done we may rest confident that the future has something bright in store.

It will be proof enough of the accommodating nature and easy culture of the Streptocarpus to indicate the conditions under which they are growing at Chelsea. They are planted out in a long range of pits, the soil used being a mixture of peat, loam, and sand. There are upwards of 2000 of them, and they are brought well up to the glass, a constant current of air passing over them. The seed was sown in December, 1891, and the plants are now full of bloom. With the decaying flowers picked off to prevent seeding they would bloom continuously into October, for they keep throwing up fresh flowers, and after a winter's rest would bloom profusely again in March. A batch of plants that were in full bloom at the Temple Show had the flower stems cut down two or three weeks ago, and are again pushing up abundance of buds; in a short time they will be a mass of bloom once more. There is very little doubt that by sowing successions plants could be had in flower every month in the year. Their safety in winter does not demand a high temperature; on the contrary, 40° to 45° is quite sufficient to keep them in health, and as a proof of this it may be mentioned that some of the Chelsea plants had the foliage cut by frost last winter, but still bloomed. When grown under cool conditions they are not subject to insects.

In the face of the many good qualities hybrid Streptocarpus possess—beautiful and diversified flowers, handsome leafage, ease of culture, and continuity of flowering—it is not surprising to hear that their popularity is increasing by leaps and bounds. It can only be a matter of time for the new flowers to prove as valuable as the old.—W. P. W.

LARGE AND SMALL ROSE GROWERS.

REMEMBERING my correspondence of last year as to the desirability that each exhibitor should show only according to the number of plants he grows, it is pleasant to read that through the influence of Mr. Graham and Mr. Bateman their efforts and exertions have had such satisfactory results, and they, with others who assisted in so desirable an end, are entitled to the thanks of all the small Rose growing exhibitors (myself among the number) for surmounting the difficulties attending their task, and I now hope the affiliated societies will follow the good example set, and with the same satisfactory results.—AN EXHIBITOR.

NOTES ON THE NATIONAL SOCIETY'S SHOW AT CHESTER.

IN a climate so variable as ours, and in a month which has of late years shown an unpleasant tendency to wear more the character of April than of its own traditional bright warm suns, everything that depends on weather is doomed to experience vicissitudes, and consequently the National Rose Society, which holds its annual Provincial Exhibition in the month of July, has in its record of fifteen years to tell of bright and fine days, as at Hereford last year; but it has also had very frequently to tell of leaden skies, and damp, and unpleasant experiences. I am convinced that amongst our records the day at Chester will ever hold a prominent place for the utterly unpleasant and miserable state in which the members found themselves. From morning until late in the evening there was an unceasing downpour of rain, and as the Exhibition was held in a tent in a field where the grass was long, it may be readily imagined in what discomfort exhibitors found themselves. It was not possible to set up the flowers (as is generally done) in the open under the lee of the tent, all had to be done under cover, and it may consequently be imagined that there was no little difficulty. Thursday, the day originally fixed, was fine, and, as is generally the case when dates are changed, it turned out that it would have been better to have adhered to the original day, had that been possible, but apparently that could not be, and as in all such matters the Society submits to the guidance of the local authorities, the day was changed.

Having thus looked at the disagreeable side of the picture let us look at the Exhibition from the Rose lover's point of view; and here I have no hesitation in saying that it was the grandest Exhibition of the year, and I think also the very best both in extent and quality that the Society has ever held. It is of course always difficult to carry in one's mind the shows of former years, but I think my verdict is a correct one. When the season was about to open I had various letters on the subject, and my own opinion was not a very favourable one, and also even now it is very difficult to say; but this I venture to affirm, that Roses have been shown of such surpassing excellence that it would be hard indeed to say it was not a good Rose year. As usual some flowers were shown of such a quality as perhaps they had never been seen before. Ethel Brownlow, which had been so well shown at Hereford, was also exhibited in great beauty at Chester, and will certainly take a high position in its beautiful class, which it need hardly be said was seen in great perfection. It is a good Tea year, and when we have contests between such redoubtable growers as the Rev. F. R. Burnside, Mr. Hill Gray, and others amongst amateurs, and Mr. George Prince, the two Cants, and Messrs. Paul & Son amongst nurserymen, it may safely be concluded that the battle was pretty fierce and the contest very sharp. Madame Cusin was shown in excellent condition, and so also was Marie Van Houtte, some of the blooms with the exquisite lemon shading, and the pink edge to their petals were most lovely. Comtesse de Nadaillac also asserted herself, although I question whether in point of colour it was equal to what I have seen in other years from the same growers; neither did Anna Ollivier stand out so prominently, although it was very fine in Mr. Burnside's stand, who gets a colour into it one does not see elsewhere.

Comte Raimbaud as shown by the Rev. J. H. Pemberton was very fine, meriting the distinction it obtained of the National Rose Society's medal, while the Gustave Piganeau for which Mr. Merryweather obtained the like award was a splendid flower; but there was one flower in the same stand to which I should have been inclined to give the award, a glorious bloom of Gloire de Margottin. It was the most brilliant coloured Rose I ever saw, as near scarlet as anything could well be. Hitherto we have looked upon this flower

more in the light of a garden Rose than of an exhibition flower, but here it was fully up to this character, being full, deep, and large petalled, while the colour was magnificent. A stand of twelve of Gustave Piganeau, for which Messrs. Merryweather & Son obtained the first prize for the best twelve dark Roses of one sort, was very fine; but in truth there were so many grand blooms that it is difficult to particularise. One cannot omit, however, Her Majesty as shown by Mr. Frank Cant. Never has this Rose been shown to such perfection. It was large without being coarse, and its exquisite shade of colour made it very taking, but then one wonders how many plants there were and how many of the blooms were of this standard of merit.

There were not many seedlings exhibited, but they were of great interest, and it was felt by a good many that it was a great pity that the rules of the Society did not permit awards of first-class certificates to those varieties which were not deemed worthy of a gold medal. This coveted prize was awarded to Messrs. Alex. Dickson & Son of Newtownards, the raisers of Earl of Dufferin, Margaret Dickson, and other fine flowers, for a Hybrid Tea. Its mother parent was La France, which the late Mr. Bennett used to say would never bear seed. It is of a very beautiful shade of red, very free flowering, and likely to be a valuable garden Rose. It is devoid of that magenta tint which makes many Hybrid Teas most objectionable. There were two remarkable sports of Heinrich Schultheis exhibited by Messrs. Harkness & Son of Bedale, and curiously enough both off the same branch. One was an excellent white, and the other a beautiful striped flower, not like that dingy abortion Pride of Reigate, but more in the style of Village Maid, or what is ordinarily called York and Lancaster. This will, I have no doubt, be an effective garden flower if it remains constant. Mr. Swales had also a pretty Rose, of which we may, perhaps, hear more some day.

Everything that could be done was carried out by those who had undertaken to manage the Show—the Rev. Lionel Garnett, Mr. Laurence Garnett, and Mr. George A. Dickson; while the practical details were carried out by Mr. Taylor of Hoole Hall, with whom I had a pleasant chat about Auriculas, and Mr. Earlham of Christleton, while Mr. Jeffery carried out the Secretary's part efficiently under considerable difficulties. It would be ungenerous to close these brief notes without alluding to the kindness of the Mayor, who not only allowed the Show to be held in his beautiful grounds, but entertained the Judges and exhibitors at luncheon in his own house. In fact, as I have said, there was only one thing to be deplored, and that was the weather, but for that all would have gone merry as a marriage bell.—D., Deal.

STRAWBERRIES IN SCOTLAND.

Now that we are in the middle of our Strawberry harvest what are the lessons to be deduced from the season so far as it has gone, and how have the different varieties succeeded? As formerly, Garibaldi ripened a few days before Noble, as early as John Ruskin and far superior to it in quality. Garibaldi is, I consider, the best all-round early Strawberry in commerce for either market or private purposes. Noble has size enough (may not that be carried too far?) flesh very coarse, flavour poor, not a good carrying berry. John Ruskin is a better fruit than Noble in all points except size. It is not required for market where Garibaldi succeeds; in private use it will make an agreeable variety. Sir J. Paxton does not do in the heavy soil here. It grows well but produces few fruit.

Several others which I have tried will neither grow nor produce fruit—viz., Hammonia, Lord Napier, McMahon, President Delacour, Samuel Bradley, Sir C. Napier, and Triomphe de Paris. Waterloo is a good late fruit, but shy in forming crowns and runners; rather dark in colour for a market fruit. Of Marguerite I have grown a few for several years, but will not extend it. This and Noble, one of the retail dealers has told me not to increase because the fruit is so soft and the quality poor. President is our mainstay midseason variety, but this season the crop is poor both in quantity and quality. The cold, wet, stormy weather we experienced while the plants were in bloom has told very much upon the produce. Frogmore Late Pine is the best late variety I have tried, but is rather acid. I am testing several seedlings which, if any of them are prolific enough, will replace it for quality. The one I have sent for your opinion comes in between Frogmore Late Pine and President. Altogether this is the poorest Strawberry season I have had, the bloom appears fine but the crop is more than one-third short.—G. M. DOUGALL, *Ravenna Cottage, Stirling.*

[No Strawberries accompanied the communication.]

QUICK GRAPE GROWING.

I AM sorry to say we cannot get Mr. Gilchrist to come forward and open out the discussion upon the ninety-day Grape growing system. As amateurs are taking the matter up, and others not connected with the Sunderland Gardeners' Association, and as I know some gardeners have been told that they are burning coals and coke in

waste, and severely criticised by their employers, I enclose a letter which I sent to a local paper, the "Sunderland Herald and Daily Post." If you will please publish it in the *Journal of Horticulture* it may be the means of getting the opinion of gardeners on the subject. The following is the letter to which I invite attention:—

"On June 13th I noticed a letter in your paper upon the above subject, signed by W. Clark, as a member of the Sunderland and District Gardeners' Association. Like Mr. Clark I have had over thirty years' practical experience in Grape culture, and grown the fruit under many varying conditions, but have never been able to accomplish such a feat as to procure ripe Grapes in ninety days from the time of starting the Vines. I cannot believe without some strong demonstration that any gardener ever succeeded in such a feat, particularly with Vines planted out as I understand the ones under Mr. Gilchrist's charge are. I can assure Mr. Clark it is not the fault of the practical Grape growers of the Gardeners' Association that the subject has been hitherto kept so quiet. I cannot wonder at noticing a letter in your paper on the 18th July signed 'Amateur' upon the subject, as I know myself that gardeners in the district have been closely questioned upon it by their employers. Regarding the letter which appeared in your paper on the 19th from Mr. T. W. Bolam, I can assure him it is not the intention of the practical Grape growers of the Gardeners' Society to remain silent. If Mr. Richardson is able to give 'Amateur' the information he desires I am surprised the members of the Gardeners' Society should have been kept in the dark so long. I trust practical gardeners outside the Society will take the matter up and give their opinion upon the subject, as it appears to be of great importance, not only in this district, but to many others, as I have received letters from far and near upon it. I would ask Mr. Gilchrist if he would be kind enough to answer the following questions, which appear to be the main points:—

- "1, Time the Vines were started, and temperature.
- "2, Temperature after leaf expansion to flowering.
- "3, Date of flowering and temperature.
- "4, Date of colouring and temperature up to date of cutting.
- "5, Could Grapes be cut from day to day in a fit state for the table after the bunch cut on the 5th of May?—R. HONEY, *The Briery, Sunderland.*"

ROYAL HORTICULTURAL SOCIETY.

JULY 26TH.

RARELY has the Drill Hall presented such a gay appearance as it did on Tuesday last. Apart from the Carnation Show the exhibits were numerous and diversified. Insectivorous plants were plentiful, as also were hardy flowers and greenhouse and stove plants. Orchids were not so numerous as usual.

FRUIT COMMITTEE.—Present: P. Crowley, Esq. (in the chair), Dr. Hogg, and Messrs. W. Warren, G. T. Miles, A. Dean, W. Bates, J. Willard, G. H. Sage, A. H. Pearson, J. Hudson, F. Q. Lane, H. Balderson, G. Norman, J. Smith, W. H. Divers, T. Francis Rivers, R. D. Blackmore, H. Weir, W. Wilks, H. J. Pearson, J. Cheal, T. J. Saltmarsh.

Fruit was plentiful and well shown. Messrs. J. Veitch & Sons had a large and representative collection of Gooseberries comprising some choice varieties. The most notable kinds were Lord Derby, Dan's Mistake, Surprise, Highlander, Early Green Hair, Stockwell, and Fearless. Currants and Cherries were also shown by Messrs. Veitch, and a silver Banksian medal was recommended. Mr. Wythes had seedling Melons, as also did Mr. G. H. Sage, gardener to Earl Dysart, Ham House, Richmond. The latter was adjudged an award of merit for Melon Emerald Gem, a small scarlet-fleshed variety from America, and said to be very free fruiting. W. A. South, Esq., Neasdon, N.W., showed a dish of Carter's Perfection Tomatoes, also the Peach Tomato. A splendid collection of Peaches and Cherries came from Messrs. T. Rivers & Son, for which a silver-gilt medal was recommended. Nectarine Early Rivers was awarded a first-class certificate. Mr. R. Gilbert, Burghley sent some Royal Sovereign Tomatoes of a sensational size and weight. Six fruits weighed 10½ lbs. An award of merit was adjudged this exhibit. Mr. W. H. Divers, Ketton Hall, staged a collection of well-grown Peaches (silver Banksian medal), while Peaches and Melons were shown by Mr. Miller, gardener to Lord Foley, Ruxley Lodge, Esher. A collection of Melons and Peaches from the Royal Gardens, Frogmore, was staged by Mr. Owen Thomas. A bronze medal was recommended. Messrs. J. Hammond & Sons, Carlisle, showed fruiting branches of a Black Currant named "W. E. Gladstone."

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair), Messrs. O. Thomas, H. Herbst, B. Wynne, C. T. Bause, C. Ross, Norman Davis, J. Laing, and W. Watson.

The exhibits placed before this Committee were varied and of an interesting character. Messrs. Pitcher & Manda, Hextable, Swanley, Kent, sent a large collection of Sarracenias, Droseras, and other insectivorous plants (silver-gilt medal). Conspicuous amongst other species were S. Drummondii, S. Wilsoni, S. Nelsoni, and S. Mitchelliana. Hardy flowers were also shown by the same firm. Messrs. Sutton and Sons, Reading, had a beautiful display of their prize strain Gloxinias. The pure white variety Her Majesty, Duke of York, and a rich purple named Invincible Purple were very fine. Messrs. Sutton also staged a number of bunches of a new and interesting annual named Nemesis. The flowers of this embrace colours of various shades, from a creamy yellow to a rich crimson. It is a pretty flower, and will undoubtedly become popular. Plants of a dwarf Tuberous Begonia named Meteor

were also shown by the same firm. This was adjudged an award of merit, and is described elsewhere. Mr. Henry Brownhill, Mayfield Nursery, Sale, staged four bunches of a white Pink named Snowflake—a semi-double variety, useful for cutting. Mr. T. S. Ware, Tottenham, had blooms of Tuberous Begonias, amongst which Beauty of Belgrove (a charming pink double variety), Princess May, and Baronne de St. Didias were conspicuous. A splendid collection of Carnations, tastefully set up in bunches with their own foliage, came from Messrs. J. Veitch & Sons, Chelsea. The flowers were fresh, bright, and perfect in form. They comprise most of the varieties described elsewhere in the present issue. Messrs. Veitch also had Sarracenias in pans, and a box of their hybrid Rhododendron blooms, fresh and charming as usual. A silver-gilt medal was recommended. An interesting collection of Sarracenias was also staged by Messrs. B. S. Williams & Son. Mr. Eckford, Wem, Salop, had a number of Sweet Peas, the flowers being exceedingly bright and fragrant. Tuberous Begonia blooms, tastefully set up with Asparagus and Maidenhair Ferns, were staged by Messrs. Cannell & Sons, Swanley, the flowers being notable for their size and colour (bronze medal). Mr. Riding, Chingford, was accorded a vote of thanks for Gloxinia blooms, these being very fine.

Messrs. J. Laing & Sons, Forest Hill, staged a collection of Carnations, Picotees and Pentstemons, also a large collection of Caladiums, and a basket of a Tuberous Begonia named Scented Rose. A silver medal was recommended. Mr. G. Wythes, Syon House, showed bunches of Clethra arborea. Roses, Carnations, and hardy herbaceous flowers were shown in quantity by Messrs. G. Paul & Son, Cheshunt, this contribution making a bright display, meriting the silver-gilt medal recommended. Mrs. C. Jones (gardener, Mr. W. Barton) had a collection of Carnations, comprising twenty varieties grown in an open border in Kensington. The flowers were very fresh and bright. Sweet Peas, Shirley Poppies, and Carnations were shown by Mr. W. Wells, Earlswood, and a vote of thanks accorded. Martin R. Smith, Esq., Hayes Common (gardener, Mr. Blake), staged a group of Carnations in pots and a large number of cut blooms, for which a silver medal was recommended. Several varieties were adjudged awards of merit. Blooms of a new hybrid Eucharis named E. Clibrani were shown by Messrs. W. Clibran & Sons, Altrincham. The flowers are pure white, erect, and borne in clusters. Messrs. J. Green & Nephew, Victoria Street, E.C., showed a number of flower glasses and bowls of various shapes.

ORCHID COMMITTEE.—Present: H. Veitch, Esq. (in the chair); Messrs. J. O'Brien, J. Jacques, W. H. White, J. Douglas, E. Moon, C. Pitcher, T. Bond, T. B. Heywood, H. Ballantine, H. M. Pollett, A. H. Smea, S. Coatsworth, and E. Hill.

Orchids, if not numerous, comprised several interesting things. A small group was staged by G. R. Le Doux, Esq., Langton House, East Molesey, containing *Miltonia vexillarium* Klabrochorum, *Oncidium trifurcatum*, and others of a notable character. F. Wigan, Esq., East Sheen (gardener, Mr. W. H. Young), was awarded a cultural commendation for a fine plant of *Platychnis filiformis*. Mr. P. McArthur, London Nursery, Maida Vale, showed *Cypripedium superbiens*, and Welbore S. Ellis, Esq., Hazelbourne, Boxhill, Dorking, staged a plant of *Cattleya Rex*, a beautiful form, but scarcely so good as was anticipated. This is referred to below, it being awarded a first-class certificate. Norman C. Cookson, Esq., Wylam-on-Tyne (gardener, Mr. Murray), showed several fine *Cypripediums*, which are referred to below. A large spike of *Saccolabium Blumei* came from the Marquis of Salisbury, Hatfield House (gardener, Mr. Norman), and a fine spray of *Cattleya gigas* Sanderiana, from C. J. Lucas, Esq., Warnham Court, Horsham. Messrs. H. Low & Co. sent a small collection, which included a small piece of *Cattleya Schilleriana* Lowiana. This is an interesting flower, and was awarded a first-class certificate. H. M. Pollett, Esq., Fernside, Bickley (gardener, Mr. T. Paterson), also showed a plant of *Cattleya Rex*, which was likewise awarded a first-class certificate. Messrs. F. Sander & Co., St. Albans, staged a small group, comprising *Cypripediums*, *Odontoglossums*, and *Cattleya Gaskelliana alba*, the latter a delightful white form.

CERTIFICATES AND AWARDS.

Cattleya Rex (Welbore S. Ellis).—The specimen shown had one spathe carrying three flowers. The petals and sepals are creamy white; the lip yellowish at the base, similarly veined in the throat, other portion rich purplish crimson, heavily fimbriated (first-class certificate).

Cattleya Rex (H. M. Pollett).—This specimen was larger than that exhibited by Mr. Ellis, and carrying four flowers on one spike. The flowers were similar in colour and form to that already described (first-class certificate).

Cypripedium Youngianum superbum (Norman C. Cookson, Esq.).—This is a cross between C. Veitchi and C. laevigatum superbum. The dorsal sepal is nearly white, veined with green and brown. The petals droop, and are covered with rich reddish brown spots, and have a hirsute margin. The lip is large and a bronze green colour (award of merit).

Cattleya Schilleriana Lowiana (Hugh Low & Co.).—The plant exhibited was bearing two flowers; the petals and sepals are green, covered with brown spots; the lip a pale purple streaked with white and a slight tinge of yellow in the throat (first-class certificate).

Cypripedium Bryan, Cookson's var. (N. C. Cookson).—This is a hybrid between C. laevigatum and C. Argus. The dorsal sepal is a greenish white, blotched and veined with brown, the petals being covered with heavy chocolate spots and having a hirsute margin. The lip bronze-green and veined with a brighter colour (award of merit).

Nemisia Strumosa Suttoni (Sutton & Sons).—An exceedingly pretty annual with flowers of various colours, from nearly white to a rich crimson, borne in clusters (first-class certificate.)

Aster diplostaphioides (W. Marshall).—A charming hardy Aster with large flowers. A full description will be found on page 79 of this issue (first-class certificate).

Carnation Oriflam (J. Douglas).—A beautiful variety with bright scarlet flowers. It is evidently a strong grower, free bloomer, and altogether an excellent sort (award of merit).

Carnation Marnie Murray (Martin Smith).—A grand variety with full flowers, brick red in colour (award of merit).

Carnation Miss Constance Graham (Martin Smith).—A crimson flaked variety of considerable value (award of merit).

Carnation The Pasha (Martin Smith).—A beautiful salmon pink variety, the blooms being large and very double.

Carnation Mrs. Harris (Martin Smith).—A charming flaked variety, large blooms (award of merit).

Carnation Horace Skimpole (Martin Smith).—A strong grower with salmon coloured flowers (award of merit).

Begonia Meteor (Sutton & Sons).—A dwarf growing variety eminently adapted for bedding. The flowers are single, salmon colour, and erect. The leaves are small, dark bronze veined with green, under side a reddish shade (award of merit).

Gloxinia Her Majesty (Sutton & Sons).—A pure white variety, already described in these pages (award of merit).

Begonia Princess May (T. S. Ware).—A double variety, with white flowers and creamy centre (award of merit).

Begonia Baronne de St. Didies (T. S. Ware).—A beautiful double pale yellow variety (award of merit).

Crocus aurea imperialis (W. Marshall).—An attractive plant, with small orange yellow flowers borne on slender spikes (award of merit).

Sweet Pea Lord Beaconsfield (H. Eckford).—A light coloured variety tinged with pink (award of merit).

SCIENTIFIC COMMITTEE.—JULY 12TH.—Present: Dr. M. T. Masters (in the chair), the Rev. W. Wilks, Dr. Müller, Prof. Church, and Rev. G. Henslow, Hon. Sec.; visitors—Prof. Emory Smith of the Leland Stanford Jr. University, California, and Dr. Kränzlin of Berlin.

Termes at La Rochelle.—The Secretary read a letter received from Mr. Warburton, giving further details of the injuries done by *Termes lucifugus* at La Rochelle. He believes it to have been imported from S. America. He says, "It cannot now be got rid of, as it has spread too widely—not only at Rochelle, but at Rochefort, up the river Charente, and at Saintes. I am not certain as to what plants it has attacked, but *Pelargoniums* and *Dahlias* are among them. It has destroyed Vines, and any other plants it has come across, such as fruit trees and most flowers. It lives in wood principally, consequently it does damage to plants only in or near houses. As the ants can only move underground in subterranean galleries, I do not think they could do much harm in open fields, where the galleries would always be destroyed by tillage operations. The *Termes* only spreads in two ways, as far as I can ascertain—namely, by the wood in which it exists being carried to other places, and by eating its way from one house to the next. This last process is a very slow one. I do not think that the *Termes* exists in any other part of France than that part of the Charente Inférieure, extending from the entrance of the river Charente to some distance up its course, so far, in fact, as the cargoes of wood from S. America used to be carried up in ships in the last century; and at La Rochelle and Saintes, which were both great places for this import in olden times."

Tomato and Sulphate of Copper.—As another instance of the possibly injurious effects of this substance Dr. Masters mentioned that M. Cornu found that its application, though given in the prescribed quantity, proved fatal to the foliage of the Tomato. Prof. E. Smith was asked if Tomatoes and Potatoes suffered in California as here, with the same fungus, *Phytophthora infestans*. He replied that though Tomatoes are grown in 100 acre tracts there is no disease to which they are subject, though Potatoes are, if not to the same or at least to an allied form of fungus.

Calochilus.—Mr. Ware sent a spray of this Australian Orchid. It has an erect oscillating and fringed lip, the column being declinate, and the whole flower a delicate mauve colour. Dr. Kränzlin observed that it is very difficult to cultivate, as the natural conditions of its native habitat cannot easily be supplied.

Pinus sylvestris Injured.—Dr. Masters showed a drawing of a bough of this tree which he had observed at Boscombe. It had apparently been split longitudinally into three pieces. They, however, were reunited beyond the spaces injured. No cause could be assigned for the remarkable occurrence.

Dianthus Attacked by Fungus.—Rev. W. Dod sent some specimens of different species attacked with fungi. They were sent to Kew for examination and report.

Æcidium on Paris quadrifolia.—Mr. Plowright forwarded specimens with the following communication:—"During the present summer Mr. W. Thompson of Carlisle and I have been engaged in working out the life history of this *Æcidium*. The details of our work we hope shortly to publish. In the meantime it seems desirable to state briefly that we find the *Æcidium* on *Paris quadrifolia*, which occurs near Carlisle, is connected with a *Puccinia* allied to *P. sessilis*, *P. digraphidis*, and *P. Phalaridis*, which species, it will be remembered, have their *æcidiospores* on *Allium ursinum*, *Convallaria majalis*, and *Arum maculatum* respectively. The Carlisle *Puccinia* was found by us to germinate

freely from the end of April till the middle of May. Applied to the above named host plants it produced no result, but succeeded upon *Paris quadrifolia*, on which plant it gave rise to *Spermogonia* followed by *Æcidia*. The resulting *æcidiospores* were applied on June 10th to the foliage of *Phalaris arundinacea*, which in twenty days bore a *Uredo* with dark orange or reddish brown spores. Further details of our culture will be published shortly."

Cronartium ribicola.—He also sent specimens of this fungus, observing that they were gathered on July 3rd in the garden of Mr. C. J. Boyes, Oakwood House, Setch, near King's Lynn. "For several years past I have been looking out for this fungus, but until the above-named day without success. It occurred on Black, White, and Red Currant bushes in both stages—viz, *Uredo* and *Telento* spores. The parasite was found sparingly in two gardens adjoining Oakwood House. Several Pines of various species are growing in these gardens, but the season is too advanced for the *Peridermium* to be encountered in its perfect stage." Dr. Masters observed that this disease on *Pinus Strobus* has been known for several years, but it is only now that the fungus has been traced to its source on Currant bushes by Mr. Plowright.

Daisy, Monstrous.—Dr. Masters showed drawings of a very unusual form of flower, in which the ray florets had cohered into a campanulate cup, the styles and stigmas uniting into a column. A detailed examination with figures will shortly be published.

Tsuga Pattoniana and *T. Hookeriana*.—He also showed branches of these trees, pointing out the differences, though regarded as the same species. Prof. E. Smith remarked upon the great differences which obtain between the maritime horizontal form of *Cupressus macrocarpa* and the erect fastigate inland variety. Mr. Henslow alluded to the fact that the *Deodar*, so different from the Cedar of Lebanon in habit in this country, resembles it in its native home on the Himalayas.

Curnations Attacked by Hylemyia Grubs.—In response to the request for observations made by the Scientific Committee, "W. D." writes as follows to the *Journal of Horticulture*, July 14th, page 33:—"The earliest stage of the operations of the grub is to be seen about the early part of June, and any symptoms of decay in the main or lateral stems of the plant should be examined, when a very small yellow grub will be found, changing to a nut-brown colour as it gets older, eating out the heart of the stem, but it cannot be seen until the attacked part is cut away and examined. It also attacks the young foliage and eats its way into the 'grass' (young leaf-shoots at the base of the plants), and any indication of curling or decay should lead to immediate examination. The grub ultimately turns to a small brown chrysalis about a quarter of an inch long. The only remedy is frequently and closely searching, examining, and hand-picking."

University Horticultural Education.—Professor Emory E. Smith gave an interesting account of the new Horticultural Department of the Leland Stanford Jr. University of California. He stated that this great University, which opened the 1st of last October, was located about thirty miles from San Francisco, in the heart of one of the largest fruit districts in the world; and had a first endowment of over £4,000,000. The endowment being ample, no fees are necessary, the education being practically free, students only having to arrange for board, books, and clothes. Belonging to the University there are about 40,000 acres of rich land, about 1100 of which are already in bearing as vineyards, a considerable tract being orchard land. Immediately surrounding the University buildings there are 8000 acres of rich land. Upon this is already located one of the finest stock-breeding farms in America. Something like 1000 acres of this tract will be planted as orchard, and about 100 acres will be used for illustrative horticultural work of various kinds; 250 acres will be devoted to landscape gardening, and about 100 acres to botanical purposes. This is the first University in the world to elevate horticultural education to its true place of dignity among the arts and sciences, by making it one of the leading features of the Institution. It will be noted that in this case horticulture has been severed from agriculture, and has been made entirely independent of other departments. Regular students from any part of the world of sixteen years of age or over can enter the University by passing a satisfactory examination. There is also a provision for the entry of special students of any age or degree of proficiency, without any fee or examination, but simply upon the recommendation of the professor in charge of the department in which he desires to work.

The one idea held in view by the Department of Horticulture is to harmonise and teach simultaneously the practice and theory of horticulture, and to make the subject so attractive that many will seek this class of education, and follow horticultural industries rather than those which at present are made educationally more alluring; so that the brighter youths of the rural district who now flock to the cities will rather be drawn towards rural pursuits than city professions. It is hoped, by thus aiming at the highest possible horticultural education, to elevate horticulture into a recognised position of equality with the most dignified arts and sciences. Degrees will be given in horticulture of equivalent value to those in other departments of the University, when the students have acquired the necessary proficiency. The first degree can be obtained by students in horticulture after four years' satisfactory work. After this three years of independent work are provided, giving the student every opportunity to make original investigations and conduct experiments, as well as follow out any line of practical work; thereby enabling him to earn still higher degrees. As an illustration of what we hope to do, a class will plant say 50 acres in orchard, and the students before acquiring their first degree, will not only have budded

and grafted the trees, but will have pruned and brought them into bearing, packed the fruit and shipped it, and kept accurate accounts of their operations.

Of course, at the same time that students are carrying on their practical work in the field, regarding which they have no discretion outside the directions of the professor in charge, they will be conducting their scientific studies, such as entomology, botany, geology, ornithology, zoology, agricultural chemistry, &c. The chief branches of the department (any special one of which students may follow out as a specialty for the three years after obtaining their first degree, and all of which have to be taken in the general course) are fruit culture, fruit preservation, vegetable growing, floriculture, and landscape gardening. One feature of this system of education is that each student must at some period previous to taking his first degree, work for several weeks in one of the best nurseries, canneries, greenhouse establishments, &c., in the country, under the direction of the regular superintendents of the several establishments. This enables the student upon taking his first degree to decide which industry he may prefer to make the chief object of his three years' independent work and study. For the constant aim will be to teach the commercial aspect of every problem as thoroughly as the scientific and operative sides.

Special students who do not pass examinations will have every advantage in the class work; and while they cannot secure degrees they can earn certificates of proficiency, stating the length of time they have worked in the department, and the degree of excellence attained. We are inclined to inaugurate a system of examination quite different from that usually in vogue. The student will be required each day, or at frequent intervals throughout the terms, to give the day following the performance of certain practical or scientific operations both a written and verbal account of the work accomplished. The excellence of these reports, and the general standing of the students in their classes throughout the year, will rather determine their fitness for acquiring degrees than the old-fashioned final examination. At present there are about 520 students at the University, and in October next there will be about 1300; but in following years, when more buildings have been erected, the number will probably be more than doubled. A number of these students are entering, or preparing to enter, the horticultural department. It will be understood that the examinations in this University, and the mental attainments required of the student, are on a par with those of Oxford, in England, and it will thus be seen that a bid is made for students of first-class ability. A large number of the first horticultural authorities in America have been consulted regarding the formation of this department of horticulture, and general satisfaction was expressed at the plans under which the work is and will be carried on. The students' expenses at the University need not exceed £5 per month, the charge for board and room being £4 per month, the actual cost to the University. Students who are industriously inclined can frequently work their way, and scholarships will be offered to those showing great progress in their studies.

This, it will be understood, is a very brief and general outline of the great work in hand, as it would take too long to develop the ideas and plans in detail.

An unanimous vote of thanks was given to Professor Smith by the members of the Scientific Committee for his most interesting account.

EVENTS OF THE WEEK.—Shows continue to be plentiful. To-day (Thursday, July 28th) there are Exhibitions at Halifax, Southwell, and Salterhebble (Yorks). On Saturday, July 30th, Ripley and Southampton Exhibitions open, the latter continuing the following Monday. A three-days special Show of fruit, Carnations, and cottagers' produce opens at the International Horticultural Exhibition, Earl's Court, on Monday, August 1st. On the same day the Beddington and Carshalton Flower Show and Fête is held, and there will also be a Show at Mansfield that day. A Show and Gala will be held at Abbey Park, Leicester, on Tuesday, August 2nd. Messrs. Protheroe & Morris's customary sale of Orchids takes place at their rooms in Cheapside on Friday.

— **THE WEATHER.**—The weather in the metropolis has been of a varied character during the past few days, but generally fine. Warm and cool days have alternated, but the nights have been generally cold, in consequence of prevailing easterly winds. We hear that the Potato disease has made its appearance, but not in a virulent form.

— **GARDENING APPOINTMENT.**—Mr. Preston Altoft of Brocklesby Park Gardens, Lincolnshire, has been appointed gardener to the Dowager Countess of Yarborough, Healing Manor, near Uleby, Lincolnshire.

— **DEATH OF MR. JOSEPH ELLAM.**—We learn with regret of the death (on the 17th inst.) in his fifty-third year of Mr. Joseph Ellam, best known, perhaps, as the raiser of the valuable Cabbage associated with his name under the designation of Ellam's Early. He was formerly gardener at Cliveden, and at the time of his death was superintendent of the Oxford University Parks.

— **BIRDS ATTACKING BEGONIAS.**—I should be glad to know if it is an unusual thing for birds to attack the buds and half-opened blooms on Tuberous Begonias outside. I have been obliged to protect the plants outside, owing to the buds being pierced and slit by what I feel certain is the birds.—T. F. E.

— **NYMPHÆA CÆRULEA.**—I recently observed this beautiful aquatic flowering in a tub under glass in Dickson's nursery at Chester. Its lovely mauve-blue flowers were charming in the extreme. If procured in a pot, and this plunged over the rim in a shallow tub of water, an unusual and beautiful feature will be added to the greenhouse.—W.

— **LOBELIA ROYAL PURPLE.**—This is one of the most striking Lobelias I have ever seen. In the neighbourhood of Winchester it is largely grown in the numerous villa gardens. If it has a fault it is its somewhat straggling habit, but for ribbon borders or for filling large beds it is very useful, and wherever planted is a striking object. The colour is very rich dark purple, with a large clean white eye. It makes little growth but produces plenty of flowers.—E. M.

— **FORGET-ME-NOTS IN FASHION.**—A Forget-me-not luncheon was given the other day by one of the bridesmaids of a prospective American bride in compliment to the latter on her approaching marriage. Forget-me-nots were arranged in the shape of hearts and true lovers' knots upon the table, and all the decorations were in the colour of the blue flowers. Each guest was provided with a cluster of the blossoms to wear. Forget-me-nots were to be the principal flowers at the wedding, and the bride presented to her bridesmaids pins in the form of the flower in blue enamel with a diamond dewdrop glistening in the centre.

— **STRAWBERRY CARDINAL.**—You recently gave me permission to allude to my experience of about twenty varieties, and in the hurry of writing this escaped my notice. Mr. Paxton sets it down as "second early," but with me there was only a few days between it and Noble, and just three days behind Scarlet Queen in the same bed; while the flavour I like immensely. It is much superior to Competitor, but the yield in weight would be about half. In fact, Competitor on a warm limestone soil with me had the largest and finest berries. Cardinal will supplant two excellent varieties under other circumstances—Sir Joseph Paxton and British Queen—with me.—W. J. MURPHY, Clonmel.

— **WALLFLOWERS FOR SPRING BEDDING.**—No time should be lost in pricking these out from the seed bed during showery weather. Allowing them to remain in the seed bed until they are drawn up weakly is not the best way to prepare the plants to withstand such winters as the last two, nor to secure a good display of bloom. Properly prepared Wallflowers should have numerous side shoots, commencing close to the soil, from each of which a stout flower spike can be expected. It is not so with those ill-grown plants which run up with one stem and exhibit no sign of side branches. If pricked out into rows 10 inches apart and 8 inches asunder ample space is afforded for running the hoe between the lines occasionally to keep the soil stirred about the plants.—E. M.

— **BOURNEMOUTH GARDENERS' IMPROVEMENT ASSOCIATION.**—The fourth annual excursion of the members took place on Wednesday, July 20th, to Broadlands Park, Romsey, the seat of the Right Hon. E. Ashley. The party, over fifty in number, journeyed by rail to Romsey, where they were met by Mr. Fowler, the head gardener, who welcomed them most heartily, and conducted them to the park. The park is a most extensive one, and contains some fine groups of trees, amongst them being some noble Cedrus deodara, C. atlantica, and C. Libani, many of which were planted by the late Lord Palmerston between seventy and eighty years ago. There are also other enormous specimens, said to be 230 years old. In the grounds also was a very fine specimen of the Maidenhair Tree. The party were next conducted through the extensive kitchen gardens, also the vineries, Peach houses, and plant houses, the whole of which reflected the greatest credit on Mr. Fowler and his assistants. Luncheon and tea were partaken of in the large Orange house, and after tea a visit was paid to the famed Romsey Abbey.

— *ARDISIA CRENULATA*.—This is a good plant for winter use; shapely and well berried plants are sold in very large quantities, especially around the holidays. It has the advantage, too, of staying in condition for a long time; it is no uncommon thing for a second crop of berries to be maturing before the first is off the plant. Well-clothed plants in 4 to 6-inch pots are the favourite size.—(*American Florist*.)

— **BANK HOLIDAY AND THE GARDENERS' ORPHAN FUND.**—The Committee of the Beddington, Carshalton, and Wallington Horticultural Society have made arrangements to have a Flower Stall for the sale of cut flowers, fruit, &c., in connection with the annual Flower Show and Fête, to be held in Carshalton Park on August Bank Holiday. The proceeds will be devoted to the above Fund. If the day is fine a great gathering is expected, and ample provisions are made for amusement and instruction. In the horticultural section a conference will be held under the auspices of the Surrey County Council, and addresses delivered by Mr. Alexander Dean and Mr. Edward Luckhurst, also by Mr. G. Gordon and Mr. J. Wright, the Judges. Carshalton is in the centre of a populous district, and can be reached in half an hour from London. Mr. G. W. Cummins, The Grange Gardens, Wallington, is the Honorary Secretary of the Society.

— *ASTER DIPLOSTEPHIOIDES*.—Without fear of contradiction this may be said to be the finest herbaceous Aster at present known. Although somewhat scarce it is by no means a new plant, being described in De Candolle's "Prodromus" for 1836 as *Heterochaeta diplostephioides*, and figured later in the "Bot. Mag.," 109, t. 6718. The flowers are about 3 inches in diameter, borne singly on simple stems 15 to 18 inches high. There are usually two series of ray florets. The ligules, over an inch long, are a pretty bluish purple; the unexpanded disk florets are deep purple, and the outer expanded ones showing their anthers, form a deep yellowish ring, making it altogether a lovely flower. Plants have been raised at Kew from seed sent from Sikkim, and a plant now flowering in the Royal Horticultural Society's Garden at Chiswick was received from the Royal Gardens. The light soil at Kew and Chiswick seems to suit this Aster very well. The Floral Committee when visiting Chiswick lately awarded *A. diplostephioides* a first-class certificate.—**QRIOS.**

— "**PARAGUAYAN TEA.**"—As the authorities of Kew have established a very popular Tea house, near the Chinese pagoda, in their beautiful gardens, there seems no reason why they should not introduce "Paraguayan Tea" to the notice of the British Tea drinker. In the new number of the "Kew Bulletin" there are some interesting particulars of this important shrub, which is extensively used by the entire population of South America. Strictly speaking it is not a Tea plant, but a species of the Paraguayan Ilex; but the active principle in its leaves is caffeine, identical with that which is found in Tea and Coffee. Though closely allied with Coffee, it is stated to be slower in yielding up its principles to boiling water. In preparing it the leaves are scorched and dried while still attached to the branches brought in by the collectors. They are then beaten, separated, coarsely ground by rude mills, and packed in skins and leather bags. The leaves are infused in small teapots, and the Tea is sucked with a bombilla or tube with wire network or perforations at the bottom. Specimens of the shrub have long been in cultivation at Kew.

— **TECHNICAL EDUCATION IN HORTICULTURE.**—During the afternoon of the 20th inst., at the Caterham Flower Show, a very interesting function was discharged by Mr. Halsey, J.P., Chairman of the Technical Education Committee of the Surrey County Council. Mr. Halsey having been invited to address a meeting of exhibitors and others in the Show tent. The particular duty which gave him real pleasure was the presentation of the medals awarded by the Royal Horticultural Society in connection with a recent examination on the subjects of the horticultural lectures delivered under the management of Mr. J. Wright, of the *Journal of Horticulture*, in the county, and which examination was conducted by the Royal Horticultural Society. These medals were awarded to Mr. Morrell, of Carshalton, who received the largest number of marks in one grade, and Mr. Walter Smith, of Henley, who occupied the highest position in the other grade. Both these gentlemen are elementary school teachers, and exhibited in their papers very advanced knowledge in horticulture. Some disappointment was shown that the medals were only of bronze, as certainly very much more valuable ones were looked for. However, the honours remain to these gentlemen, even though the rewards were so comparatively inefficient.—**A. D.**

— *ARISTOLÓCHIA GIGAS*, *Lind.*—W. B. Latham, Curator, Botanical Gardens, Edgbaston, Birmingham, writes:—"This, one of the most marvellous flowers of the vegetable world, is now flowering here. I have just taken the measurement of a flower which may be interesting to the readers of the *Journal of Horticulture*. It is as follows:—Flowers 14 inches across (in position), 19 inches long, tail to flower 37½ inches, entire length of flower from perfoliated bract at the end of the germen to the end of tail 60 inches. The flower is drooping, bent back like a syphon, and has been likened to a pelican, the resemblance being seen to advantage in a bud state. The centre of the flower is a black purple with prominent veins radiating to the margin, mottled throughout with purple on a white ground. We are indebted to the authorities of the Royal Gardens, Kew, for the reintroduction of this remarkable plant after being lost to cultivation many years, and also for presenting a specimen to this Society, and by so doing giving the people of the Midlands an opportunity of seeing this wonderful West Indian plant."

— *LOBELIA MAID OF MORAY.*—On page 30 of your issue for July 14th your correspondent, Mr. Molyneux, draws attention to the beautiful dwarf bedding Lobelia above named, which he calls a striking novelty. Striking it undoubtedly is, but a novelty it can hardly be correctly called. It was sent out last year under this name by a leading firm of Edinburgh nurserymen, and being a great admirer of this family I sent for a dozen plants, but when they bloomed I at once said that it was identical with what was sent out many years previously by the well known German firm of Pfitzer of Stuttgart, under the name of *Swabische Mädchen* or *Suabian Maiden*. Its habit is all that your correspondent says, and if it were but a little more free blooming it would be quite an acquisition. Messrs. Cannell, of Swanley, sent me last year under the name of *Picotée* another Lobelia of exactly similar habit of growth and with flowers of a rather lighter hue, which forms a very pretty companion to the *Maid of Moray* or *Suabian Maiden*. I am also much pleased with another beautifully compact and dwarf growing Lobelia named *Little Dot* sent out this year by Mr. W. B. Hartland of Cork, which is a much freer bloomer than either of the above named varieties, and promises to be a great acquisition. Its flowers are a rich deep shade of blue.—**BOSCOBEL.**

— **BAMBOOS AT KEW.**—We gather from the "Kew Bulletin" that owing to the collection of hardy Bamboos and allied plants having outgrown the space allotted them in the beds near the temperate house, a new garden has been made for them in the wood near the *Rhododendron dell*. This garden is in the form of a shallow depression with sloping banks 12 feet wide and a central pear-shaped bed 125 feet by 75 feet. To make it, the surface soil had to be removed and the gravel taken out to a depth of about 3 feet. A large quantity of new soil and manure was added, so that the Bamboos have now a good depth of rich soil. Two new paths leading to the Bamboo garden have been made, one from the Syon vista and the other from the Stafford walk. The Bamboos planted in the gardens are:—*Arundinaria Fortunei* (*Bambusa Fortunei*), *A. japonica* (*Bambusa Metake*), *Bambusa albo-striata*, *B. gracilis*, *B. nana* (Hort), *B. palmata*, *B. plicata*, *B. pumila*, *B. tessellata*, *B. Veitchi*, *Phyllostachys bambusoides*, *P. nigra*, *P. Quilloi* (*Bambusa Quilloi*), *P. violescens* (*Bambusa violescens*), *P. viridi-glaucescens* (*Bambusa viridi-glaucescens*), *Thamnocalamus Falconeri* (*Bambusa Falconeri*), and several others unnamed. Besides Bamboos it contains such plants as *Arundo*, *Eulalia*, *Crinum*, *Funkia*, *Yucca*, &c. It is also intended to bring together in this garden a number of the coarser growing monocotyledonous plants which can be grown in the open air at Kew.

— **ELLAM'S EARLY CABBAGE.**—Through the announcement of the death of Mr. J. Ellam, formerly head gardener at Cliveden, which took place at Oxford on the 17th inst., we are reminded that, far more fortunate than many other horticulturists, Mr. Ellam has left behind a memorial the which will presumably long endure, in the small early Cabbage which bears his name. It is unusual good fortune for the raiser of any good thing thus to have his name so closely identified with it as is the name of Ellam with this Cabbage. How many distinguished horticulturists have raised fine products of which the reputation of the product only lives, whilst that of the originator has been lost absolutely? How many a good gardener has had his name associated with some florist's flower, but which, being popular for a year or two, has soon been buried in oblivion? Such is fame when allied to floriculture. Mr. Ellam was more fortunate. His name will long be borne in pleasant remembrance because it is associated with such an excellent vegetable as is this early Cabbage, and which

will be long literally and figuratively in our mouths. How interesting would it have been to learn exactly how this Cabbage originated. In any case, it seems to have been closely allied to that excellent variety Little Pixie, and equally has some apparent connection with the famous Hardy Green Colewort, so good and precocious is it. We now universally advise its culture for all sorts of seasons, not only because it is so precocious, but also because so good, and it may be grown so close together, not robbing the soil in the same way that gross Cabbages do with but

FIG. 11.—SARRACENIA FLAVA.

indifferent returns. Then small Cabbages are always less wasteful, sweeter, tenderer, and in every respect more satisfactory than are big ones. Therefore we retain Mr. Ellam and his Cabbage green in our memories.—A. D.

— COLDER SEASONS AND VEGETATION.—In reference to the recent publication in the Journal of some observations by Mons. Flammarion on this subject, Mr. W. Thomson of Clovenfords writes to a northern contemporary as follows—"From whatever cause this general depreciation of the climate of Europe arises, it is a circumstance which can scarcely be disputed that, for the time being, the climate, for all cultural purposes, is not what it was fifty years ago. Then we had

exceptionally bad seasons, as, for instance, 1836, and others since then not quite so bad. The bad were the exception then, the good are the exception now, which makes a very material difference. Cold winters are very trying, but they do not inflict the injury on the country that cold summers do. While I write, on July 12th, the thermometer is standing at 52°, and was as low as 47° at six o'clock this morning. At the same time, vegetation cannot be said to be hopelessly backward, thanks to the rain and very warm weeks we had in June. Turnips and Potatoes are not making the progress they should do at this season, in consequence of the absence of the steady, genial heat that used to be a characteristic of July weather. There can be no doubt that the absence of summer warmth is lowering the value of land in Britain, and Europe generally. I have it on the authority of some of the most able and observant farmers I know that, with increased agricultural skill, greatly improved implements, and an enormous increase in the application of artificial manures, not to speak of foreign feeding stuffs, they cannot on the same farm produce anything like the crops they did forty years ago, or keep the same stocks of sheep and cattle. If this deterioration of the climate is taking place, which seems evident, it is specially a serious matter for Scotland, where the margin of heat that can be spared is a small one."

SARRACENIAS.

(Concluded from page 27.)

IN 1881 Dr. Masters published in the *Gardeners' Chronicle* an excellent monograph of Sarracenias, which included all the kinds of garden origin in addition to the species and varieties known at that time. Writing of *S. flava*, he stated that as well as being the tallest species in cultivation it is also the most variable, some of the so-called varieties being so widely different from the type that it is questionable if they ought not to rank as distinct species. In the accompanying figures we have represented the typical *S. flava* and an extreme variety called *maxima*, which support this view. *S. flava* (fig. 11) has pitchers about 3 feet in length, narrow all the way up, with a half-opened lid, and coloured bright green, tinged when mature with yellow about the mouth. When weakened by improper treatment its pitchers are not developed, but are all "wing," not unlike the blade of a knife. The plant obtains its name from the colour of its flowers, which are bright yellow. The disc-like stigma is 2 inches across. *S. flava* is not included among the best as a Pitcher Plant, but it is well worth a place in any greenhouse collection on account of its handsome, freely produced flowers.

The variety *maxima* (fig. 12) is of garden origin, or at any rate it is only known from cultivated specimens. It is almost as fine as the variety *ornatus*, the pitchers being wide-mouthed with a large lid and coloured bright green, tinged about the mouth with yellow and slightly veined with crimson. The other good varieties of *S. flava* are *picta*, with very large wide-mouthed pitchers, greenish yellow, richly veined with purple; *ornata*, whose enormous canary yellow flowers are as beautiful as Emperor Daffodils, and of which the handsome pitchers are unsurpassed; *erythropus*, *limbata*, *crispata*, and *atrosanguinea*. There is a variety, found by the collector Drummond in New Orleans, which has long pitchers "stained with purple for nearly their whole length." I have never seen this plant, but from the description it is well worth the attention of collectors.

The allied genus *Darlingtonia*, a native of California, is similar to the Sarracenias in its habit of producing pitcher-like leaves, and it requires the same kind of treatment, plus a warmer position in the greenhouse, at all times. I am told that the finest examples, with pitchers 3 feet high, were grown in a moist shaded warm greenhouse. There is only one species—viz., *D. californica*. Several attempts have been made to cross this with the Sarracenias, and one, I have recently learnt, has been crowned with success. A plant combining the highly remarkable characters of these two genera cannot but be of the highest interest to botanists as well as horticulturists. *Darlingtonia* produces seeds freely under cultivation, and it is also easily multiplied by means of offsets. Its flowers are not ornamental, but the pitchers of well managed plants are decidedly so, both in variegation and in form, the latter being not unlike the raised head of a cobra about to strike, a similarity which has led to its being called the Cobra Plant.

The only other ally of Sarracenia is *Heliamphora nutans*, a native of the Roraima Mountain in British Guiana, where it was first discovered by the late Sir R. Schomburgk, and whence it was introduced a few years ago by Messrs. J. Veitch & Sons. Last year also some imported plants were sold by Messrs. Protheroe and Morris, I believe for Messrs. Charlesworth, Shuttleworth & Co. Some of the latter have been established in several London nurseries, and we may therefore hope eventually to see the

Heliamphora in general cultivation. It has rather fleshy upright pitchers, with a very small lid, much smaller than the mouth of the pitcher. The flower is not so specialised in structure as in *Sarracenia* and *Darlingtonia*, but is more like that of the *Ranunculus*, to which really these *Sarraceniaceæ* are closely allied. *Heliamphora* was flowered by Messrs. Veitch a year or two ago, and a figure of it was soon afterwards published in the "Botanical Magazine."—W. W.

HORTICULTURAL SHOWS.

BIRMINGHAM.—JULY 19TH.

WE last week gave a brief notice of this Exhibition, and now give a few further details. The downpour of rain all the first day was followed by a violent gale in the evening and throughout the night, one tent collapsing altogether, but no great harm was done. But for the vigilance of the men told off to watch the tents all night the great tent, 230 feet long, would have shared the same fate. The second day was a fine one, and a very large number of visitors attended.

The Roses we have already alluded to, but there were two boxes of the older sorts of garden Roses, sent by Messrs. Cooling & Sons, Bath, to which a silver medal was awarded. The centre of the long tent was devoted to some beautiful groups of plants. At the entrance Messrs. Thomson & Co. had arranged a lovely bit of artistic work in Ferns, climbing Asparagus, and other plants, with rockwork and a miniature pool containing Water Lilies. Then followed the three larger groups, for the prizes of £10, £8, and £6, Mr. W. H. Dyer, gardener to Mrs. Marigold, Edgbaston, taking the first prize with a beautiful well-arranged group, in which well coloured small Crotons were seen to great advantage. Mr. Earp, The Gardens, Highbury, was second with a good sprinkling of Orchids in the group, but a flatness in the arrangement told against it. Third, Mr. F. Denning. A class for smaller circular groups, 10 feet in diameter, brought out four good exhibits, Mr. Dyer again taking the first prize with an equally well set up group, and also a special prize for ornamental plants and some specimen stove and greenhouse plants in flower, including a grand *Kalosanthes*, 3 feet through.

Messrs. Hewitt & Co., The Nurseries, Solihull, had a large group of well-flowered Pelargoniums and a large display of cut herbaceous, Carnation, Begonia, and other blooms. Messrs. Thomson & Co. also contributed a large display of cut flowers and plants. Messrs. Cannell and Sons, Swanley, had a greatly admired display of double Begonias, tastefully arranged in sprays of three blooms each. The Rev. Mr. Lascelles, Rosebud, Hon. Mrs. Goschen, and other varieties were especially fine. Miss Falkner is a lovely deep bright yellow. Next to these were a display by newer sorts of Sweet Peas in bunches from Mr. Henry Eckford of Wem, and these also were greatly admired. Lottie Eckford, although not a new variety, is a lovely and distinct one, white margined with pale blue; Royal Robe, faint blush pink, very lovely; Majestica, lighter in colour than Royal Robe, blush with pale rose margin; Venus, pale rose tinted salmon; Blanche Burpee, a very fine white; Mikado, light rose flushed with white; H. M. Stanley, very dark; Firefly, deep bright crimson, very fine; Emily Eckford, a distinct pale blue lilac self colour, and with more of a blue colour in it than any other; Lady Penzance, bright orange tinted pink and very lovely, were very fine. Messrs. Hewitt & Co. staged several plants of a dwarf close-habited decorative Pelargonium, A. F. Barron, a most useful sort. Mr. Jannoch, Dersingham, had a lovely display of Lily of the Valley blooms, rather a novelty in July, to which a silver medal was awarded; also his new Fern *Adiantum Capillus-Veneris* var. *grandc.* Mr. W. H. Gabb, Small Heath, contributed Fancy Pansies and Violas.

The Moseley Botanical Gardens will evidently be a home in future for flower shows, as Mr. Ross, the proprietor, is in a position to offer good prizes. Another Exhibition is fixed for the end of August, when good prizes will be offered for collections of Dahlias as well as for classes of Dahlias.

CATERHAM.—JULY 20TH.

THIS Exhibition was held in a park-like field near the railway station, and in the Caterham valley the morning was an exceedingly cold and wild one, and the wind came down from the adjoining hills in tremendous gusts, at times almost tearing down the fine tent, which happily withstood the forces of bold Boreas, though at times tremblingly. There were, as is usual, some few honorary groups of plants staged, notably one from Messrs. J. Laing & Son, Forest Hill; also from Messrs. J. Peed & Son, Lower Norwood; from Messrs. Butcher & Sons, Norwood, and from Mr. G. T. Sedgely, a local florist. Of the ordinary decorative groups the best was arranged by Mr. Lane, gardener to E. H. Colcs, Esq. A plant of the old *Trachelium cœruleum* was a prominent feature in it; also there were some good Begonias, *Dracænas*, Crotons, &c. The second prize went to Mr. Palmer, gardener to Percy Clarke, Esq., and the third to Mr. Papworth, gardener to J. Lyon, Esq. Owing to the exceedingly elevated centre staging it was practically impossible in some cases to see or reach the prize cards. The best foliage specimen was a good *Maranta zebrina*, and a fine single scarlet Begonia, an unusually good specimen, was the best flowering plant. Mr. Harris, gardener to R. H. Salmon, Esq., had the best three Ferns. Three fine double-flowered Zonal Pelargoniums won the first prize in that class for Mr. Jones, gardener to J. Newberry, Esq. Mr. Brand, gardener to G. W. Warren, Esq., had the best six Begonias in bloom; whilst Mr. Palmer came first with three nice pots of *Achimenes*. Well bloomed *Gloxinias* were very good. Mr. Brand had the best six. One of his

plants had a wonderful mass of fine erect flowers, fully 16 to 20 inches over, and was one of the best plants we have seen.

Dinner-table decorations were creditable, the best being shown by

FIG. 12.—SARRACENIA FLAVA VAR. MAXIMA

Mrs. W. Soper, consisting of five glass stands of single stems filled with pink Sweet Peas, Grasses, and Ferns, and having at the corners tiny Ferns tied with pink ribbons, standing in little wicker baskets. Miss Soper, who was placed second, having stands dressed with scarlet field and Iceland Poppies, Asparagus, and Grasses. Mr. Myatt, gardener to J. Perry, Esq., had the best box of cut flowers, *Allamandas*, *Eucharis amazonica*, *Amaryllis*, *Kalosanthes*, *Gloxinias*, and *Passifloras*. Mr.

C. Roberts, gardener to C. Asprey, Esq., was first with four dishes of fruit, comprising very good Black Hamburg Grapes, Melons, Raspberries, and Cherries. Mr. Pearman, gardener to H. Horne, Esq., was second, having also fair Grapes, Melons, and other fruit. Mr. Roberts had the best two bunches of Grapes in finely finished Hamburgs, Mr. Harris coming second with Muscat of Alexandria. Mr. Roberts had the best dish of Tomatoes in a superb lot of Perfection, and Mr. Myatt was second, and also first in another class with the same variety. Mr. Palmer was first with six vegetables, having pretty white Kidney Potatoes, Carrots, Cauliflowers, Marrows, Peas, and Turnips. The same exhibitor had the best nine dishes in a special class with excellent quality. The exhibits in the cottagers' classes were not numerous, but vegetables were very good. In the evening Mr. A. Dean of Kingston, who with Mr. J. Hudson of Gunnersbury, acted as one of the Judges, gave under the auspices of the Surrey County Council an address on Cottage and Allotment Gardening under very disadvantageous conditions, no preparations whatever having been made for the meeting.

LIVERPOOL.—JULY 20TH AND 21ST.

ON Wednesday and Thursday last the thirteenth annual Show of the Liverpool Horticultural Association was held on the review ground, Sefton Park. Tuesday was a day to be remembered, pouring rain and a gale of wind lasting throughout the day and night. Many who had brought their plants in readiness for the morrow, fearing the safety of the tent, preferred to leave them in the vans, and perhaps it was just as well, for a portion of the tent was blown down, but fortunately without damage; and what a change on Wednesday! a calm morning with warm sunshine, and never has there been a more fashionable attendance on a first day at any previous Show. On the second day the attendance was very good. Of the Show itself, considering the adverse season the exhibits may be classed as uniformly good. Roses which were to have been a special feature were greatly at a discount owing to the terrible storm of Tuesday, and exhibitors reserving their forces for the Manchester and Ulverston Rose Shows, which were held last Friday.

PLANTS.—In the class for ten stove and greenhouse plants Mr. B. Cromwell, gardener to T. Sutton Timmis, Esq., Cleveley, Allerton, was the only exhibitor, and his plants were excellent. Amongst the best a grand Croton Queen Victoria, which secured the silver medal; Erica Parmenteriana rosea, Allamanda grandiflora, Statice profusa, Ixora Williamsi, and a fine Seaforthia elegans. In the class for six stove and greenhouse plants an exhibitor who has not been seen for some years came out again, Mr. G. Leadbeater, gardener to W. J. Davey, Esq., Holmleigh, Grassendale. His plants were in perfection foliage and flowering, and consisted of Crotons Queen Victoria and Weinmani, Kalosanthes coccinea, Allamanda grandiflora, and Clerodendron Balfourianum (splendid). Mr. Jellicoe, gardener to F. H. Gossage, Esq., Camp Hill, Woolton, was a very good second, having Croton Countess, Anthurium Andreanum, and Allamanda grandiflora, all very fine; Mr. T. Healey, gardener to Col. Wilson, Hillside, Allerton, being third. For three stove and greenhouse plants Mr. Jellicoe first with a good Kalosanthes coccinea, Anthurium Andreanum, and Allamanda nobilis. For single stove and greenhouse plants in bloom Mr. T. Healey and Mr. T. Gowen, gardener to J. A. Bartlett, Esq., Lynton Lodge, Mossley Hill, won respectively with Ixora Williamsi, good; and a finely flowered plant of Hydrangea Thomas Hogg. For four fine-foliaged plants Mr. Cromwell was first, having Anthurium crystallinum and Croton Queen Victoria, excellent. One fine-foliaged Mr. T. Gowen was first with a fine Anthurium crystallinum. The prizes for three Palms and one Palm were taken respectively by Mr. Jellicoe and Mr. J. J. Craven, gardener to J. G. Grant Morris, Esq., Allerton Priory.

Exotic Ferns have never been shown to greater advantage. For six specimens Mr. T. Gowen was first with a fine fresh selection, the best being Davallia Mooreana, 10 feet through; Gymnogramma peruviana argyrophylla; and a splendid plant of Gleichenia dicarpa, 5 feet. Mr. Cromwell was a capital second, having Davallia fijiensis, Gleichenia Mendeli, and Nephrolepis rufescens tripinnatifida, all excellent. In the class for three Mr. G. Eaton, gardener to W. H. Shirley, Esq., Allerton House, Allerton, was an easy first, having fine examples of Davallia Mooreana 8 feet through, Gymnogramma peruviana argyrophylla, and Microlepia hirta cristata. Second, Mr. T. Foster, gardener to J. Brancker, Esq., Greenbank, Wavertree; the latter being first for six hardy and two Filmy Ferns. The prizes for one Tree Fern and one Fern (not Tree) fell to Messrs. Gowen and Jellicoe. For four Lycopods Mr. T. Jones, gardener to W. C. Clark, Orleans House, Sefton Park, secured the prize; whilst the six table plants was taken by Mr. J. Bounds, gardener to A. L. Jones, Oaklands, Aigburth. Orchids were an improvement on last year, the prize for four going to Mr. T. Wilson, gardener to O. H. Williams, Esq., Fulwood Park, Aigburth, for Sobralia macrantha, Vanda suavis, Oncidium crispum grandiflorum, and Lælia purpurata. Mr. C. Osborne, gardener to H. J. Robinson, Esq., Aymestry Court, Woolton, taking second honours. For one Mr. T. Gowen showed a splendid fresh piece of Saccolabium Blumei majus, with ten spikes. Second, Mr. J. Bounds.

Fuchsias, Coleus, Gloxinias, and Caladiums were all shown in good condition by Messrs. Cromwell, T. Moorhouse (gardener to R. Brocklehurst, West Derby), G. Eaton, and T. Carling (gardener to Mrs. Cope, Dove Park, Woolton). There was a divided opinion as to the award for the single Fuchsia, the second prize, shown by Mr. T. Winkworth, being a beautifully flowered standard Earl Beaconsfield, and which was greatly admired. Zonal Pelargoniums were especially fine. For six Mr. Winkworth, gardener to Ralph Brocklebank, jun., Esq., Childwall Hall, was a grand first with perfectly trained and well

flowered plants. A friend of the writer who has exhibited several times at York, said he never saw anything to approach them shown at York. They were the admiration of all. Mr. Winkworth was also first for a single Zonal. The second prize for six plants went to Mr. T. Gowen for excellent examples. Mr. Stoney, gardener to Sir Thomas Earle, Bart., Allerton Towers, staged grand Ivy-leaf Pelargoniums, some 5 feet high, and well flowered, securing the first prize for four, Mr. Winkworth being a very good second. Tuberous Begonias in the six class were not up to the usual standard, the prize going to Mr. J. Agnew, gardener to Mrs. Watts, Aigburth, the same exhibitor winning with a grand pink variety in the single class. Cockscombs were a very strong class, the first prize falling to Mr. W. Lyon, gardener to A. Mackenzie Smith, Esq., Bolton Hey, Roby, for grand samples. Mr. Bounds secured the prize for two Lilliums with auratum and a beautiful example of auratum vittatum rubrum, the second place being taken by Mr. C. Osborne. For one Mr. Osborne had a magnificent auratum with over 100 blooms.

Groups were very fine, the 150 square feet prize being awarded to Mr. Jellicoe for an excellent arrangement. Rising from the centre was a small Phoenix, the pot being clothed with Panicum and Maidenhair Fern, the latter extending to the level of the group. Four smaller pyramids, having Croton interruptus as centre plants, were arranged at intervals. With these the same system of draping had been followed out, the entire groundwork being composed of Maidenhair, and the outside being completed with a band of well coloured Panicum, Gloxinias, Francoas, and pretty plants of Croton interruptus aureus gave the necessary tone of colour to a beautiful group. Mr. J. Bounds was second, the arrangement being very good, but the edging not completed. For 250 square feet, open class, Messrs. Ker & Sons, Aigburth Nursery, arranged a beautiful group. The advantage of the new kinds of Crotons for decorative work sent out lately by Messrs. Ker was evidenced by the judicious way in which they were interspersed throughout the group. The second prize went to Mr. T. Jones, and the third to Mr. T. Coulton, nurseryman, Aigburth.

For four Tomatoes in pots Mr. T. Carling had splendid samples. They were grown four plants in a pot, and literally roped with fruit of fine size and quality. The decision of the Judges in the second prize award was freely commented upon. Mr. Bounds, who received it, had certainly the riper fruit, but the plants were sickly looking, and the fruit far behind in quality that of the third, awarded to Mr. J. Stoney.

ROSES AND CUT FLOWERS.—Only Messrs. Dicksons, Limited, Chester, staged in the forty-eight class for Roses, and a very good stand it was, consisting of the leading varieties. For twenty-four blooms Mr. J. Fell, gardener to A. G. Smith, Earlston Hall, Liscard, was the only exhibitor, the best being Mrs. J. Laing, Pride of Waltham, and Baroness Rothschild. For twelve blooms Mr. J. Lydiatt, gardener to T. Gee, Esq., Greenhill, Allerton, first, the best being La France, Mrs. Laing, and Her Majesty; Mr. C. Carran, gardener to T. Raffles Bulley, Esq., Liscard, being second. Mr. P. Green, gardener to L. H. Macintyre, Greenheys, had the most tastefully arranged box of Roses, Mr. Carran second.

The prize for twelve stove and greenhouse cut flowers was won by Mr. Jellicoe. For twenty-four varieties of hardy herbaceous cut flowers Messrs. Dickson had the finest stand that has been seen at a Liverpool Show. The best flowers were Campanula glomerata, Alstroemeria aurea, Cephalaria antaretica, Spiraea ulmaria flore pleno, and Agrostemma Walkeri. Mr. G. Eaton was a capital second, having Lillium species, Iris of sorts, Alstroemeria aurea, and Galega officinalis, very good. For twelve varieties, Mr. T. Foster first. The prizes for hand bouquets, model garden, Carnations, and Picotees and Dablias were taken by Messrs. Bounds, Carling, Corlett, Lowndes, and Bounds in the order named.

FRUIT although not quite so numerous was fully up to the excellent standard seen at Liverpool. For eight dishes there was only one entry, —viz., Mr. J. Bennett, gardener to the Hon. C. H. Wynn, Rûg, Corwen, N. Wales, and only a formidable opponent could have stood the slightest chance against him. He had splendid examples of Alnwick Seedling and Buckland Sweetwater Grapes, Hero of Lockinge Melon (grand), Royal George Peaches and Violette Hâtive Nectarines, Negro Largo Figs, President Strawberries and a good Queen Pine. For six dishes Mr. T. Elsworthy, gardener to A. R. Gladstone, Esq., Court Hey, Broad Green, came first, having capital dishes throughout, the best being Madresfield Court Grapes, Hero of Lockinge Melon, Bellegarde Peaches and Elruge Nectarines. Mr. Elsworthy came first with the same varieties, being followed in each instance by Mr. R. Pinnington, gardener to Mrs. Banner, Blacklow House, Roby. The second honours for six dishes fell to Mr. Oldham, gardener to Joseph Beecham, Esq., Ewanville, Huyton, who had grand Black Hamburg and Buckland Sweetwater Grapes. For four bunches of Grapes Mr. Bennett staged well finished Madresfield, Black Hamburg, Buckland Sweetwater, and a fine bunch of Duke of Buccleuch. Mr. G. Middleton, gardener to R. Pilkington, Esq., being second with grand bunches but not quite finished. For two bunches of Black Hamburg Mr. Middleton staged two which for size of berry and bunch, colour, and shape have never been surpassed. Mr. Oldham was a capital second. Mr. Middleton took the lead with Muscats, and second with grand bunches of Madresfield Court not quite finished; the first prize going to Mr. W. Wilson, gardener to H. Cunningham, Esq., Gorse Cop, Gateacre, for smaller bunches but beautifully finished. For any other white Mr. J. Gray, gardener to Sir G. Meyrick, Bart., Bodorgan, for gigantic bunches of Foster's Seedling. Messrs. Gray and Bennett were first and second with green flesh Melon, both showing Hero of Lockinge, Messrs. Bennett and Pinnington securing the scarlet flesh class with Sutton's A1. The latter exhibitor won with six dishes of hardy fruits.

The classes for Strawberries, Cherries, and best arranged basket of fruit fell to Messrs. Stoney and Cromwell.

Vegetables call for no special comment with the exception of the twelve varieties, eight, and six. In the two former Mr. J. Stoney took first honours. In the former he had Dickson's Scarlet Carrot, Giant Rocca Onion, Perfection Tomato, Early Puritan Potato, and Sulham Prize Celery, all very good. The second honours were awarded to Mr. T. Smeatham, Leaton Knolls, Shrewsbury, for superb Rousham Park Hero Onions, Globe Beet, Webb's Favourite Carrot, Perfection Tomato, Satisfaction Potato, and Lyon Leek. The second place in the eight was taken by Mr. J. Pownall, Moss Street, Prescott, he having International Kidney, Sutton's Vegetable Marrow, Early Gem Carrot, and Clayworth Pink Celery. For six varieties Mr. Smeatham took the lead with a repetition of what has already been recorded. The prizes for Peas (two), Potatoes (two), Tomatoes (two), and Cucumbers went to the following—Messrs. R. C. Townshend, gardener to R. T. Lloyd, Aston Hall, Oswestry; J. Norris, Formby; W. Mackarell, Formby; J. Norris, T. Carling, H. Howard, gardener to A. C. Mather, Beechwood, Woolton; and J. Hannagan, gardener to R. C. Naylor, Esq., Hooton Hall, Cheshire. In the cottagers' class Mr. Norris was successful in classes for Potatoes and Tomatoes.

MISCELLANEOUS EXHIBITS.—Cultural certificates were awarded to Messrs. Laing & Mather, Kelso-on-Tweed, for a stand of Germania and Souvenir de la Malmaison Carnations, including the beautiful Lady Middleton, which has flowers of a lovely pink, streaked with bright crimson. This stand found many admirers. To W. Edwards & Sons, Sherwood, Notts, for a new kind of ware called "Edwardine," for Ferns, flowers, &c. To Messrs. T. Davies & Co., Wavertree Nursery, for an excellent stand of herbaceous cut blooms, prominent being a grand selection of Gaillardias. They also exhibited various garden utensils. To the Liverpool Horticultural Co. for wreaths, crosses, and sprays; and to Messrs. J. Forbes & Son, Hawick, for stands of Pansies, Begonias, and herbaceous plants. The Secretary, Chairman, and Committee are to be congratulated on the admirable arrangements of the Exhibition.—R. P. R.

HIGHGATE.—JULY 21ST.

THE thirty-third annual Exhibition of the Highgate Horticultural Society was held in the grounds of The Priory, Highgate, London, N., on the above date by the kind permission of Colonel Stedall, J.P. Being favoured with fine weather there was an excellent attendance of visitors, and the exhibitors turned up in good numbers. A liberal schedule having been provided the exhibits were numerous, diversified, and, as a whole, of fair quality. Apart from the gardeners' section, the amateurs', cottagers', and children's classes were well represented, and excited much interest. Fruit and vegetables in this section were very good.

Specimen plants were well shown. Mr. H. Eason, gardener to B. Noakes, Esq., Highgate, secured the first prize for six flowering stove and greenhouse plants, showing fine specimens. The leading honour for a single specimen plant also went to Mr. Eason, who staged a grand *Ixora*. Mr. J. Brooks, gardener to W. Reynolds, Esq., Highgate, was second with a fine specimen of *Bougainvillea glabra* in this class. Trained *Coleus* plants were also good, the best being staged by Messrs. Brooks and Eason. The last-named exhibitor was also first with Zonal Pelargoniums, the second award going to Mr. H. G. Russell, gardener to H. Mansfield, Esq., Highgate.

Exotic Ferns were very fine, although not numerous. Mr. Eason had the best six plants, which included a magnificent *Davallia Mooreana*, possibly 6 or 7 feet in diameter. The same exhibitor was first for six foliage stove and greenhouse plants. Tuberous Begonias and Gloxinias were best shown by Messrs. Eason, Brooks, H. G. Russell, and W. Wilkinson, gardener to F. Lowe, Esq., Crouch End. Trained Verbenas were a feature not often seen at local shows, and the plants staged gave evidence of careful culture. Mr. G. Quelch, gardener to W. Howard, Esq., Hoscote, Shepherd's Hill, was placed first in this competition. Mr. J. Brooks secured leading honours for Fuchsias and Cockscombs, also for Petunias in pots. Balsams were best shown by Mr. C. J. Webber, gardener to H. Smith, Esq., Muswell Hill; and cut Zonal Pelargoniums by Mr. Eason, who was also awarded first prize for table plants. The leading honours for groups of plants fell to Messrs. Eason and Brooks.

Roses were most numerous in the amateurs' section, although a few were shown in the open classes. Mr. A. Page, gardener to A. Taylor, Esq., New Southgate, was first for twelve bunches, and Mr. J. Bateman, Highgate, second. Mr. Will Taylor, Hampton, staged a "not for competition" box of fresh blooms. Messrs. W. Cutbush & Sons, Highgate, had a collection of hardy flowers and Roses, and Messrs. B. S. Williams and Son, Upper Holloway, a group of miscellaneous plants.

Fruit and vegetables were not very plentiful in the gardeners' section. Mr. H. A. Page, gardener to F. Crisp, Esq., White House, New Southgate, was first for a collection of miscellaneous fruit, and also for white and black Grapes, the latter including some well-grown Madresfield Court. Mr. A. Page was first for a collection of hardy fruit, and also for vegetables. Peaches were best shown by Mr. J. Brooks, who also secured second position for a collection of miscellaneous fruit.

WOODFORD.—JULY 21ST.

THE twentieth annual Exhibition was held on the 21st inst. at Knighton, Woodford. The current Exhibition was quite up to its usual standard, and its recent affiliation to the Royal Horticultural Society proves it is still ready to go forward. The open classes were well filled,

but only the chief classes can be noted here owing to scarcity of space. The amateur classes appear to be steadily gaining ground, while the cottagers are certainly not lagging.

In the open division the class for a group of plants arranged for effect, with the silver medal of the R.H.S., brought out strong competition, though there was no difficulty in selecting the winner, who proved to be Mr. Nicholsson. His arrangement was very effective, and the plants good, Palms, Crotons, Dracenas, Orchids, and Gloxinias being the chief features. Mr. Jeyeph was second with a tasteful arrangement, but quality of plants told heavily against him. Third, Mr. Mobsby, whose arrangement was too formal, though the plants were excellent. The class for six stove and greenhouse flowering plants did not bring out any very special feature. Mr. Cade secured the first prize, his best plants being a good Fuchsia and *Lilium l. album*; Mr. Nicholsson showed fine specimens of *Clerodendron* and *Statice Holfordi*. Third, Mr. Mobsby. Stove and greenhouse foliage plants were better. Mr. Nicholsson was first with a good *Acalypha Macafeana*, *Croton* Mrs. Swan, and *Pandanus Veitchi*. Mr. Tween was second, his best plants being *Latania borbonica* and *Pandanus Veitchi*. Mr. Jeyeph was third with a good *Dracena Baptisti*. Caladiums were a strong feature, Mr. Nicholsson leading with well-grown plants, highly coloured. Second, Mr. Cade, with older varieties and smaller plants. Coleuses were the best we have seen for some years in this district, Messrs. Cade, Tween, and Nicholsson taking the first, second, and third prizes respectively.

Stove and greenhouse Ferns brought out a strong contingent, Mr. Mobsby leading with a good plant of *Todea superba*, Mr. Nicholsson second with a fine *Davallia Mooreana*, Mr. Tween third. Single specimen foliage plant, first Mr. Nicholsson, showing a very fine *Cycas revoluta*, Mr. Cade following with good *Latania borbonica*. Palms were very good indeed. Mr. Jeyeph was first with good plants of *Areca rubra* and *A. Bauri*; second Mr. Tween with *Phoenix rupicola*, noteworthy; third Mr. Willingdale with a fine plant of *Phoenix reclinata*. Hydrangeas found Mr. Jeyeph first with well-flowered specimens. The Begonia prizes were taken by two amateurs, Messrs. Pether and J. W. Jones, both staging good plants. Cut Roses were good, though the recent gales prevented keen competition. Mr. Davis won first place, and Mr. Nicholsson was a close second. Mr. Langlands third. Twenty-four distinct varieties, cut flowers, brought a strong lot. Mr. Mobsby led, followed by Messrs. Nicholsson and Rumball. Hand bouquets were not up to their usual standard, Messrs. Nicholsson and Colville taking the prizes in rotation.

Fruit was excellent, and the classes well contested. Mr. A. Smith was first for three bunches of black Grapes with good Gros Maroc. Mr. Peacock second with well-coloured Hamburgs. In Muscats Mr. Smith was well ahead with five heavy bunches. Peaches and Nectarines also found Mr. Smith first, and Mr. Davis second in both classes. Currants and Gooseberries were very fine. Vegetables were both numerous and good, especially the baskets. Amateurs' and cottagers' classes were well filled, especially in plants and vegetables. Classes for single-handed gardeners were quite a failure. After the complaints these had made about the inequality of their competing with the gardeners in larger places, we are surprised they did not support their own section. Dinner-table decoration was a feature, occupying the greater part of one tent.

Trade exhibitors added their quota to the Show, and were greatly admired. Messrs. W. Paul & Son had a large collection of Roses; Mr. W. Rumsey likewise had an extensive display; Mr. J. B. Riding, Chingford, a collection of Violas and Pansies; Mr. R. Bass, Woodford, some choice Zonal Pelargoniums.

TRENTHAM.—JULY 21ST.

ALTHOUGH the Trentham and Hanford Horticultural Society is distinctly juvenile as regards age, the experience and energy of its active officials have established it in a strong position, and its annual Shows rank amongst the best in the provinces. In some respects the fifth Exhibition, held on the 21st inst., may be fairly described as the best in the kingdom up to date, and it is doubtful if the combined effect that was produced by the groups of plants and display of fruit will be surpassed during the season. Much is expected in the way of fruit at the International Exhibition at Earl's Court next month, and it need only be said that if the show of Grapes equals the Trentham display a great success will be achieved.

For Grapes and groups this year's gathering on the great ducal estate of the Midlands will not be soon forgotten by those who witnessed them on a brilliant day last week. But there was much more to admire than fruit and the tasteful association of plants. Roses were one of the charms of the Show, and the beautiful stands of Messrs. Harkness and Sons, Perkins & Son, and B. R. Cant in the open classes were, so to say, besieged by a dense crowd of visitors throughout the afternoon, and it is not often that the attractive force of Roses has been better exemplified. Bouquets and floral decorations were of the highest order of excellence, while vegetables were in great force and of superb quality, cottagers joining most creditably in this section of the Exhibition.

The Duke and Duchess of Sutherland take great interest in the Show, and with a number of friends, officials, and Judges were photographed in the chief tent during the opening ceremony. The luncheon is also a notable event at Trentham, and nearly 200 ladies and gentlemen must have assembled on the occasion under notice. Speeches were delivered by three Mayors, as well as by Judges and officials, all having the true horticultural ring in them, and the gathering was very enjoyable.

Turning to the Show only its general character can be described, and this chiefly from memory; for when a chronicler has to first to assist in

the adjudications he finds in such shows as this a great inrush of people as soon as his primary work is done, and note-taking then results in a series of pocket-book hieroglyphics, almost hopelessly undecipherable. The groups, it has been said, were a chief feature, and it was only right they should be, seeing that no less than £62 was offered in four prizes in the open class—namely, first prize, £25; second, £16; third, £12; and fourth, £9. Each group occupied a space of 300 feet, and as five collections, square in outline, but the front line curved, were arranged, a striking effect was produced. It was apparent at a glance that the Judges, Messrs. John Wills, Onslow Crescent; Owen Thomas, Frogmore; and F. Sander, St. Albans, had no light task, and it was only after a long and close scrutiny that they could satisfy themselves in their verdict, which was as follows:—First, Messrs. J. Cypher & Son, Cheltenham; second, Mr. J. McIntyre, gardener to Mrs. Gurney Pease, Darlington; third, Mr. J. Edmunds, gardener to the Duke of St. Albans, The Gardens, Bestwood, Notts; and fourth, Mr. J. Webb, gardener to J. H. Manners Sutton, Esq., Kelham Hall, Notts. Though collectively the display was a striking one, and the competition close, yet all the groups were more or less faulty. The most apparent error was in employing too many plants; and it was presumably because there was a less avoidance of crowding in Messrs. Cypher's arrangement that it was awarded the chief prize. The plants consisted largely of small Orchids and Francoas in a groundwork of moss, with raised specimens of Orchids and Ferns, under a canopy of large Palms. There was a general want of balance in the group, which was not improved by a hedge-like divisional line through it, and the margin was rather weak, yet there was a general consensus of opinion that it deserved the position accorded. Mr. McIntyre's group was very rich and heavy, in fact too heavy, and several of his undoubtedly good plants of Crotons and Palms did not stand out with sufficient distinctness. It was boldly undulated, and had an imposing effect. Mr. Edmunds' was of much the same character. Some golden Crotons stood out to great advantage, but he had employed rather too many plants of a grassy nature—Panicums and the like—that imparted a somewhat bristly appearance, yet it was a charming group. The fourth prize collection was a little more free, and would have been easily first in many competitions. The beauty of the plants was, however, certainly not enhanced by the very brown, indeed almost black, patches of moss in the groundwork. The groups extended down one side of a very large marquee, Roses being arranged down the other side, the central table being devoted chiefly to fruit, the remaining space attractively occupied by bouquets and floral decorations.

In the Rose classes many growers who had entered were unable to send blooms in consequence of the storms that shattered them in several districts. The display, therefore, was not so extensive as that of last year, but the stands of Messrs. Harkness, Perkins, and B. R. Cant made a show in themselves, worth going a long way to see. In the classes for forty-eight and thirty-six blooms, also for twenty-four triplets, Messrs. Harkness won the first three prizes, Messrs. Perkins the three seconds, and Mr. Cant the thirds in each class. The Essex veteran exhibited well, but the fixture was evidently a little too late for him, but appeared to suit the Yorkshire Roses to a day, for fresher, smoother, cleaner, and brighter blooms could scarcely be imagined. But good as they were the Coventry Roses were worthy rivals, and it was something of a triumph to defeat them. The varieties in the first prize forty-eight stands were as follows:—Back row: Gustave Piganeau, Her Majesty, Marie Baumann, Mrs. Jno. Laing, Alfred Colomb, Mrs. G. Dickson, Dupuy Jamain, Heinrich Schultheis, U. Brunner, Queen of Queens, Star of Waltham, S. M. Rodocanachi, Louis Van Houtte, Marie Verdier, Etienne Levet, Lady Mary Fitzwilliam. Middle row: Duchesse de Morny, Duchess of Bedford, Niphetos, Horace Vernet, Maréchal Niel, Xavier Olibo, Mdme. G. Luizet, Comte de Raimbaud, Mrs. Harkness (grand light pink sport of Heinrich Schultheis, very fine), C. Lefebvre, Viscountess Folkestone, Abel Carrière, M. de Lyon, A. K. Williams, Countess of Rosebery, Dr. Andry. Front row: B. Joubert, Comtesse de Serenye, Charles Darwin, Captain Christy, Earl Dufferin, Emilie Hausburg, J. S. Mill, La France, Prince Arthur, Pride of Waltham, Senateur Vaisse, Violette Bouyer, Victor Hugo, Marie Finger, Marie Rady, Duchesse de Vallombrosa.

Messrs. Harkness were first in the classes for twelve blooms of any light with, if we remember rightly, Mrs. J. Laing, followed by Messrs. Dicksons, Chester, with Merveille de Lyon. Only one stand of dark velvety Roses was, we think staged—namely, Jean de Lilliere by Messrs. Perkins & Son, a variety of the Prince Camille de Rohan type originally obtained from Mr. Bennett, and was awarded the first prize. For stands of blooms of any other colour, Messrs. Frettingham, (Beeston), Perkins, and Dicksons secured the prizes, the first and last with Marie Baumann, and the second with A. K. Williams. Several creditable stands were exhibited in the local amateur classes, and altogether, judging by the crowds that flocked round them, the Roses though numerically weak, were a very strong feature of the Show. There was a beautiful display of floral table decorations from Messrs. Jenkinson and Sons, Newcastle, for which we understand a silver medal was granted, and these exhibitors had the rare honour of defeating Messrs. Perkins & Sons with both bridal and ball bouquets. It was a case of freedom against formality, and freedom won.

Of fruit, as has been said, there was a remarkable display, and a remarkable event occurred at the commencement of the judging, for that old hand at exhibiting and strong competitor, Mr. J. McIntoe, was disqualified. This was in the chief collection of fruit, and the first prize £10. The terms of the schedule were "nine dishes, to include two varieties of Grapes, one black and one white, three bunches of each, one

Melon and one Pine." Two Pines were staged, and hence the disqualification. The words "to include" led the exhibitor astray; but they ought not to have done, for specific words to include "one Pine" cannot very well mean the collection may include two Pines; all the same, it is desirable that only one possible meaning can attach to the terms employed in schedules. However, Mr. McIntoe had perhaps as good consolation as anyone could desire under the circumstances, for he was very properly adjudged the special prize that was offered by Messrs. Dickson, Brown & Tait of Manchester for the "best exhibit of fruit in the Show." The three prizes in the collection referred to fell to Mr. J. H. Goodacre, Elvaston Castle; Mr. R. Dawes, Temple Newsam; and Mr. T. Bannerman, Blithfield. Mr. Goodacre had heavy dishes of Black Hamburg and Foster's Seedling Grapes; Peaches, Nectarines, and Cherries being also well represented. In the collection of six dishes Mr. Bannerman was first with splendid Duke of Buccleuch and Black Hamburg Grapes, very fine Lord Napier Nectarines, and Royal George Peaches, a good Melon, and President Strawberries. Mr. W. Elphinstone, Shipley Hall, a close second. In the class for four bunches of Grapes in two distinct kinds Mr. Craven, gardener to J. Grant Morris, Esq., won the first position with splendid examples of Madresfield Court and Black Hamburg; Mr. Allsop, gardener to Lord Hotham, second; and Mr. Elphinstone third. Mr. A. McVinish, gardener to N. E. Curzon, Esq., Lockington Hall, was first with three bunches of Black Hamburg, Messrs. Craven and Bannerman following in splendid competition; and for Muscats the winners were Messrs. Elphinstone, McIntoe, and McVinish. In the any other white variety class Mr. Bannerman was first with Foster's Seedling and Mr. Allsop second, and in the corresponding black class Mr. Wilkes, gardener to Mrs. Meakin, and Mr. Craven were the chief winners with Madresfield Court. It may be said that the competition was severe throughout, and that about 300 bunches of excellent Grapes were staged. Melons were numerous, Peaches, Nectarines, Cherries, and Strawberries, fine huge fruits of James Veitch winning the chief prize for Mr. Elphinstone.

Vegetables in competition for the several prizes offered by Messrs. Carter and Co., Sutton & Sons, Webb & Co., and others brought out a splendid competition, and fine Mushrooms were staged for Mr. Bason's prizes. Cottagers staged both vegetables and small fruit well, the Society evidently doing great good in stimulating to high cultivation.

Among the special prizes offered was a silver medal to Mr. Jennings, gardener to Leopold de Rothschild, Esq., for magnificent Souvenir de Malmaison Carnation. Silver medals were also awarded to Messrs. Cutbush & Sons, London, and Messrs. Hewitt of Solihull for flowers. This is a mere outline report of a really fine Show, creditable alike to exhibitors and zealous officials, and appreciated by thousands who visited and passed through the beautiful grounds of Trentham. It may be added that Mr. Blair received an ovation at the luncheon, and in the course of a few months he will take with him the best wishes of all when he enters on his new career as host of the Trentham Hotel, of which a lease has been granted to him by the Duke of Sutherland.

WORKSOP.

THE third annual Exhibition of this new and progressive Society was held recently on the Newcastle Avenue Cricket Ground. Considering the years on the head of this, one of the latest interesting ventures of the town, it has made wonderful progress. In a great measure this is to be accounted for by the fact that the patronage and support from the outset has been of the very best the district could give, including the Duke of Newcastle, the Duke of Portland, Mr. Henry Vessey Machin (who may be put down as the father of the Rose portion), and all the leading gentlemen of the district, and many ladies. The Secretary is Mr. George Baxter, Worksop, assisted by his son, Mr. Arthur G. Baxter; the Treasurer, Mr. James Snow Whall; Vice-President, Mr. Henry Vessey Machin, J.P.; President, His Grace the Duke of Portland. The work of the Committee and officers of the Society had been well carried out, and nothing had been left undone which would tend to make the Show a success. The result of this was that not only was the large tent in which the Exhibition was held well filled, but the number of exhibitors was much in excess of last year, numbering 644, about 100 more than on either of the two previous occasions.

The show of Roses was hardly up to expectations, either as regards quantity, number of exhibitors, or the quality of the exhibits. This is solely to be accounted for by the singularly unsatisfactory sort of weather which for the last three weeks has prevailed over the county, coming at a time when Roses in general were approaching their best. Still the display was of a very high order, and many of those who visited the Exhibition would not have known, unless told, that many of the Roses were what is known as "grubby," this being due to the wet weather, which had also dashed to some extent many of the finest blooms. Among the successful exhibitors of Roses were Messrs. H. V. Machin, Gateford Hill; H. Merryweather & Son, Southwell; F. Cant, Colchester; B. R. Cant, Colchester; Mrs. Alderson, Worksop; Mrs. Mellish, Hodsock; Thos. Clifton, Gateford; Chas. Stubbings, Gateford; Samuel Howard, Carlton; Henry Stewart, Carlton; John Padley, Carlton; A. Whitlam, Carlton; George Howard, Carlton; J. Stanley, Carlton; Alfred Barker, Gateford; G. W. Jones, Worksop; Richard Lee, Worksop; A. Simpson, Worksop.

Among the non-competitors who exhibited were the Duke of Portland, a magnificent group of plants in flower and otherwise, and he also sent a quantity of flowers and plants for decoration purposes; the Duke of

Newcastle, shrubs and flowers; Mr. H. V. Machin, Gateford Hill, his collection including plants of a very interesting nature; Messrs. Fisher, Sons & Sibray, plants and Roses, the former being banked in a capital manner at one end of the tent—a collection of stove and greenhouse plants; T. Marris, Worksop—a fine lot of tuberous Begonias, at one end of the staging; Bruce Greaves—Pansies and Ferns in particular; Elston & Son—a show of Gaillardias; Brown, Dixon, & Tait, Manchester—a stand of plants and some fine trays of Roses; and Messrs. Cant of Colchester, whose display of Roses was very fine indeed. Messrs. Pearson & Sons of the Chilwell Nurseries, Nottingham, sent for exhibition a most magnificent cross, which was composed of white Lilies and Ferns set on a ground of black velvet. This was one of the best things in the florists' art, and attracted all who entered the Exhibition.

A special feature of the Exhibition was a fine display of garden Roses from the garden of Mrs. Mellish, Hodsock. These attracted particular attention, and were a good addition to the attractions of the whole. There was shown by Mr. Mallinder of Hodsock a new bloom not yet in commerce in England, known as Duarte Olleive, which was shown for the first time at Chester a few days before, where it attracted considerable attention. Mr. Machin of Gateford Hill must be mentioned particularly as a competing and non-competing exhibitor, and the numerous specimens sent by him from his gardens at Gateford were of the greatest merit considering the sort of weather, which has made it next to impossible to bring Roses to exhibition this year in a perfect condition.—(*Retford Times*.)

NATIONAL PINK SOCIETY.—NORTHERN SECTION.

THE Northern Show of the above Society was held in the Botanical Gardens, Manchester, on Friday, July 22nd, in connection with the Rose Show. There was about the same number of exhibitors as last year, but with the exception of Mr. Campbell's blooms the flowers generally showed the effects of the gale on the Tuesday before the Show, there being a palpable lack of quality in most of the stands.

In the class for twelve blooms, six at least dissimilar, first Mr. Campbell, florist, Blantyre, N.B., with two blooms of Boiard, both very fine; Fellowes's Pandora, a fine back-row flower; Minerva, Leah, Mr. Campbell, a fine flower; Mr. James Minty, a promising flower; Godfrey, Emmeline, with very fine broad petal; Grace Simon, very rich in colour but the petal is faulty; Device (Maclean's), a wonderfully fine bloom of this old variety, and Bertha, fine. Second, Mr. A. Brown, Handsworth, with Bessie, Amy, Minerva, a very fine bloom, which was also the premier red laced; Emerald, Modesty, fine; Empress of India, fine; Bertha, Zoe, Godfrey, very fine; and Harry Hooper. Third, Mr. S. Barlow. Fourth, Mr. C. F. Thurstan.

For six blooms, dissimilar, first, Mr. Campbell, with Boiard, Minerva, John Drake, very bright; Princess of Wales, Emmeline and Modesty, both fine. Second, Mr. C. F. Thurstan, with Duke of York, Boiard, Modesty, Ada Louisa, and seedling marked $\frac{1}{2}^5$, which seems to be even finer than Duke of York. Third, Mr. J. Edwards, Blackley. Fourth, Mr. Barlow. Fifth, Mr. Bcswick, Middleton.

For six blooms, three dissimilar, first, Mr. A. R. Brown, with Emerald, Bertram, and two each of Amy and Bertha. Second, Mr. Barlow, with Mrs. Dark (2), Boiard, Harry Hooper, Brown's Clipper, and James Thurstan. Third, Mr. Edwards. Fourth, Mr. Thurstan. Fifth, Mr. Taylor, Middleton.

For three blooms, one purple laced, one red laced, and one black-and-white, first, Mr. Taylor, with Miss Pomeroy, Alderman Thorpe, and a seedling. Second, Mr. Edwards. Third, Mr. Thurstan. Fourth, Mr. Bentley. Fifth, Mr. Barlow. Single bloom, purple laced, first Mr. Campbell, with a splendid bloom of Boiard; second, the same, with Emmeline. Third, Mr. Cliff, Leeds, with Boiard. Fourth, Mr. Brown, with Bertha. Fifth, Mr. Taylor, with a seedling. Sixth, Mr. Barlow, with James Thurstan. Red laced, first, Mr. Campbell, with Maclean's Clara, an old variety. Second, Mr. Brown, with a small bloom of Amy. Third, Mr. Campbell, with Godfrey. Fourth, Mr. Brown, with Modesty. Fifth, Mr. Thurstan, with Empress of India. Sixth, Mr. Barlow, with Mrs. Dark.

Collection of Pinks in bunches, first, Mr. T. Walkden, Moorside Nursery, Sale, with a fine collection of border varieties.

The premier purple laced was Boiard, exhibited by Mr. Campbell in the single bloom class. The premier red was Minerva in Mr. Brown's stand of twelve.

LINARIA PELORIA.

At the Drill Hall on July 14th, the Floral Committee of the Royal Horticultural awarded Mr. W. Marshall a first-class certificate for a specimen of this plant, of which a flowering spray is represented in fig. 13, is an example of a peculiar phenomenon that is occasionally observed in flowers, and is termed Peloria. This consists in the transformation, or, according to some botanists, the reversion, of what are usually irregular corollas to a regular form. For example, in the Linarias and Antirrhinums the corollas have commonly a two-lipped form, to which the term "personate" is applied, the chief difference between the two being that the corollas of the Linarias are furnished with a spur at the base, and those of the Antirrhinum are without this appendage. In the case of the variety Peloria, however, this two-lipped form quite disappears, the upper part assuming a conical shape with the extremity five-cleft and sharply revolute, the base being

furnished with five spreading spurs, giving the flowers a totally different appearance.

The species itself is an attractive plant, but this variety is superior to it, as the flowers are produced so abundantly that they form a dense spike 6 to 9 inches or more in length, and of an extremely pleasing yellow colour. As a garden plant it is much appreciated both on account of its peculiarity and its beauty, and as it is readily increased by its roots a stock can soon be obtained. Occasionally fine specimens may be seen at exhibitions where classes are provided for hardy plants, and they form some of the most effective for such collections.

FIG. 13.—LINARIA PELORIA.

Though not very common, this Linaria has been long known both to cultivators and botanists. Plants of the variety Peloria have been found wild in several parts of Great Britain, but it is rare.

NATIONAL CARNATION AND PICOTEE SOCIETY. SOUTHERN SECTION.—JULY 26TH.

THE annual Exhibition of the Southern Section of the National Carnation and Picotee Society was held in the Drill Hall, Westminster, on the above date. It was the opinion of a well-known expert that the Society has never had a finer Exhibition, the blooms staged being numerous and of a first-rate quality. In some classes they were beyond the usual standard, whilst in others the various exhibitors fully maintained their reputation as florists. The names of the principal prizewinners are embodied in the following notes.

CARNATIONS.

In the class for twenty-four Carnations of not less than twelve varieties there were five competitors, and the competition was very keen. Eventually, however, the first prize was awarded to Mr. J. Douglas, Great Gearies, Ilford. The varieties shown by this exhibitor were as follows:—Back row: Homer, Thalia, Chas. Henwood (two), Eurydice (seedling), Lady Mary Curry (seedling), Phoebe, and a seedling. Middle row: Phoebe, Robert Lord, Rob Roy, Robt. Houlgrave, Virgil (seedling), Alisemond, and W. Skirving. Front row: Sarah Payne, Mrs. J. Graham, seedling (three), Miss C. Graham, J. Crossland, Rob Roy. Mr. C. Turner, Slough, was second; the other prizes going to Messrs. Rowan, Clapham, and F. Hooper, Bath. The flowers were good in each case. Mr. Rowan was first for twelve blooms, showing grand flowers. The varieties were Thalia, J. S. Heddersley, George Melville, Robert Lord, J. D. Hextall, Gordon Lewis, Alisemond, Sarah Payne, Alfred, Sportsman, Edward Rowan, and Robert Houlgrave. Mr. C. Phillips, Reading, was second; Mr. H. W. Headland, Leyton, third; Mr. G. Chaundy, Oxford, fourth; and Mr. R. Vesey, Clapham, fifth. Mr. J. Keen, Southampton, secured the first prize for six blooms, showing Sarah Payne, Gordon Lewis, Lovely Mary, W. Skirving, Fred, and Matador. Mr. J. Lakin, Oxford, was second; Mr. T. Catley, Bath, third; Mr. F. Nutt, Southampton, fourth; Mr. W. L. Walker, Reading, fifth; and Mr. T. Anstiss, Brill, sixth.

Single specimens were numerous and well shown. Mr. Lakin had the best rose-flaked, showing a grand bloom of Sybil. Mr. Turner was second, and Mr. Hooper third. Mr. Douglas showed the best scarlet bizarre; and Mr. J. Keen had the best purple flaked, a fine bloom of George Melville. Mr. Hooper and Mr. Rowan were also first prize-winners for single specimens.

PICOTEEES.

These were very good. For twenty-four blooms, not less than twelve dissimilar varieties, there were five competitors, the blooms in each stand being even and fresh. Mr. Douglas was again first with excellent flowers. His stand comprised:—Back row: Seedlings (four), Liddington's Favourite (two), Mrs. Bower, Brunette. Middle row: Her Majesty (two), Violet Douglas, Brunette, Miss Floudy (seedling), Mrs. Bower, and Lady Holmesdale. Front row: Seedlings (five), Lady Holmesdale, Amy Lord, and Mrs. Sharp. The premier Picotee bloom in the Show was in this stand. It was a remarkably fine Liddington's Favourite. Mr. C. Turner was second; Mr. Rowan third; and Mr. J. Walker, Thame, fourth. For twelve Picotees, dissimilar, Mr. C. Phillips was first, showing a stand of grand blooms. The varieties were Jessie, Zerlina, Orlando, Muriel, Brunette, Mrs. Ricardo, J. B. Bryant, Mrs. Sharp, Lady Curzon, Moura, Mrs. Gonton, and Tourist. Mr. W. Headland was second; Mr. Rowan third; Mr. Chaundy fourth; Viscountess Chewton fifth, and Mr. Vesey sixth. Mr. J. Keen was placed first for six blooms, showing Norman Carr, Favourite, Ethel, Isabel Lakin, Madeline, and Clara Penson. Mr. Lakin secured a second place, the other prizes going to Mr. J. Rebbeck, Southampton; Mr. T. Catley, Bath; Mr. F. Nutt; and Mr. A. Green field, Sutton, Surrey.

For twelve yellow-ground Picotees, Mr. Douglas was first with grand blooms of Aurora, Mr. R. Sydenham, Remembrance, Lillian, Mrs. Henwood, and seedling. Mr. Turner was second; and Mr. C. Phillips third. Mr. F. Hooper, Bath, secured first honours for six yellow grounds; Mr. F. Nutt being second; Mr. F. Kew, Southend, third; Mr. J. Keen, fourth; and Mr. Lakin, fifth.

Single specimens of these were also numerous. Mr. Keen was first for the pink heavy edged, showing a fine bloom of Mrs. Sharp. Mr. Douglas secured first honours for the heavy-edged purple, a fine bloom of Muriel. Mr. Turner was first for a light-edged crimson, showing Thos. Williams, Mr. Headlands being second.

MISCELLANEOUS SELFS AND FANCIES.

Mr. C. Turner was awarded first for twenty-four blooms, twelve dissimilar varieties. Mr. Douglas was a close second with a stand of grand blooms; the other prizewinners being Martin Smith, Esq., third; Mr. Rowan, fourth; Mr. Hooper, fifth. Mr. J. Keen secured first honours for twelve blooms dissimilar, the second prize going to Mr. Nutt. Mr. W. Headland and Mr. Anstiss were also awarded prizes in this class.

Mr. Turner was first with twelve specimens in pots, the varieties shown being Harmony, Romulus, Tona, Mrs. L. Jamison, Charles Henwood, King of Scarlets (good), Duchess of Sutherland, Ruby, Favourite, Mrs. Clements, Victory, and Mrs. Nicholay. Mr. Douglas was second, and Mr. Martin Smith third. Mr. M. Rowan was awarded "The Gardeners' Magazine" silver medal for general excellence.

MARTIN SMITH PRIZES.

These prizes were offered by Martin Smith, Esq., with a view to encourage the culture of border Carnations, the exhibits being staged without "dressing." Mr. J. Douglas was first for the best border variety, showing a bright scarlet seedling named Oriflamme. Mr. Thoday, Willington, Cambs, was second with a new white seedling, Florence Emily Thoday, and Mrs. Jones, Kensington (gardener, Mr. W. Barton), third. For six self-coloured varieties Mr. F. Hooper was first with Gaiety, Queen of Purple, a seedling white, Lady Constance, Gluck, and Lady Cavendish. The second prize went to Mr. Douglas, and the third to Mr. Herrington, Shrubland Park, Suffolk. Mr. Hooper was also first for nine varieties, any section, Mr. Douglas coming in second. Mr. Douglas secured leading honours, however, for flaked Carnations and Picotees in this section.

STOCKPORT SHOW.

THE Stockport and District Chrysanthemum and Fruit Show has been fixed for Friday and Saturday, November 18th and 19th. Schedules are now being issued.

NATIONAL CHRYSANTHEMUM SOCIETY.

For several years past it has been the practice of this Society to arrange an annual outing or holiday for its members. When first commenced the party was comparatively small, but so attractive has the annual picnic become that a large party of the members are now found partaking in the holiday. The outing for this year took the form of a visit to Penshurst Place, Kent, the seat of Lord De Lisle and Dudley, and Redleaf, the residence of F. C. Hills, Esq., which is midway between Penshurst Station and Penshurst Place. A party of seventy persons left Charing Cross by an early train, prominent among them were Mr. R. Ballantine, Chairman; Mr. R. Dean, Secretary; and Messrs. A. J. Veitch, N. Davis, G. Stevens, B. Wynne, G. J. Ingram, &c., several ladies also joining the party. Penshurst Station was reached at eleven o'clock, and the company proceeded to the eastern entrance to Redleaf, where they were met by Mr. W. Holah, the gardener, and conducted through the grounds. Redleaf is well known as one of the prettiest and best kept places in the county of Kent; it is finely undulated, well wooded, and from certain eminences very fine views can be obtained of the surrounding country. At every point the visitor comes upon some objects of great interest. The mansion occupies a commanding position near the roadway to Penshurst, it is modern in style and commodious. There is a handsome terrace garden which is extremely gay, and from this point the grounds fall away in delightful undulations. There are many fine timber trees, some splendid examples of Coniferae, choice deciduous trees and shrubs, and a luxuriant undergrowth of evergreens. Adjoining the mansion is a spacious fernery charmingly arranged, and having in the centre a crystal fountain; there are also plant and Orchid houses. About the grounds are examples of various styles of flower gardening, lovely dells, and cool grots; the forcing houses and kitchen gardens are examples of high culture.

Leaving Redleaf by Mr. Holah's residence the party entered the spacious park of Penshurst, with its noble timber trees of Beech, Oak, Elms, &c., its acres of Ferns, and its stretches of hill and dale. Near the Castle is the cricket ground, and a match of cricket was at once commenced between elevens representing the National Chrysanthemum and the Sevenoaks Gardeners' Society, the former captained by Mr. E. Rowbottom, and the latter by Mr. S. Cooke. At two o'clock a party of 100 sat down to dinner in a spacious tent erected within the park, Mr. R. Ballantine presiding. At the close of an admirably served repast the health of Lord De Lisle, with thanks for the permission to visit the Castle grounds, was proposed by the Chairman, and that of Mr. F. C. Hills by Mr. R. Dean, who made reference to the fact that sixty or seventy years ago Mr. William Wells, who resided at that time at Redleaf, was a noted horticulturist, and one of the first to cultivate the Chrysanthemum for exhibition purposes. To these toasts Mr. F. Bridger, the gardener at Penshurst Place, and Mr. W. Holah, suitably responded. The cricket elevens were proposed by Mr. A. Wortley, at one time the Secretary of the old Stoke Newington Chrysanthemum Society, and a successful exhibitor many years ago, and responded to by Messrs. Rowbottom and Cooke. The healths of the Secretary and Chairman were also given. The cricket match was then resumed, and the London team eventually proved the winners, their opponents being out-played at all points. Meanwhile parties visited the Castle at intervals, and were conducted through the state apartments, with their many historical associations, the old-fashioned terrace gardens, and the kitchen garden department; the picturesque village and church were also inspected. Tea was served at half-past five o'clock. After tea came a go-as-you-please interval, and finally the party left Penshurst soon after eight o'clock highly delighted with the outing, which proved most successful in all respects. The weather was all that could be desired, and this portion of the county of Kent was seen to the best advantage.

ROSE SHOWS.

NORTH LONSDALE.—JULY 22ND.

THE ninth annual Exhibition of the North Lonsdale Rose Society, which is affiliated with the N.R.S., was held in the Drill Hall, Ulverston, on Friday last, and as usual much interest was taken in what is deservedly regarded as the most important floral fête in North Lancashire. The generosity of subscribers and donors of special prizes enabled the promoters to offer over £50 in addition to four bronze medals of the National Rose Society for Roses and a silver medal for Pansies. Owing to clashing of their fixture for the first time with the Manchester Rose Show, and again to the stormy weather which was experienced during the early part of the week, the display of Roses amongst the professional element was smaller than usual, but the

quality was equal to that of former years. Messrs. Dicksons, Limited, Chester, and Messrs. Harkness, Bedale, did not put in an appearance, so the battle was fought out between Messrs. Dickson & Sons, Newtownards, Co. Down, B. R. Cant of Colchester, and Mr. J. Crombie of Barrow. The representatives of the Emerald Isle carried all before them, taking the first prize in each of the nine classes. Their Roses were remarkable for size, perfect shape, and splendid colour, in a word admirable. Their new seedling Mrs. W. J. Grant, which was awarded the gold medal at Chester on the 16th, had again a first-class certificate appended to it. Mr. B. R. Cant made a splendid show, as did also Mr. J. Crombie. Amateurs showed in much better form than usual, J. H. Midgley, Esq., J.P., of Grange, carrying off no fewer than six firsts, one second, and a third in addition to three bronze medals; the other being awarded to Mr. John Abbott, Greenodd. Other fortunate exhibitors were the Rev. R. T. Langtree, Grange, and Mr. J. T. Marsden, Silverdale. There was also a grand display of Pansies, the principal winners being Mr. H. Rothery, Pennybridge, who was also awarded the silver medal; Mr. A. Ratson, Kendal; Mr. George Browne, Troutbeck; and Mr. J. Sharp, Carnforth. Mr. George Paul, Bridge of Weir, exhibited a splendid stand not for competition. Another very attractive feature of the Show was the beautiful assortment of hand and table bouquets.

The following are the principal prizetakers, but as the blooms are all the same varieties which have already been exhibited this season it is not necessary, except in one or two instances, to repeat the names. Roses (open class).—Twenty-four Roses, distinct, three trusses of each.—First, Messrs. Alex. Dickson & Sons, Newtownards; second, Mr. B. R. Cant, Colchester. Forty-eight, distinct, single trusses.—First, Messrs. A. Dickson & Sons; second, Mr. B. R. Cant. Twenty-four, distinct.—First, Messrs. A. Dickson & Sons; second, J. Crombie, Barrow. Eighteen Roses, distinct, six dark and six light H.P., and six Teas or Noisettes.—First, Messrs. A. Dickson & Sons; second, Mr. J. Crombie. Twelve Teas or Noisettes.—First, Messrs. A. Dickson & Sons; second, Mr. J. Crombie. Twelve single trusses, any dark H.P.—First, Messrs. A. Dickson & Sons; second, Mr. B. R. Cant. Twelve single trusses, any light H.P.—First, Messrs. A. Dickson & Sons, with La France; second, Mr. B. R. Cant. Twelve new Roses, distinct.—First, Messrs. A. Dickson & Sons, the same exhibitors taking the prize for the best seedling Rose with Marchioness of Londonderry, and the best Rose in Show with the same variety.

In the amateurs' section Mr. J. Curwen, gardener to J. H. Midgley, Esq., secured first prizes for eighteen Roses distinct, six Teas distinct, light or dark varieties, six Teas or Noisettes distinct, best light bloom H.P. with La France, best dark H.P. bloom with Marie Baumann (bronze medal), best Tea or Noisette with Souvenir d'Elise Vardon (bronze medal), Mr. J. McKay, gardener to Rev. R. T. Langtree, was first for twelve Roses and four Teas. Mr. J. Abbott secured a bronze medal in local classes for La France, and also first for six Roses distinct. The first in the class for those who have never won a prize was taken by Mr. Case, Lyndene, Ulverston. For three Roses Mr. T. Higgin, and the prize for six, any light or dark, by Mr. C. Watson, Station, Ulverston. The best bouquet came from Mrs. Woodburne, Thurstonville. Space will not permit referring further to Pansies, but the principal prizewinners have been already mentioned. Mr. G. H. Mackerett (Hon. Sec.), Mr. T. Parker (Assist. Hon. Sec.), Mr. T. W. Mason (Chairman), Mr. H. Longson (Hon. Treasurer) and the excellent Committee deserve every credit for the way in which all was brought to a successful issue. The medals were presented to the winners during the afternoon by Mrs. Myles Kennedy, Ulverston.—R. P. R.

MANCHESTER.—JULY 22ND AND 23RD.

In addition to the attractions of "Old America" at the Manchester Royal Botanical Gardens there was held on the above dates the annual Rose Show of the Manchester Royal Botanical and Horticultural Society, and in conjunction with it the Exhibition of the National Pink Society. Fine weather favoured both the opening and the second day, being for all but the flowers in the Exhibition a most agreeable and pleasant change. Under the expansive glass roof of the avenue where the exhibits were staged the hot sunshine and the heated atmosphere made serious inroads on the quality and the freshness of the flowers, the Roses especially. The exhibits of Roses were somewhat below the numbers of previous years, doubtless owing to the unusually stormy and wet weather of the preceding days. The Exhibition, however, was good as a whole, considering the weather recently experienced.

The following are the awards:—Nurserymen's class, seventy-two distinct, single trusses.—First, Messrs. Harkness & Sons, Bedale, Yorkshire. These northern growers had splendid blooms, beautifully fresh, clean, bright, and even. The varieties were—Back row: Mrs. J. Laing, Marie Baumann (superb), Mons. Noman, Marie Verdier, Viscountess Folkestone, Heinrich Schultheis, Duchesse de Vallombrosa, Alfred Colomb, Gustave Piganeau (good), La France, Alphonse Soupert, Comtesse de Serenye, Suzanne Marie Rodocanachi, François Michelin, Prince Arthur (rich), Mrs. Geo. Dickson, Ulrich Brunner, The Bride, Earl of Dufferin (small, but full bloom), Princess Beatrice, Dr. Andry (handsome), Lady Mary Fitzwilliam, Marie Rady, and Captain Christy. Second row: Dupuy Jamain (excellent), Magna Charta, Général Jacqueminot (deep, rich), Maréchal Niel, Fisher Holmes (splendid), Queen of Queens, A. K. Williams (magnificent), Baroness Rothschild, Star of Waltham (perfect), Mons. E. Y. Teas, Mary Bennett, Reynolds Hole, Madame Hoste, Maurice Bernardin (splendid), Marquise de Castellane, Victor Hugo, Violette Bouyer, Duchess of Bedford, Innocente Pirola, Charles Lefebvre (magnificent), Souvenir d'Elise Vardon, Comte de Raimbaud, Madame Cusin, Etienne Levet. Front row: Marie Finger,

Beauty of Waltham, Elie Morel, Camille Bernardin (superb), Merveille de Lyon (excellent), Rosieriste Jacobs (good), Pride of Waltham, Baron Haussman, Duc de Rohan (splendid), White La France, May Quennell (full, good), Merrie England, Barthélemy Joubert, Mr. Harkness, Alfred Dumesnil, Catherine Mermet, Madame Charles Wood, Madame Gabriel Luizet, Charles Darwin, Her Majesty (good), Horace Vernet (good), Madame Joseph Desbois, Countess of Oxford, Duchesse de Morny (splendid). Gustave Piganeau was the best bloom in the collection, being regular developed, with splendid full centre. Mr. H. Merryweather, Southwell, Notts, was second, and Messrs. Cranston & Co. Limited, Hereford, third.

In the class for thirty-six distinct, three trusses of each, Mr. H. Merryweather, Southwell, was first with Mrs. John Laing, Maurice Bernardin, La France (excellent blooms), Earl of Dufferin (treble unnamed), Gustave Piganeau, Captain Christy, Souvenir d'Elise Vardon, Duchess of Albany, Gloire de Margottin, Francisca Krüger, Etienne Levet, Marie Van Houtte, Victor Hugo (good), Antoine Ducher, Comtesse de Serenye, Baroness Bothschild, Dr. Andry, Catherine Mermet (good), Violette Bouyer (splendid), Thomas Mills, Souvenir d'un Ami, Suzanne Marie Rodocanachi, Star of Waltham, Madame Hoste, Marie Baumann (splendid), Viscountess Folkestone, Madame G. Luizet, A. K. Williams, Comtesse Hy. Pignon, Grandeur of Cheshunt, Heinrich Schultheis, Madame Lambard, The Bride (very good), and Mons. E. Y. Teas. The above were a bright, excellent, well grown, and selected collection. Messrs. Cranston & Co., Limited, Hereford, were second, having good blooms of Mons. E. Y. Teas, La France, Marie Baumann, Marquise de Castellane, Etienne Levet, Marie Verdier, Suzanne Marie Rodocanachi, Ulrich Brunner, Her Majesty, and Catherine Mermet.

With eighteen Teas or Noisettes, three trusses of each, and twelve Teas, Mr. H. Merryweather was the only exhibitor, and was worthily awarded the first prizes. The collection included grand blooms of Souvenir d'Elise Vardon, Princess of Wales, Madame de Watteville, Madame Hoste (good), Luciole, The Bride, Marie Van Houtte, Madame Lambard (splendid), Souvenir de S. A. Prince (very good), Catherine Mermet, and Comtesse de Nadaillac. His twelve bloom stand contained Souvenir d'un Ami, Caroline Kuster, Catherine Mermet (fine), Innocente Pirola, The Bride (very good), Madame Willermoz, Madame A. Etienne, Francisca Krüger, Marie Van Houtte, Ernest Metz (good), Jean Ducher, and Madame Lambard (fine). Mr. Merryweather was also first with twelve single trusses of any white Rose, his stand being composed of Merveille de Lyon, some being in fine condition, others too far developed. For twelve single trusses of any crimson Rose, Messrs. Cranston and Co., Hereford, took first with fine blooms of A. K. Williams of varying quality. Messrs. Cranston also received an extra prize for a splendid box of twelve single trusses of Mrs. John Laing, the blooms being nearly equal in merit throughout and forming a very commendable exhibit.

In the amateurs' division the Rev. J. H. Pemberton, Haverling Romford, took the leading place in three classes, only meeting, however, with opposition in one. In the class for thirty-six, distinct, single trusses, Mr. Pemberton had a remarkably fine, fresh, richly coloured, and moderately even collection. The varieties staged were:—Back row: Etienne Levet (good), Eugénie Verdier, Comtesse Raimbaud (beautiful), François Michelin, Suzanne Marie Rodocanachi, Countess of Oxford, Earl of Dufferin (boldly built, but slightly disfigured), Ulrich Brunner, Sir Rowland Hill (grand), William Warden, Exposition de Brie, Madame Charles Crapelet. Middle row: Baroness Rothschild (grand, large bloom), Duchess of Bedford, Duchess of Albany, Madame Prosper Laugier, Horace Vernet (magnificent), Grandeur of Cheshunt, Marie Baumann (splendid), Barthélemy Joubert, Heinrich Schultheis, Countess of Rosebery (good), La France (excellent), Duke of Teck. Front row: Marshal P. Wilder, A. K. Williams, Rosieriste Jacobs, Queen of Queens, Camille Bernardin, Pride of Waltham (very good), Merveille de Lyon, Mrs. Charles Wood, Madame Victor Verdier (compact), Auguste Rigotard, Pride of Reigate, Dr. Andry. In the class for twelve distinct, three trusses, Mr. Pemberton was again the only competitor, and consequently took the leading position with an exceedingly good stand, showing a careful selection of varieties, including Prosper Laugier, Suzanne Marie Rodocanachi, Charles Lefebvre, Pride of Waltham, Beauty of Waltham (very good), Ulrich Brunner, La France, Madame Charles Crapelet (very good), Catherine Mermet, Marshal P. Wilder (fine), Merveille de Lyon, Prince Arthur (beautiful). In the class for twelve Teas or Noisettes Mr. Pemberton was again first with a beautiful stand of excellent blooms, including Madame Bravy, Ernest Metz (very good), The Bride, Belle de Bourdeau, Francisca Krüger (good), Souvenir d'un Ami, Bouquet d'Or, Catherine Mermet, Madame Lambard, Innocente Pirola, Comtesse de Nadaillac, Mrs. James Wilson. The second prize was secured by S. Barlow, Esq., J.P., Castleton, whose blooms were very good, especially Comtesse de Nadaillac, Madame Lambard, and Anna Ollivier.

In the class for twelve single trusses of any white Rose, Chas. Brown, Esq., Plumley, obtained first prize with a grand box of Merveille de Lyon, there being no second. In the class for twelve single trusses of any crimson Rose only one exhibitor staged, Chas. Burgess, Esq., Plumley, securing first with a superb even box of Marie Baumann, only one of which had developed too far. Some of them were exceedingly rich in colour. An extra prize was awarded the Rev. J. H. Pemberton for a splendid box of twelve single trusses of Mrs. John Laing, very regular in size, shape, and shade of colour, being equal, with one or two exceptions, to Messrs. Cranston's similar box.

In the section for district grown Roses, open only to residents within twenty miles of Manchester, the first class was for twenty-four distinct,

single trusses, in which Thos. Tatham, Esq., Wilmslow, was first with an exceedingly creditable collection. The varieties were:—Charles Lefebvre (fine), Captain Christy (good), Suzanne Marie Rodocanachi, Her Majesty, Caroline d'Arden, La France, Mons. E. Y. Teas (rich), Duchess of Bedford, Elie Morel, Dr. Andry, Eugénie Verdier, François Michelin, The Bride (neat and fresh), Ulrich Brunner, Viscountess Folkestone (very fine), Pride of Reigate, A. K. Williams (fine), Catherine Mermet, Louis Van Houtte, Madame Hoste (good), Alfred Colomb, Marie Baumann, Lady Mary Fitzwilliam, Mrs. John Laing. Chas. Burgess, Esq., Plumbley, was second with good examples, the best being Mrs. J. Laing, Her Majesty, Sir R. Hill, Pierre Notting, and Duchess of Bedford. Third, James Brown, Esq., Heaton Mersey, who had some excellent Tea Roses in his collection, including The Bride and Ethel Brownlow. There was also a fourth stand, which is mentioned to show that this class was one of the keenest contested in the Exhibition. Mr. Chas. Burgess, Plumbley, was placed first in the class for twelve distinct single trusses, Mrs. J. Laing being his best bloom, followed closely by Marie Baumann; the others were Her Majesty, Earl Dufferin, Francis Courtin, Countess of Rosebery, Merveille de Lyon, A. K. Williams, Marquise de Castellane, Rosieriste Jacobs, Anna Wood, and Pride of Waltham. Thos. Tatham, Esq., Wilmslow, was second; and A. Gladstone, Esq., Wilmslow, third. Mr. Chas. Burgess was again to the front in the class for six distinct single trusses, which included François Michelin, Earl Dufferin (really splendid bloom), Marie Baumann, Her Majesty (very full), Mrs. J. Laing, Lady H. Stewart, a small bloom but richly coloured. A. Gladstone, Esq., Wilmslow, was second with a good stand, though too much developed. Marie Baumann was the best bloom, and Captain Christy remarkable for its deeply coloured central petals. Thos. Tatham, Esq., was third.

In the nurserymen's class for bouquets of Roses Messrs. Perkins and Son, Coventry, were first. In the district class for a bouquet of Roses, Jas. Brown, Esq., Heaton Mersey, and Miss Lord, Oakleigh, Ashton-on-Mersey, were awarded equal firsts. Extra prizes in addition to those mentioned previously were awarded to Messrs. Dicksons, Limited, nurserymen, Chester, for a splendid collection of Roses and herbaceous flowers, and to Messrs. Laing & Mather, nurserymen, Kelso, N.B., who exhibited some splendid boxes of Malmaison Carnations, pink and blush; also Carnation Germania and a miscellaneous stand of some of the most useful garden varieties. Some beautiful boxes of Roses not for competition were shown by Messrs. Dickson and Robinson, 12, Old Millgate, Manchester, and by Dickson, Brown, and Tait. A collection of Sweet Peas, all beautiful named varieties of new and novel colours exhibited by Mr. Henry Eckford, Wem, Salop, was highly commended. Mr. N. Campbell, High Blantyre, was awarded an extra prize for a stand of seedling Pansies.

FRUIT FORCING.

Vines.—*Vines in Pots for Early Forcing.*—The Vines that are to be started in November should now have the wood thoroughly ripe and the buds plump. When that is not the case keep the house rather warmer by day, say at 80° to 85°, closing early so as to run up to 90° or 95°, and throw the house open at night—not suddenly, but after the heat has considerably declined. Supply water or liquid manure, so as to keep the leaves from flagging. Expose the foliage fully to light and air. Keep the laterals well in check, leaving no more than are absolutely necessary to appropriate any excess of nutriment, and so prevent the principal buds starting. When the wood is brown and hard and the buds are prominent they should be removed to a situation outdoors, standing them on slates or boards in front of a south wall or fence, securing the canes to the face of the wall. Only give water to prevent the foliage flagging and falling prematurely, and have some waterproof material at hand to throw over the pots when heavy rains prevail, as a saturated condition of the soil is not favourable to the preservation of the roots. In this position they will have some rest, even if the leaves are not actually shed. When the leaves turn yellow cut away the laterals close to the cane, and in a week or ten days, if the buds are not started at the upper part of the cane, shorten it back to the length required, and place the Vines in an airy, cool, dry place until required for forcing. Keep them dry at the roots, and yet not so dry as to cause them to shrink, but just moist enough to keep them fresh. They are best kept in a north house, where they are cool yet safe from frost. If frost has access some dry protective material should be placed about and over the pots to keep the roots intact.

Planted-out Vines Required to be Early Forced.—Vines that have not been started early will need, as soon as the crop is off, to be thoroughly cleansed by syringing and the application of an insecticide where red spider and thrips have obtained a footing, and if there is any doubt about the ripeness of the wood or the plumpness of the buds it will be necessary to keep the house rather close by day, but with sufficient ventilation to cause evaporation and allow the moisture to escape. Sufficient water must be given at the roots to prevent the

leaves becoming limp. It is also a good plan to cut back the growths to within three or four leaves of the pruning buds. This assists them to plump the latter, and there is no danger of their starting unless the Vines are unusually vigorous. If the weather is cold and moist employ fire heat in the daytime to maintain a temperature of 70° to 75° with moderate ventilation, and turn the heat off in the afternoon to allow the pipes to cool. Increase the ventilation at night so as to promote a thorough draught, and this will soon cause the wood to harden and the buds to plump, inducing rest, which for Vines that are to be started in December should be complete from the middle to the end of September, when the Vines must be pruned. With the wood thoroughly ripe ventilate fully day and night.

Earliest House.—The Vines will now require a dry atmosphere to thoroughly ripen the wood, but it will not be necessary to employ fire heat. All laterals and late growths must be kept stopped, and complete rest induced by having the border cool and moderately dry. Inside borders may require water, for they must not be allowed to become parched and cracked, but where they have been mulched it may not be necessary. Outside borders will be moist enough, and may need covering with dry litter or bracken in order to throw off heavy rains. This is essential to insure complete rest, which is so needful to Vines long subjected to early forcing, a too moist condition of the soil tending to late growth. But there must be sufficient moisture to maintain growth in the laterals in order to prevent the premature ripening of the foliage. In most cases it will be sufficient to allow a moderate extension of the laterals, and where the Vines are in an unsatisfactory condition prepare for lifting at an early date, getting fresh loam and clean drainage, so that the work can be done quickly when started. It is desirable to lift the roots and lay them in fresh soil nearer the surface whilst there is foliage upon the Vines, therefore work of this character ought not to be delayed beyond the close of the present month in the case of Vines that are to be started early in December, for they will need pruning by the middle of September, or in the case of lifted Vines a little later.

Second Early Houses.—The Vines will now be freed of their crops, and should have the foliage cleansed by means of the syringe or engine, and if necessary apply an insecticide. If there be any mealy bug or scale promptly use petroleum, a wineglassful to 4 gallons of water, keeping it well mixed whilst it is being applied, either by a few brisk squirts into the vessel and then alternate ones on the Vines and into the mixture, or by one person syringing into the vessel and another on to the Vines. This is imperative in using petroleum with clear water, and this is, provided the mixture is kept well agitated, much the best way to apply petroleum to Vines for the destruction of mealy bug and scale, as it does not, like petroleum emulsions, leave a deposit on the glass, which is difficult to wash off, and if allowed to remain deprives the Vines of a large amount of light. But the emulsions are more likely to insure an equal distribution of the petroleum, and we have found the following much easier of application than water and petroleum. Dissolve 8 ozs. of softsoap and 1 oz. of washing soda in 4 gallons of boiling water, add to it one-third of a gill of petroleum, and churn with an ordinary garden engine by pumping it into the vessel two or three minutes, and then it may be syringed over the Vines, the temperature of the mixture not exceeding 100°. Or keep the mixture thoroughly agitated by stirring briskly with a broom handle whilst being applied to the Vines, which must be done thoroughly, wetting every part. It is best done on a dull, calm afternoon, and should be repeated two or three times at intervals of a few days. If there be any plants they must be removed, and if the roots of the Vines are near the surface cover the border with dry short material to absorb the waste. This mixture will destroy red spider and thrips as well as mealy bug and scale. Keep the laterals fairly in hand, not closely pinched, unless the Vines are very vigorous and are not ripening the wood well, when keeping the house fully ventilated at night, and somewhat warm and close by day, will tend to the maturity of the wood and buds. In stopping vigorous Vines regard must be had to the principal or pruning buds, not stopping so close as to jeopardise their starting into growth through an excess of sap. Such Vines should also be kept without water until the young leaves are becoming a little limp, but it must not be withheld to the extent of affecting the main leaves. Vines, on the other hand, that have been enfeebled by continued cropping and early forcing or any other cause, should be encouraged to make growth by applying liquid manure to the border; but whatever extraneous foliage is made must not be allowed to interfere with the principal leaves by depriving them of light and air, for these must be kept clean and healthy, so that they may appropriate some of the extra food, and store it in the adjacent wood as well as aid the buds to plump.

THE KITCHEN GARDEN.

Mushrooms.—After a period of dry and moderately warm weather, this favouring a good spread of mycelium, a soaking rain followed by dull days has the effect of bringing up Mushrooms freely in the meadows. They are, or have been, very plentiful recently; but it frequently happens that when we get them thus early in the season there are few or none in the autumn. There is all the more reason, therefore, to form early beds, and in any case there is not much likelihood of there being too many Mushrooms in most places. A bed spawned during the first fortnight in August should commence bearing late in September, and continue to be profitable for several weeks. If house room proper is somewhat limited the earliest beds may well be formed wholly outside or in any moderately snug shed, reserving the space in the Mushroom house for the later beds, as the latter will most probably require some assistance in the shape of fire heat.

Preparing the Manure.—Nothing but horse droppings and a little very short straw should be used for flat beds, and these ought to be saved from horses fed on corn and other dry food only. These droppings should not be mixed with the straw, and all allowed to heat strongly before being separated, as this may spoil the manure by over-heating. Keep them apart as much as possible, and protect from heavy rains. When enough has been saved to form a good sized bed throw all up into a heap to ferment, very gently watering if at all dry. Directly the centre of the heap has become hot, and before it attains a white heat, turn it inside out, again watering if too dry to ferment properly. Repeat this treatment every other day till a fortnight has expired, taking care to ward off rains with either a heavy covering of litter, pit lights, or tarpaulin. Thus treated the manure will not have lost all its vitality, but only got rid of impurities. Decay must still go on after it is made into a bed, otherwise there will be no heat generated, and no suitable rooting medium for the Mushrooms.

Forming the Beds.—The beds may be of any length or width, but if much more than 4 feet across they are very awkward to get at. Form them in layers, thoroughly shaking out the manure, and separating any large flakes as the work goes on, also making it solid either by trampling or beating with the back of a fork, eventually leaving it about 14 inches deep at the back and 12 inches at the front. Plunge two or three trial stakes into the beds and frequently examine them. At first the heat should rise considerably, and not till it has declined to about 85°, this being when the trial stakes can, when drawn out, be borne comfortably in the palm of the hand should spawning take place. In anticipation of this good fresh spawn should be obtained from a reliable source, breaking each brick into about eight or ten pieces. Open shallow holes with the hand, and not a dibber, the latter making holes too deep, and in which steam may collect to an injurious extent. These holes may be about 8 inches apart and angled, the lumps of spawn being pressed in flatly and only slightly below the surface, the bed being then smoothed over and the spawn further fixed by means of a beating with the back of a spade. Return the trial stakes to the bed, and if the heat give no signs of rising again soil over in about three days, otherwise delay doing so for a week or longer or harm may result. Fine virgin loam, or such as separates from the potting turf, is the best that can be used for soiling Mushroom beds, and failing this substitute the best fresh soil procurable, that obtained from immediately below the first spit of loamy garden ground that has not recently been trenched answering well, an even thickness of 2 inches of soil is recommended. Should soiling over unduly raise the heat in the bed open a few deep holes and let out the steam. Directly the heat declines considerably mulch the bed freely with strawy litter, this conserving heat and moisture.

Open-Air Beds.—The present is a good time to start with these, and if properly managed they will produce heavier crops of better Mushrooms than any under cover. They must be ridge-shaped, and should be formed, if possible, where the coldest winds do not reach them, though a very hot site is not desirable. Also locate them where water does not accumulate, and where neither moles nor field mice have ready access, both being liable to upset the Mushroom grower's calculations. For these ridge-shaped beds horse droppings alone will not do. At least one-third of the bulk of manure used should consist of short stained straw, and that quantity is very frequently exceeded with advantage. Extra pains must also be taken on the lines already laid down in preparing the manure, ridge-shaped beds being more liable to become violently hot than those of much less depth. A bed may be of any length, but should not exceed a width and height of 3 feet, 6 inches less each way being the orthodox measurement. It should be duly staked out and built up in layers very solidly and neatly, being gradually narrowed so as to leave the top about 6 inches across. Give a gentle slope to the ends as well as the sides, as these have to be spawned, and comb all down, leaving the straw most exposed, this throwing off a moderate amount of rainfall. Insert trial sticks, examine, and otherwise treat as in the case of flat beds, the spawning being carried out in a very similar manner all over the bed other than immediately on the top, as the mycelium will reach that part fast enough. Guard against casing over too quickly, as this may cause a dangerous rise in the heat, and necessitate forming deep holes with an iron rod at short intervals down through the centre of the bed. Use moist soil of the character previously advised, and to the same thickness, but do not water and plaster it over, or injurious cracking is inevitable. When safe cover heavily with long straw litter, arranging this so as to throw off excessive rainfall.

Spawning Melon and Cucumber Beds.—When Melons in pits and frames are nearing their ripening period, not much more water being needed by the plants, lumps of Mushroom spawn may be inserted, not necessarily in the manure, with every prospect of abundance of Mushrooms being had later on. When the plants are cleared out, mulch the bed with strawy litter, and unless very dry there will be no necessity to water the beds, heavy rains being kept off by means of the lights. Cucumber beds may be similarly treated later on, or say by the end of August. All the sides, when ordinary frames are placed on hotbeds generally, should also be spawned at once, and cased over with soil as advised in the case of ridge-shaped beds, and further covered with strawy litter, Mushrooms being produced in abundance six weeks hence. Even raised Vegetable Marrow heaps should be spawned, these sometimes yielding heavy crops of Mushrooms both before and after the collapse of the Marrows. In this instance nothing beyond inserting lumps of spawn is necessary to insure success.

THE BEE-KEEPER.

APIARIAN NOTES.

THE WEATHER.

WE had two hours of really summer weather on the 17th, very changeable and fluctuating temperature on the 18th, and on the 19th another severe storm of wind and rain. The barometer rose on that night from 29.10 to 29.90, and we have at last been getting more summer-like weather, although still changeable.

SWARMING.

On the 14th, a stock of bees having one hatched queen and two queen cells in a tumbler on the top of the hive separated by perforated "excluder" swarmed, and was returned. It swarmed again on the 15th. The swarm was hived, but the appearance of several bees leaving the hive quickly gave evidence that there was no queen. I then removed the tumbler containing the two cells from the stock and placed it over the swarm in their new hive which settled them. On the 17th one of the queens was evidently hatched, as it (the swarm) swarmed again, but intercepting the queen with a few bees, and removing the other queen in the act of creeping out of the cell, put a stop to it. This was about midday, and the temperature was so chilly that the greater bulk of the bees lay benumbed for about twenty minutes, when the weather became warmer, and by two o'clock the temperature had risen to 68°, and thus the bees were enabled to gather a little honey. By four o'clock the temperature was again at 50°. This case proves that neither timely space nor excluders will prevent swarming.

PURITY OF BEES.

I have for a considerable time past drawn the attention of your readers to the impurity of some of the variety of bees sent to this country, as well as what the Americans sell, which do not resemble pure breeds.

I had a visit lately from J. D. Boswell, Esq., 9, Morning-side, Edinburgh, a lover of bees, naturalist and botanist to boot. He has travelled over the continent, and visited the Italian Alps, the home of the Italian Alp bee; and also Lower Italy, where, he says, the insect is not pure, thus corroborating Herman's statement and my own opinion. He also informed me that he gathered a rare Fern in Austria, that he had never seen described in any work nor observed in any collection.

PUNICS.

Although the weather is still unfavourable for testing the superiority of different varieties of bees, it would occupy too much space to defer all I have to say till the end of the season, so will give my experience from time to time. In every case, and with all people who have given them a trial, the Punics are mild tempered, and do not propolise more than some other varieties. With the exception of crossed Syrians they have as much stored honey as others, entering their supers readily, and do not swarm till their hive is filled and crowded. I have sometimes thought they were more tender than Carniolans, but harder than Italians, Cyprians, and Syrians. Doubtless they raise a great number of queens; as many as fifty to 200 may be found in a hive at one time—a feature I do not like. One pure stock hive I examined a month previous to swarming had upwards of 200 royal cells, and I do not know how long this had been going on, as I saw one only thrown out, but since I have observed about six. From the appearance of this hive no less than 1000 queen cells must have been raised and then destroyed, because piping only began after a month's work of this kind had been going on, and I am inclined to think the old queen only issued with the swarm—a good feature certainly, but I will make sure and let you know.—A LANARKSHIRE BEE KEEPER.

SENDING BEES BY POST.

THE Editors of another journal state that they "are in a position to say that there is no truth whatever" in what I say on June 23rd, but, as usual, they do not give any evidence to support their assertion, and try to claim what is due to me for Mr. Cowan.

If these Editors are able to publish a copy of the complaint sent to the Postmaster General, calling his attention to the fact that I was in the habit of sending bees by post, and asking for the law to be enforced, and give their proofs for what they now say, I will then publish what I told the P.M.G., which led to a sharp look out for packages of bees coming from North Africa as the mails reached this country, and which may be somewhat interesting.

It is stated that "all the concessions hitherto obtained have been through the initiative of the B.B.K.A., who appointed a deputation, of whom Mr. Cowan was one, to wait upon the postal authorities." The last "deputation," from what I can learn, consisted of the Secretary of the B.B.K.A.—the late Rev. H. R. Peel—and Mr. Cowan, who waited on Mr. Blackwood, Sec. of the G.P.O. on Aug. 11th, 1881—eleven years ago. The answer they got was a "regret" that the P.M.G. was "unable to comply with the wishes of the Association." Particulars of this will be found in *B.B.J.* for Oct. 1st, 1881, page 113.

Allow me to inform these very energetic Editors that everything of value connected with sending hives by post has always been obtained through my "initiative." It was entirely through my observations, suggestions, and discoveries, and my agreeing to pay Mr. Benton half price on dead queens and full price on live ones, that mailing queens long distances was eventually made a success. It was I who told Mr. Benton how to send his queens, and it will not make the least difference to me if the law is never altered, as all my queens go by letter post, openly, with my name and address on the packages. What I wanted was to make it so that everyone can do what I am doing. If this fact had been used as a lever to show the anomaly of the law an effective step would have been taken, instead of which it was represented to the Post Office that sending bees by post was against the interests of bee-keepers; at least this was what the Post Office authorities understood, and why they took steps to stop me sending them.

These well-posted Editors say I have got no concession for bee-keepers "other than that which has been enjoyed by them since the Inland and Foreign Parcel Post was established." If this is so I challenge them to point out either in their own journals or the Postal Guide the slightest intimation that live bees can be sent by Parcel Post. The law says "living creatures" shall not be carried by post, either as "parcels" or anything else. The July Postal Guide does not, I see, except live bees, and I shall write to ask why the exception to live bees is not published in the Postal Guide, so as to ensure its going in next time.

If these Editors can show their party have made any movement for eleven years, or obtained any concessions, or made any public, they have now a fine chance to confound me; if they do not do so, readers can form their own conclusions as to "who, from interested motives, endeavour to make black appear white."—JOHN HEWITT, *Cambridge Street, Sheffield.*

OLD IDEAS AND NEW NOTIONS.

I SHOULD like to shake hands and have a chat with "Lanarkshire Bee-keeper." He has mentioned my name several times in your paper. I am sorry if I have caused any soreness with respect to my plan of fixing wax in bar frames. I am fully aware many so-called new ideas have been in the hands of veterans of the craft, but at the same time it is a pity they should remain there, and if the credit falls on the wrong party the public get the benefit. Your paper is read by many interested in bee-keeping, and I hope if our friend has any more bottled up novelties he will out with them, and so save some enthusiast like myself from obtaining honours that have been long since known. I suppose our friend will not find fault with my new ideas in extractors, feeders, &c.—W. P. MEADOWS.

* * * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Seedling Strawberry (*G. McD.*).—Your seedling from President appears to be a good variety, the flavour being superior to the type; but to cram the fruits one on the top of the other in a small tin is not the

way to insure their arriving in the best condition for an opinion to be formed of them. You might send a few more carefully packed.

Stunted Cauliflowers (*J. C.*).—There is nothing to satisfactorily indicate the origin of the check. It is wholly local, and the Cauliflowers would have developed under favourable cultural conditions. Poor soil, grubs, or noxious matter, or some check in the preparation of the plants may have arrested their growth. We have no particulars to guide us in arriving at a definite conclusion on the matter.

Mildew on Tomatoes (*X. Y. Z.*).—There is nothing the matter with the individual leaf to cause you any concern, but the pair are infested with mildew. All such leaves should be cut off and burned, and the remainder may be dusted with sulphur. Are you not keeping the house too close and moist? You do not say whether it is heated or not; if it is coat the pipes with sulphur, the fumes of which are obnoxious to the small fly of which you complain, and have a tendency to check the growth of mildew.

Grubs in Rose Twigs (*F. F. G., Howick*).—The trees are infested by the grubs or larvæ of one of the saw-fly group, probably that of *Pœcilosoma candidatum*, a black and white fly of small size. These appear about April, and deposit eggs upon the shoots, into which the young larvæ at once burrow, and remain hidden till mature, which event happens during July, when they descend to the earth, where they winter. Hence it has been advised to remove the surface soil on the ground where they have been noticed to occur, or apply quicklime in dry weather, which destroys them. While they are in the twigs nothing can be done beyond removing all infected.

House for Carnations (*St. Julien*).—The structure is more suitable for growing Carnations in than a light span-roof with brickwork up to a little above the stages, and glazed sides about 18 inches high from the brickwork up to the eaves. If the house is narrow, flat side stages, also a stage across one end will suffice, but large houses have a central stage as well. You appear, however, to desire a small house, and only wish to know the height. The heights of houses are governed by their width. An amateur we know grows Carnations very well in a house 9 feet wide and 8 feet high to the ridge, the ends standing north and south. Ample provision must be made for ventilation, both in the sides and roof of the house. Houses 30 feet long are sometimes heated with gas. We prefer the burners under the boiler outside the house.

Fungus on Tomato Leaves (*G. M.*).—The description you give of the fungus does not accord with *Cladosporium*, but the white spots under the leaves that turn to a dark brown agree better with the Potato fungus (*Phytophthora infestans*). Had you sent a few leaves for our inspection we should have been able to have given more explicit information. You may, however, spray the plants, but not the fruit advanced in swelling, with ammoniacal carbonate of copper solution made by mixing thoroughly 3 ozs. of pulverised ammonia carbonate and half ounce of copper carbonate (precipitated), and keep in an air-tight vessel, and when wanted for use dissolve in 10 gallons of water. The solution must only be used so as to coat the foliage with a thin film, and both surfaces of the leaves must be dressed. A syringe with a spraying nozzle will do this effectually.

Tomatoes Failing (*W. H.*).—We have seen very good crops grown in such positions as you describe. The boxes are quite large enough. We suspect you have erred in allowing too much lateral growth. Most of the best growers allow none at all. They grow the plants sturdily from the first, confine each to one stem from which flower trusses issue, and pinch out all axillary growths when they are 1 inch long. In that way they have "ropes of fruit." Overwatering in the early stages, overcrowding of the growths, and an insufficiency of air are dangers to be avoided in growing Tomatoes. They also like firm soil, and only sufficient water for sustaining free growth. No one can suggest the quantity, as that must be governed by the condition of the plants and state of the weather. You would find Mr. Iggulden's work useful, post free from this office 1s. 2d.

Destroying Woodlice (*J. W., Leeds*).—If you expect to destroy all the woodlice in a night by any action whatever we are bound to say you will be disappointed. The plan we mentioned has answered admirably when properly carried out. We, however, add that toads and pieces of cut Potato are excellent means of destroying woodlice, but where they "swarm" more wholesale means must be employed. Woodlice most frequent leaves, tan, old boards, and other decaying organic matter, secreting themselves in any cracks of the soil, by walls, or anywhere in moist places, and near their food plants. These habits have been taken advantage of for their destruction. The old-fashioned trap of boiled Potato wrapped loosely in a little hay, and placed in a small flower-pot laid on its side in their haunts captures a good many, the baits being examined every morning, and the woodlice shaken out into boiling water. Placing a little hay by the side of the walls upon the beds or borders, sprinkling over it a little scalded oatmeal or bits of boiled Potato, and over these scattering some hay entices the woodlice, and pouring boiling water on the hay through a rose watering can in the morning soon destroys the insects. If the water is not used in greater quantity than to wet the hay no damage is done to Mushrooms. Old tan serves equally well if placed on a narrow board at the side of the bed near the wall, especially when mixed with a little boiled Potato, bread crumbs, scalded oatmeal, or pieces of raw Potato, Carrot, Beet, or Mangold Wurtzel, baiting for a few days to attract the woodlice, and then scald them with boiling water. Mr. Charles Bateson, writing in answer to a question about destroying insects in Mushroom beds, observes:—"If sugar and plaster of Paris are mixed together in any proportion, strewn about an inch thick all round and on the top of the

bed, the insects will speedily disappear; at least I have found this simple mode efficient. They eat it for the sake of the sugar, and I suppose the plaster of Paris must harden in their stomachs, and so kill them."

Fig Leaves Diseased (J. B.).—The leaves are attacked by a minute fungus, a species of *Glæosporium*, which is much milder in action on the leaves than on the fruit, and causes the foliage to have a rusted appearance, completely arresting the growth and crippling the trees. We can only advise the spraying of the infested trees with ammoniacal solution of copper carbonate, which may be made by mixing 3 ozs. of pulverised ammonia carbonate and half an ounce of copper carbonate, keeping them in an air-tight bottle, and dissolving in 5 gallons of water for use. It must only be used as a spray, and not over fruit, which cannot be freed of the copper before it is ripe. Then burn all the leaves as they fall, thoroughly cleanse the house, and dress the trees thoroughly with a solution of sulphate of iron in water. A 10 to 15 per cent. solution is used on the Continent for Vines, but the weaker solution is quite strong enough for Fig trees. It is best to try the effect on a few growths, which will show indications of damage in a few days if injured, when it may be diluted if necessary, as Fig growths vary considerably in the maturity of the wood. The surface soil also should be removed, so as to prevent infection.

Crossed Cacti Fruiting (S. B.).—The fruit now about the size of a hen's egg will mature this season, but it is best to allow it to become shrivelled and dry, as it will be by spring, when the seed may be rubbed out and sown in a pot or pan filled with very sandy soil, surfaced with sharp white sand, and placed in a partially shaded position until germination commences, when the plants may be exposed, and very carefully watered. Usually plenty of plants spring up, and when they become large enough to handle, six or seven may be placed in a 5 or 6-inch pot and allowed to stand one year, after that time they will be ready to remove singly into 3-inch pots. We should say it would be very interesting to an amateur to raise Cacti from seed of crossed varieties, quite apart from the prospect of obtaining something new and good, but it is a very slow method, therefore little practised. These plants are becoming more popular, and certainly are deserving of more attention than has been accorded to them in recent years.

Heating Forcing Houses (A. G.).—It is somewhat wasteful of fuel to use a large boiler for heating a smaller quantity of piping than it is intended for, but by careful stoking the waste may be considerably minimised. With so large an extent of glass it would hardly be desirable, and certainly not safe, to rely on one boiler. You ought to have a duplicate, so that there would not be any serious loss in case of an accident. Therefore, you may find it more economical to have a boiler large enough to heat the first lot of houses, and defer having the duplicate until the other houses are erected. The Cornish boiler, that is the Trentham Cornish boiler, is much in use, and answers very well. The Thames Bank and other forms of horizontal tubular boilers are not more wasteful of fuel than the upright tubular boilers, for the principle is to place the water in the furnace, just as the blacksmith thrusts the iron into the fire, and abstract as much heat out of the furnace or fuel as possible. The saddle boilers are excellent, especially those with terminal ends and hollow grate bars. All, however, are now so much improved that it is difficult to decide as to which is the best form of boiler. You cannot err in having the most approved of any of those mentioned.

Planting and Repotting Roses (A. S.).—The *Maréchal Niels* to which you allude are, we presume, established in pots. When these are fairly filled with roots planting may be done without removing the soil, except rubbing a little off the top and remove drainage to slightly liberate the roots. Take care that the soil is neither dry on the one hand nor soddened with wet on the other when the planting is done, and the new soil should be pressed firmly round the roots. Turfy loam, inclining to be heavy, with a sixth part of sweet decayed manure intermixed, adding a shovelful of wood ashes to a barrowful, will form a suitable compost. Mulch the surface of the soil after planting with partially decayed manure. Fresh soil may be given to Roses in pots now, removing a portion of the old and inert, and to liberate some of the roots, and bring them in contact with the new compost. Stand the pots on ashes in a shaded place outdoors for a time, but not under trees, and syringe as often as may be needed to prevent the leaves flagging. This is better than saturating the soil. Overwatering after repotting is an evil not always avoided, and so is placing the pots in needlessly large pots. Coarse sand may be added to the compost for potting, also about a seventh part of leaf soil for Tea Roses.

Grapes Eaten by Grubs (H. D.).—The Grapes are gnawed and partly eaten by the larvæ of the Apricot Moth (*Portrix angustiorana*). The pest lives on other fruit trees, indeed on most, on Privet, Hawthorn, and other shrubs, and of late years has been found on Grapes, as in your case. The larvæ are most partial to the Apricot and Pear and appear during May and June. They are half to three-quarter inch long, yellowish green with brownish head, and a few hairs scattered over the body. It is a very active creature, wriggling about in various distortions when disturbed, crawling backwards or forwards with equal facility, and lets itself down by a fine thread from its mouth. On Grapes, the caterpillars gnaw the skin and eat part of the pulp, and fasten them together by a web. The attacked berries decay and cause the decay of others in contact. The grub becomes nearly an inch long when full fed on Grapes. It attains this condition by the time the Grapes are ripe, and is not generally noticed until that time because its infestations on Grapes are only occasional, but it seems to be largely on the increase in this respect, and is very destructive. They are easily detected and

when disturbed they quit their quarters, but less quickly on Vines than on fruit trees, and let themselves down by a small thread, and are readily captured. Close observation and hand-picking are, therefore, the best remedies. The moth is from half-inch to three-quarter inch in expanse of forewings, which are ochreous in the males and reddish-brown in the females, with a darker patch at the base, a chestnut brown patch slanting from the middle of the wing to the hinder angle, and darker spots irregularly scattered over the outer half of the wing with a triangular spot on the front border. They appear in early summer and are very fond of light, indeed they are destroyed in fires on the Continent and in vessels of water.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (J. B.).—*Zephyranthes carinata*. (Somerset).—It looks very much like the Goldilocks, *Chrysocoma linoxyris*, but the specimen is not a good one, and we cannot speak with certainty.

COVENT GARDEN MARKET.—JULY 27TH.

HEAVY supplies now to hand of sieve fruit, realising fair prices.

FRUIT.

DAIRY COWS.

CAREFUL consideration of ways and means for the possible improvement of agriculture gives rise to the question, Have special efforts for the improvement of certain breeds of cows

been wisely directed in view of future contingencies? Regarded broadly, so as to take in the bearing of foreign influences, the answer is decidedly unfavourable. The Shorthorn craze had only the production of beef for its end and aim; the Herefords only yield enough milk to rear their calves; the same may be said of the Sussex; Red Polls do better, coming much nearer the farmer's ideal cow in a profitable milk yield and the property of fattening easily, and it is only in "butter breeds" like Jerseys that breeding for milk has had the attention it deserves. The error appears to be the sacrifice of milk for beef. In milk we have practically a monopoly, in beef we have a brisk foreign competition, growing in magnitude yearly. The production of milk does not keep pace with growth of population, nor are there visible signs of efforts to effect improvement where it is so possible.

Authorities have from time to time published averages for the United Kingdom. Taking four of these, the average works out at an annual yield per cow of about 363 gallons. Another more recent statement places it at 400 gallons. If we take the lacteal period at 40 weeks—a low estimate—we have at the 400 gallons average only 10 gallons per week; or add to 400 gallons 150 more for consumption by the calf, or a total average yield of 550 gallons, and we have then in round numbers a weekly yield of only 14 gallons, or 8 quarts per diem. Now, we have cows which yield fully twice that quantity, so that the range of possible yield is very wide indeed. The possibility of improvement is proportionately great—the probability doubtful in about the same ratio. We have in these figures avoided niceties of decimal calculation, it being sufficient for our purpose thus to state the case broadly. Averages of special dairies have been given in former articles on this subject, but as bearing usefully upon it mention may now be made of Professor Sheldon's herd of Shorthorns' yield of 750 gallons; of the Duke of Westminster's herds on the Eaton Hall estate, with an average closely approaching this; of equally high average of the Munster Dairy School Shorthorns and cross-bred Ayrshires; of a still more remarkable average of 804 gallons of the Monewden Red Polls in Suffolk; and of the yield of an average of 600 gallons by a herd of Jerseys at Erleigh Court in Berkshire.

Surely such facts ought to act as an incentive to exertion, for if dairy farmers are fairly prosperous under the low general average, the higher possible one points to positive affluence. The well bred, carefully selected, deep milker requires no more food—certainly no greater care—than the mongrel inferior animal ought to have; the only difficulty is to obtain it. How this is to be done is sufficiently obvious—just steady persistence in breeding and selection—and remember the male parent must come from a family of deep milkers equally with the female. Cross-breed as much as you please, but do it judiciously and of set purpose, then success is a certainty sooner or later. Aim high, for general improvement in quality and quantity are both certain to reward persistent effort. It must be persistent, taking the inevitable failures very much as a matter of course; keeping in view a certain standard of, say, 700 or 800 gallons as a minimum average nett annual milk yield per cow. There need be no interference with business routine in doing this. The dairy work may go steadily on, herd numbers being well sustained, and as the head of deep milkers increases profits will grow too, so that means will be available for obtaining more heifers from other herds.

Quality is unlikely to receive much attention from those who produce milk solely for immediate sale. Plenty of milk is all they care for when it is sold by measure only, but when consigned to a butter factory, and sold under systematic testing for quality, then richness in cream tells to a much greater extent than is generally supposed. There is much difference of opinion as to richness of milk, some well-known dairy farmers giving 30 pints as the correct quantity required to yield a pound of butter, others lesser quantities downwards to 20 pints, yet we have it on high authority that 16 pints of Jersey milk of average quality, set and churned in an ordinary manner, will produce 1 lb. of butter. It must not be forgotten that careful breeding conjointly with judicious feeding and the use of a good separator, all tell upon the final result.

It is certain that much cream is wasted through bad management, such as churning unripe cream, or that which has been mixed carelessly—newly skimmed with that which has been skimmed for a day or two, or cream that has been badly separated. No doubt success in this as in other things depends very much upon a capacity for taking trouble, or in other words close attention to detail, as well as to breeding. The man who does one of these is precisely he who is most likely to do the other. That he will be richly rewarded is a certainty, because his possibilities are so great in increased production as well as in a ready market.

WORK ON THE HOME FARM.

Never have we known a more favourable season for all root and green crops, seed germination and plant growth being equally quick and vigorous. The transplantation of Cabbage and Thousand-headed Kale has also gone well, with plenty of rain to establish and set the plants growing freely; with sturdy plants and a rich soil success is then assured. Keep the soil well stirred between the rows, it keeps down weeds and keeps out drought. Do all you can to have an abundant supply of Kale for use next winter and spring, its value then is incalculable; it is such a boon when pastures become bare; and

"When winter lingers in the lap of spring,"

as it so often does, a few acres of Kale enable one to keep sheep off the grass, to keep cows in the yard, to freshen up the milk yield, and to wait for the grass till it is really sufficiently forward for useful grazing. Let it not be thought that we lay undue stress upon this crop or its influence upon the management of stock in winter and spring. Kale, though a most useful crop, is after all but a means to an end, and is just one of several things to bear in mind now. Where roots were sown early they appear to answer best this season; the later sowings—especially of Turnips—failed so much that we have seen several fields where seed has been drilled a second time in places. Though there has been much wet weather weeds have been kept under much better than was possible last summer. Charlock has made its appearance in several cornfields in small numbers, just in the usual way; every plant has been pulled up as soon as the flowers became visible. This is the only way to keep down this pest. Once leave it to ripen seed and it is almost impossible to get rid of it. That is how it has practically taken possession of the land on so many farms; a few plants the first year, thousands the second year, any conceivable number afterwards. The seed ripens, falls upon the surface, is ploughed in; any near the surface germinates, but so much is buried that every time subsequently the soil is stirred by plough, harrow, or cultivator, enough seed is brought to the surface for a full crop, so that the expense incurred in persistent efforts to eradicate it is positively ruinous.

As men could be spared weeds on the headlands and ditch-sides of cornfields have been cut down before seeding was possible. We have reduced the nuisance of such weeds to a minimum by a thorough clearance of ridges formed of an accumulation of ditch scourings for many years. These were carted to clay fires and burnt, since then the soil has been cultivated so near to the edges of the ditches as to leave space only for a narrow path; headlands are well worked and sown, far better is thus to grown corn than weeds, and to make neatness and profit to go hand in hand.

REMARKS.

- 17th.—Almost incessant rain till 3 P.M.; gloomy and damp after; very cold day.
18th.—Sunny early, generally cloudy after 11; overcast afternoon; rain from 5 P.M. to 7.30 P.M.
19th.—Sunny early, fair morning, S.W. gale, with continuous heavy rain from 0.30 P.M. to 4.30 P.M., and occasional torrential rains after.
20th.—High wind, and occasional gleams of sun and spots of rain in morning; frequent sunshine in afternoon.
21st.—Cloudy early, bright sunshine from 11 A.M., cloudy again in evening.
22nd.—Sunny, but rather hazy.
23rd.—Bright and warm, hazy at times.

In spite of the very low maximum of Sunday, 17th, one of the most uniformly cold days in July on record, the mean for the week is not notably below the average.
—G. J. SYMONS.

VARIOUS are the ways in which people spend what is known as their holiday. This must of necessity be so, having regard to the differing tastes of the multitude which compose the workaday world. Thousands of persons in London escape to the country when the day comes that permits their doing so ; while, on the other hand, many in the country flock to the metropolis to see the various sights that are provided for them, and bringing in shillings to the providers. Some persons, perhaps the majority, are bent wholly on deriving pleasure during their occasional respite from toil, while others seek to combine with it instruction. Without in the least reflecting on the purely pleasure-seekers so long as what they desire is wholesome and healthy, I have to class myself on the present occasion in the other category—those whose object during a day or two's relaxation is to blend instruction with enjoyment. Being an item in the great and, it is hoped, ever-growing community that delight in gardens and gardening, I found myself in London on the Saturday prior to Bank Holiday wondering where to go for satisfying my aspirations. "Oh," said a good friend who was appealed to for advice, "go to Chiswick ; as a Fellow of the Royal Horticultural Society you have the right of entrance, and there is always something worth seeing there that a mind on the alert may grasp and store, possibly to advantage." "But when shall I go, and how shall I get there?" was the responsive inquiry. Promptly came the reply, "Go now, from any of the stations on the District Underground Railway, say the Temple or Charing Cross, to Acton Green, and you will be within five minutes' walk of the gardens." The advice was taken, and I found myself at Chiswick.

Some years had elapsed since I had paid a visit to the gardens. I had the famous pyramid Pear trees in my mind, and the noble vinery. These I found there still, much in the same condition, but though the trees were nearly pearless, there was plenty of fruit on the Vines trained up the lofty curvilinear roof. How well the old Vines wear and bear. This is due, no doubt, to the practice that appears to be followed of training up young canes periodically and removing the old as the laterals become weak, not overcrowding the foliage, and affording nourishment to the roots by mulching the border with manure. Under such practice, with roof room for extension, and the soil of good staple, there is no knowing how long Vines, judiciously managed, will continue satisfactorily productive. In another long and narrow structure in the gardens, Vines much less young are not correspondingly fruitful, due, probably, in a very large measure, to the compulsory restriction to which they are subjected, and it is a pity the cramped tunnel-like case was not widened years ago. It struck me as an absurdity, though it may savour of presumption to suggest that the Council of the Society should permit anything to exist to which that epithet could be reasonably applied. If the stupid "case" had been ennobled into a roomy "house," the increased quantity of Grapes would have defrayed the cost of the addition in a very few years. Perhaps, however, the authorities know this, but as Mr. Barron was not present I could not appeal to him on the subject. I can only express the belief that the Vines are being ruined by restriction—at least, that is the lesson they taught me. Is it the lesson they are intended to teach others who may visit the gardens for instruction?

A large and lofty span-roof house appears as if it would some day be filled with Muscat Grapes, and good ones, judging by the growth of the Vines. But what a trial it would be to some of our young gardeners if they had to establish Muscat Vines in a forest of Tomatoes, yet that is what is being done at Chiswick. For vigour of growth and size of fruit these Tomatoes have surely seldom been excelled, still the Vines have forced their way out of and above them, and are making splendid canes, a few at the ends of the house, which have been allowed to bear, carrying splendid crops of fruit. This dual culture of Tomatoes in fullest vigour and Vines of greatest promise would be regarded as somewhat of a triumph by many ; but Mr. Barron, I am told, is never elated, and let us hope he is seldom depressed. Whether he likes it or not, a tribute must be paid to the great cultural aptitude that is displayed in this not common but successful combination.

"Figs are a feature of Chiswick." So said my London adviser, and I found he was right. In a fine, roomy, light house, built, I was told, by Messrs. J. Weeks & Co., and evidently well adapted for its purpose, is such a collection of Figs in pots that surpassed all my expectations. For variety, health, and productiveness I suspect it would be difficult to find their equal anywhere. The bushes, in various sizes, are studded with fruit. There are thousands upon thousands ripe, swelling, and forming, the trees being evidently master of their work, and the manager master of the trees. It is a veritable museum of Figs, which even a Royal Society may be proud to own, and if I had seen nothing else at Chiswick I should have been more than satisfied with my visit to the gardens. But there was a good deal more to admire—a breadth of dwarf Apples laden with fruit, another plantation of young trees on different stocks, collections of various flowers embracing the latest varieties too numerous to even enumerate, and a line of Cannell's Seedling Lobelia, the most perfect in its compactness and rich blue colour that I have been privileged to see in not a short nor shortly travelled gardening career. Such is the beginning of my holiday, which was distinctly enjoyable and instructive.

The Chiswick view ended, and my gratification described in the evening to my friendly guide, where to go next became the subject for discussion. It was eventually decided that as I had seen cramped Vines I should see what Vines can do which have their freedom, and a Sunday evening's stroll was arranged in the direction of Roehampton. This quiet and picturesque village seems to nestle in a hollow on the verge of Wimbledon Common. It is just far enough from a railway station for preserving its rural character, and is both peaceful and prosperous. Some seven or eight millionaires are said to reside within its borders, and there is always work to be had for all respectable men, those who work in gardens receiving from 20s. to 25s. a week. Near the centre of this village is Manresa House, formerly the seat of the Earls of Bessborough, but now a Roman Catholic College. In the gardens is the celebrated Vine that I had more than once read about in the *Journal of Horticulture*, and often wished to see. At last my hopes were to be realised. We were fortunate in finding Mr. M. Davis, the gardener, at home. He is a bright, intelligent, genial Irishman. It is a real pleasure to meet such a man, truly one of Nature's gentlemen, and unquestionably a first rate gardener. Though his innate modesty will cause him to almost shrink from what I am about to say, it has to be said ; and it is this. Mr. Davis is the raiser and grower of the finest Vine in the United Kingdom. No other man living can look upon such a Vine of his own raising and training. Visitors call to see it from far and near, Mr. Peabody declaring that the inspection alone was worth his voyage from America. Planted almost in the centre of a narrow lean-to house, the roof having a sharp angle, the seven arms of the Vine stretch right and left to a length of nearly 230 feet, or if placed end to end more than a quarter of a mile. They are as straight as Vine rods can be, and from the upper side of each horizontal the laterals are trained at suitable intervals—overcrowding being avoided—for

bearing the crop. Before thinning commenced in early summer about 2000 bunches were removed, upwards of 800 being left to ripen. The Grapes are now colouring, and in a fortnight's time will be ripe. They hang with great regularity, and are better at the point farthest from the stem than near it. This Vine was raised from a cutting by Mr. Davis twenty-nine years ago and is in the best of health, having stout clean foliage and excellent fruit. The crop sold last year for £100. In this Vine we have something altogether out of the common, something that shows what Vines can do when they have freedom guided by the cultivator's art.

When admiring this extraordinary example of unremitting care during a generation on the part of the raiser of the Vine, I thought surely here is a case worthy of public recognition, and could not repress a feeling of regret that the Royal Horticultural Society has no medals to grant to men who have achieved really great results outside the exhibition hall. Over and over again must medals have been granted for plants, flowers and fruit, which as representing cultural merit—the work of a season or two—sink into insignificance as compared with this truly wonderful Vine which an able man has spent the best part of his life in producing. I know not the terms on which the Veitch Memorial medals are granted, but if for triumphs in culture by British cultivators may not this great work of Mr. Davis—for a great work it is, and indeed in its way unparalleled—be considered?

There are other Vines at Manresa House on which I should like to dwell but cannot. They may be called substantial novelties, for four of them must have an aggregate length of rod of much more than half a mile, all bearing useful fruit from end to end. Then there are the Peaches. These even without the Vines would have satisfied me, one tree covering a space of 45 by 15 feet of trellis, closely studded with fruit, and dozens of other trees similarly cropped. In one season the fruit from two of the trees was sold to the late Mr. Morgan for £42. That is something to remember; so are the Apple trees thirteen years planted, and grown on the extension system; but the Vine eclipses all. Let those who suspect any exaggeration in this description go and see for themselves. Manresa House is within two miles of either Putney or Barnes station on the London and South-Western Railway.

I have yet Monday to fill in, the real Bank Holiday, though it will be seen I commenced on Saturday. I decided to visit Carshalton Park and see what Surrey cottagers could do, and hear what their mentors had to say at the meeting called a conference. The Show surprised me. The vegetables were remarkable, the fruit good; gardeners and nurserymen adding attractive features. A great multitude attended, and all seemed happy. At the Conference Mr. Cosmo Bonsor, M.P., presided. The Surrey County Council was represented by Mr. E. J. Halsey, Chairman, and Mr. H. Macan, Secretary of the Technical Education Committee. Mr. E. Luckhurst, in a lucid address, said Surrey was leading the way in teaching sound gardening among the masses, and he described how gardens could be made attractive as well as productive. Mr. A. Dean waxed eloquent on the beauty of vegetables as well as flowers, and pointed out examples of excellence in specimens before him. Mr. George Gordon took as his text the gardens he had judged in the district, and commented usefully upon them; while another Judge, Mr. J. Wright, laid down the law on hardy fruit culture. The sides of the tent were taken down, and the people flocked round to hear the speakers, some let us hope taking useful hints away.

Mr. Smee, C.C., appeared to be everywhere and looking after everybody, his gardener (Mr. Cummins) a fixture in his tent, writing out cards and taking in money; while young ladies in a well furnished marquee were selling all the flowers they could for the benefit of the Gardeners' Orphan Fund. Thus did I spend pleasantly and profitably my last Bank Holiday, and I trust this narrative may not be wholly without interest to those readers who were similarly or differently engaged.—A COUNTRYMAN.

NOTES ON THE MANAGEMENT OF VINE LATERALS.

VINES in late houses, when they are in a satisfactory condition, will now be making growth freely, and the way in which the laterals are manipulated will have a marked effect on the finish of this year's crop, and also on the character of the wood produced, upon which we must depend for next year's supply. It too often happens that the removal of lateral growth in the summer months is conducted on principles antagonistic to the well being of the Vines, and therefore conducive to their early enfeeblement. Vine borders may be well made, carefully attended to in the matter of watering and feeding, other details of culture be correctly carried out, and yet the good results which should ensue be to a great extent nullified by faulty management of lateral growth.

If, however, every cultivator considers the two extremes to be avoided the right course to pursue should not be difficult to determine. On the one hand we should avoid allowing Vines to make a large amount of lateral growth, which unduly shades the main shoots, and consequently prevents their becoming well ripened; whilst on the other hand the more healthy foliage which is well exposed to the light each Vine carries, the more numerous and active will its roots be. If through want of attention at the right time Vine shoots are allowed to grow unchecked till they form quite a thicket the worst possible course to pursue is to suddenly remove all superfluous growth at one time, and yet in very many instances this is just what is done. When through pressure of other work this state of things exists the reduction of shoots should be gradually done, or shanking of the fruit and ultimate weakness of the Vines will assuredly follow. Commence by shortening to about half their length a few of the strongest shoots, removing the points from others and allowing the weakest laterals to go untouched for a time. This will admit quite as much light as is desirable under the circumstances. A fortnight after about half the weak shoots may be cut back to within a couple of eyes of the main laterals, and the others be allowed to grow for a time till young shoots make their appearance from those laterals which have already been shortened. In some cases, especially where the Vines are a good distance from the glass, it is far better to leave a lateral here and there till the end of the growing season, as less harm will be done to the Vines by the little shade thus given than would be the case if all young shoots were cleared off in a wholesale manner after having once been allowed to develop too much growth. When shoots are left in that way merely take out the points, and with a piece of tying material draw it down towards the trellis so as to have the bent portion of the shoot forming a little arch above the main laterals. In this way a greater amount of well exposed leafage is secured and the general health of the Vines is benefited by it.

I fully believe that many Vines are seriously crippled by too close stopping during the time the fruit is swelling and stoning. In the early stages of a Vine's growth the stopping of shoots generally receives careful attention, as it is absolutely necessary to go over them regularly to keep the shoots from touching the glass; but when once the main laterals are tied in their final positions the attention given to lateral growth is often of a spasmodic character. I am thoroughly convinced that to keep Vines permanently healthy, strong, and fruitful, a little growth should be continually going on till the fruit is ripe. At the same time there must be no allowing a thicket of lateral growth to shut out the light and air from those shoots to which we look for next season's crop. Perhaps many are misguided in their treatment of lateral growth because black Grapes, especially Hamburgs, will colour splendidly under a perfect thicket of growth; but under this treatment the shoots get weaker, and the bunches smaller each year. The aim should be, and the difficulty is, to have sufficient shade to enable them to colour perfectly while the growth is being gradually ripened, and it is for this reason that a thin shade is of great benefit to Black Hamburgs which are perfecting the colouring process during bright weather.—H. DUNKIN.

VIOLAS AT CHISWICK.

VISITORS to the Royal Horticultural Society's Gardens at Chiswick will find an interesting collection of Violas raised by Dr. Stuart of Chirnside, N.B. They are grown in beds on the lawn, and are very attractive. They are quite distinct from other Violas in commerce, and in my opinion very far ahead of anything yet introduced in Violas. Comparison with other varieties will convince anyone that the type is distinct, and is the result of many years' careful and thoughtful work, and the Doctor is to be congratulated on the charming results of his interesting labours.

As a raiser of *Violas* I can appreciate and recognise the merit due to Dr. Stuart. He has started with the *Viola* in its simplest form, and by a careful mode of cross fertilisation has given us delightful flowers. Truly Nature is charming, but art rightly applied charms Nature. One cannot, on looking at the Doctor's *Violas*, do otherwise than echo the sentiments of the poet on the Pansy:—

"Oh! pensive Pansy, with your eye of gold,
And damask face as bright as English Rose."

I am acquainted with numerous details regarding the introduction of these *Violas*, and the results of the crosses used I can trace in the flower by habit and slight peculiarities of a number of the varieties. The groundwork of the entire collection appears to me to be Dr. Stuart's *Violetta*, a little gem of a flower which has been frequently noticed in this Journal. The history of *Violetta* is as follows:—The Doctor, previous to 1874, crossed *Viola cornuta* with a bedding Pansy called *Blue King*. The most promising seedlings thus obtained were again crossed with a pinkish coloured Pansy, which the Doctor considered a suitable cross. Although the cross was effected with some difficulty owing to the hybridity already gained, the seedlings thus obtained seeded freely, and were sent to Chiswick for trial where they obtained six first-class certificates.

The Doctor still was in the habit of sowing the seed broadcast and treating the plants as biennials, and thus *Violetta* was obtained in 1887. It had peculiarities all its own, which can be traced in the collection now grown at Chiswick. The principal peculiarities are dwarf habit of growth, leaves rounder in form, and darker in colour than other varieties, and the flowers borne on long footstalks. All the flowers have shell-shaped lower petals. The spur of the calyx is exceptionally long and of a different colour from the flowers, which have an almond perfume. I am almost convinced that at some stage of the cross previous to the existence of *Violetta* *Viola odorata* must either accidentally or intentionally entered into the combination.

Most of the varieties at Chiswick are in size of flower very similar to *Violetta*, but varying somewhat in colour. They are all charming, and as bedders cannot be surpassed. The principal colours are white and yellow selfs, but for competition and general uses I want something large in flower and chaste in colour, and this I find in the newer varieties; also, they are all rayless, and are no doubt the result of crossing *Violetta* with such varieties as *Countess of Hopetown*, *Virginalis*, and other rayless or nearly rayless selfs. The best at Chiswick are *Sylvia*, creamy coloured self of fine quality, large in size, and the finest bedder in cultivation; *Sylvia's Rival*, a purer colour than *Sylvia*; *Flower of Spring*, a handsome form of *Sylvia*; *Blue Gown*, light blue self, very dwarf, and floriferous, light centre; *George Muirhead*, a charming flower, large flowering, colour pale yellow; *Mrs. Primrose*, light yellow upper petals, deeper shaded lower petals; *Sweet Lavender*, pale blue with white eye, very fine; *Blush Queen*, as the title indicates it is of a blush colour, and is without doubt the most charming *Viola* in existence; *Picotee*, medium-sized flower with thin *Picotee* edges, very sweet.

There are a number of others all large in flower and good in every way, and their perfume is charmingly their own. They are in perfume truly summer *Violas*. With the exception of *Violetta* Dr. Stuart's new *Violas* are not yet in commerce, but no doubt 1893 will see them catalogued and sent out by someone, and the sooner we have these charming varieties the better for us all, as they will all come to stay regardless of the fact that their progenitors were vagabonds and wanderers by field and fell.—
GEO. M'LEOD, F.R.H.S., Chingford.

PINKS.

THIS fine old florists' flower and garden favourite is again coming to the front, and the recent exhibition of *Pinks* at the great Wolverhampton Show gave an opportunity of seeing some of the leading varieties in cultivation. But to see the *Pink* in its full glory one has to visit the garden of a leading cultivator, and so far as the Birmingham district is concerned Mr. A. R. Brown has at his garden in the Crompton Road, Handsworth, a very complete collection of the finest varieties; certainly the finest collection in the Midlands, and he grows them exceedingly well. At the Wolverhampton Show he was to the front all along the line. His father, the late Mr. Brown, was a well-known florist and he raised some very fine *Pinks*. Amongst them that promising variety *Amy*, the subject of our illustration, was raised some years since, though no pains were taken to increase the stock. It is now to be sent out in the autumn, and *Pink* growers will hail with delight the acquisition of so grand a flower. It is the finest *Pink* of the present day, and will be eagerly sought after at five shillings a pair.

I again this season saw the *Handsworth Pinks* in bloom and took the following notes:—*Amy* (Brown's, fig 14), is very fine in breadth of petal, form, and marking, reddish purple lacing, opening red and changing to purple. It is a noble flower of excellent properties and a great acquisition. *Lustre* (Fellowes) is a large flower that requires care in dressing, with small centre petals. *Bertram* is not a refined flower although most useful in the back row of a stand, heavy red lacing, but not so good as *Minerva* (Fellowes). *Minerva* has a dark red lacing, a very fine flower, and one of the best grown. *Empress of India* is a superb flower with only one fault—it is thin compared with many others. It has a very fine petal, is rich in colour, and with another row of petals it would be a grand flower. As it is it is indispensable even in the smallest collections. *Attractive* (Hooper's) is being

FIG. 14.—PINK, AMY.

discarded at Handsworth. *Blondin* (Turner's) is still a useful old sort of a bright colour, but it is now superseded by *Ada Louise*. *Undine* (Paul's) is a pretty flower, but too small as proved here. Hooper's *Mrs. Barlow* is a pretty variety, very pale in colour, with well-formed broad petals and a full flower; it requires shading. *Hebe* has a heavy dark red lacing which is not regular, but is useful as a back row flower. *Ada Louise* (Paul) reddish purple lacing, is a good useful back row flower. Paul's *Chastity*, light, very purple lacing, is a small but refined flower, with a beautiful petal and first class in quality. Fellowes' *Rosy Morn*, bright rosy purple, medium lacing, sometimes described as red, is a good full flower. John Love is an inferior *Modesty*. Of *Modesty* itself I must again say "in every way it is a grand flower," with light rosy purple lacing, a fine petal, and requires scarcely any dressing.

Paxford's *Ne Plus Ultra*, raised at Oxford, and I think sent out by Mr. Lakin, is a bright rosy purple with a superb petal, and very

promising. Boiard has a small petal, long and narrow; still the flower is a very telling one in a stand, and it is a most useful red laced variety. Bertha (Paul's) certainly beats Boiard, and that is saying a good deal; a flower of excellent qualities, and broader in the lacing than as seen here last year; pure white ground, and a very fine refined bloom. Princess Louise (Fellowes) is a modest style of flower, not so full of petals, but brighter in colour; almost a fine Pink. Mrs. F. Hooper is this year somewhat irregular in lacing at Handsworth, but is a good variety to grow; bright rosy purple lacing, good petal, and well formed. Zoe (Fellowes) is brighter in colour than last year, heavy red lacing with fine grand petals, and is proving to be a fine flower. Ethel is another of the late Mr. Brown's seedlings, light red, very regular lacing, fine petal, and a beautiful flower. Mrs. Dark, another of the Handsworth seedlings, is a fine coloured flower, very constant; a capital border variety, as the pods do not burst, and it is a good grower. Ophelia (Fellowes), light purple, broad lacing, and a well-built flower with good petal, but the lacing is irregular. Turner's Godfrey is still one of the best of the old varieties. Fellowes' Bessie is wanting in form, and at Handsworth is small, and not regarded as an acquisition, but is very bright in colour. Maclean's Ernest has come very fine this year, exceedingly bright, broad red lacing, with better petals than Ada Louise, but of that style of flower. Fellowes' Olympia is a very unsatisfactory flower here, yet in good growth. Here and there a good petal is to be seen, but it is rough in outline and margin. Campbell's R. L. Hector is a dark shaded red lacing, good petal and form, and will make a fine flower. Fellowes' Jeannette is another very broad laced flower, bright reddish purple; large, and with broad petal, and a fine variety in every way.

Fellowes' Lorina is a late bloomer, large and full, with a broad petal and very dark red lacing. Not quite smooth on the edge, but a grand flower, and will be welcomed. Hooper's Emerald is similar to Ada Louise, but not so fine nor so good as Ernest. Richard Dean (Hooper) must be discarded, as it cannot possibly be regarded as an acquisition, the petals, even to the guard petals, being so small. Hooper's Ranger Johnson will also be discarded, as it is very rough and very unsatisfactory. The Rector has not done well here this year, and I am unable to say anything further than it was very fine at Wolverhampton last year, and is undoubtedly one of the best in cultivation. Hooper's Harry Hooper, dark purple lacing, rather feathery, is one of the best. George White (Paul's) light purple lacing is an old variety, but still excellent. Paul's Emmeline, heavy purple lacing, superb petal, and a very fine flower, should be in every collection. Turner's Galopin has heavy purple lacing, good petal, and fine in form. Hooper's Victory is discarded. Paul's William Paul, a late variety, a fine rosy red lacing, is one of the best. Hooper's James Douglas is a very bad grower but a very fine flower.

Mr. Brown adopts layering as his mode of propagation; he is now in the thick of it, and there can be no question as to the great advantages in doing so, as early, strong, well-rooted plants are ready for planting in September.—W. DEAN.

INSECTS OF THE FLOWER GARDEN.

(Continued from page 437, last volume.)

If insects of the aphid tribe are, in the usual order of things, the most numerous about gardens, the most conspicuous are certainly the hosts of species belonging to the tribe of two-winged flies. We see them both in sunshine and in shade (though they prefer the former) from the first warm days of spring to the last sunny days of autumn which usher in winter, and they are on the wing all the daylight; but, as a rule, flies do not take excursions after dark. In this respect they are like insects of the bee tribe, some of which many species of flies nearly resemble, while there are also bees that are commonly called flies. Considered as personal foes flies are really more annoying to us than bees, though they cannot sting, since in some species a puncture from the proboscis becomes the cause of irritation lasting several days, owing to poison being thrown into the wound. Readers will remember the recent case of blood-poisoning by the so-called "bite" of a gadfly at Hatfield, Mr. Balfour's private secretary being the victim. This must be regarded as an exceptional occurrence; but many persons have suffered severely in the summer from the stings of the common gnat or some of its relatives. It is not only in the open country that these insects attack people, they do so frequently in gardens, and one reason for this is that some gardeners have tanks or tubs of rain water which attract gnats, and in which they place their boats of eggs, the larvæ being aquatic. It is therefore desirable, for the comfort of those who may be liable to attacks from such insects, that any water receptacles in which they might breed should either be emptied

whenever the presence of gnat larvæ is discovered, or else so covered over that the insects cannot deposit their eggs.

The objects with which flies haunt the flower beds and plant houses are various. Many species come for the honey, and a few eat the pollen of flowers, as Prof. J. R. Green remarks. Flies generally exhibit only a low order of intelligence, hence in their visits to flowers they show themselves to be both shy and lazy. It has been noticed that they resort to yellow or white flowers quite twice as often as they do to red or blue ones. Like the bees, they do us service by carrying pollen from one flower to another upon their bodies, and are specially useful amongst the plants where the male and female flowers are separate. Death is the penalty which some flies pay who are enticed by a sweet secretion to enter the pitchers of species of *Cephalotus*, *Sarracenia*, and other exotics, which are conspicuous insect killers, and we have also a few native plants that entrap small insects; the Sundew is an instance. Then there are flowers which do not kill flies, but hold them in temporary confinement, such as the Arum and the *Aristolochia*, and this evidently helps on fertilisation. Entering one of these a fly has to push past a fringe of hairs, which afterwards spring back, keeping it prisoner till they have withered. Should the insect have entered bearing pollen grains of that particular species it is likely to leave them on the stigmas, and will probably quit the flower with a fresh supply to bear elsewhere received from its anthers. We may safely regard the majority of flies that visit our flowers as neither friends nor foes, but there are those whose habits are predatory, and which either in the imago or larva state seize other insects annoying to us; also there are groups of flies which are certainly unwelcome to us, for they leave behind eggs which produce larvæ certainly mischievous.

The name of "fly" is not, however, the sole property of the Dipterous order, for it is commonly applied to the aphides, green, black, and brown, though they might more appropriately bear that of "bugs," which suits their position and habit of life. Several small beetles have also been called flies, but I am glad to think most gardeners are now able to discriminate between a true and a supposed fly without being learned in entomology. To the larva of a fly the appellation of maggot is familiarly given, an expressive word, coming from an old phrase alluding to the rapidity with which flies breed or increase. Also it is sometimes called a grub. This name is applied to larvæ of various insects that are really or seemingly legless, and to their stumpy or short pupæ. Though all the larvæ of flies lack these useful appendages, most of them display much activity, and possess an array of muscles enabling them to force their way through obstacles, but of course they cannot crawl on flat surfaces. Some fly larvæ are exceptional, in remaining without motion all their life, hidden amongst the substance supplying them with food.

I think any ordinary observer who has watched flies will have noted the fact that they might be readily divided into two groups by this peculiarity, that some have long, thin antennæ or "feelers," and some have short. Those with the thread-like antennæ are, besides, remarkable for slight bodies, small heads and long legs, which, when the insects are on the wing, are stretched backwards and downwards. We call these flies the *Nemocera*, but they constitute the smaller group. The greater number of these insects belong to the *Brachycera* division, having antennæ with only a few joints and stoutish bodies. Passing by some curious and tiny flies, more often seen hopping than flying, feeders upon fungi, and therefore not particularly noticeable in flower gardens, we come first to the very pretty and lively flies which are called the *Cecidomyiæ*, and which put their mark upon some of our garden plants. Many people probably consider them to be small gnats, though they are distinct from those familiar insects, but, like them, they have antennæ, which, as a glass shows, are very ornamental, and the little glossy wings exhibit rainbow tints. Everybody has seen the knobby enlargements on the stalks and leaves of the common Nettle, and the reddish swellings at the tips of the boughs of the Osier; these are the homes of *Cecidomyia* larvæ; nor are such absent from the flower garden, where they contort shoots or buds, produce galls upon leaves, and even disfigure flowers by making them their abodes. On the *Spiræa*, for instance, we often find red and green warts caused by *C. ulmaria*, and I have detected upon the *Chrysanthemum* tiny galls, caused, presumably, by one of these flies, which, however, does not appear to be common, and only touches the foliage, not the flowers.

Sociality is characteristic of the *Cecidomyiæ*, and parties of them circle about their favourite plants at early morning during the season they are on the wing. Chasing them would be comparatively useless, but it is possible to decrease their numbers by removing and destroying leaves or flowers showing the presence of the larvæ. It is seldom, however, that they are abundant enough upon any plant to disfigure it seriously. But I have been asked whether, seeing the presence of the larvæ of these gall-gnats—shall

we call them?—causes local swellings, they may not have an unhealthy effect upon a plant, affecting its sap generally. So far as our investigations have gone there seems to be no proof that these larvæ affect the vitality to any extent; the most they are likely to do, even if numerous, would be to somewhat retard growth.

Some have wondered what is the life of these flies during the winter months. Evidently the larvæ have then quitted the plants, and either pass some months as pupæ on or near the surface of the earth, or hibernate in the winged state, hiding themselves amongst evergreens, in nooks and crannies, wherever they can find shelter from the storms of winter.—ENTOMOLOGIST.

ROCK GARDENS.

(Continued from page 374, last vol.).

Now that the hurry, scurry, the bustle and confusion (not of the General Election) of the Rose Exhibition season is over, and once more amateurs and professionals have put aside their boxes and tubes and all the paraphernalia of their contests, and can now discuss their achievements, "can shoulder their crutch and tell how deeds were done," I may resume these short notes on the Rock Garden. Thanks to a newly developed taste, at many of the Rose Shows one was allowed to think that there were other flowers in the world besides the Queen, for at many of the Exhibitions—Hitchin, Hereford, Chester, &c., prizes were offered locally for collections of herbaceous plants. It is too late to include alpinists, and indeed if they were admitted their delicate beauty would be overpowered by the more brilliant flowers from the herbaceous garden, but they quickened one's tastes and gave many a useful lesson. The most striking plant that I have seen was a spike of *Eremurus Bungei*, exhibited by the Rev. F. Page Roberts at Chester. It was a thing of beauty, and, next to *E. himalaicus*, the finest I have seen.

In resuming these notes I hope my readers will distinctly understand two things—First, that I do not presume to speak with any degree of authority. As I have frequently said, I am no botanist, and therefore I have arrived at what I know of the subject through my own experience, and especially through my own failures. The other is, that my rockery is really a very small affair. Persons might imagine otherwise from the number of plants I mention; but it is remarkable what a number of things one can grow of these dwarf Alpines. I am contented to grow one specimen of a plant where perhaps others would grow a dozen, and though I lose in effect, yet I gain by being able to grow a good many things I must otherwise discard. And now to resume.

Myosotis.—The dwarf alpine varieties of the Forget-me-not are very beautiful, but they have an unfortunate tendency under cultivation to lose their dwarf character, to become more gross, and under the influence of good feeding to disappoint the grower, who views them then with the same disgust that the stud groom does the little boy he thought would make a capital jockey, but who, under the influence of good living, has spread out and utterly disappointed him. So I have, after trying them several times, concluded it is no use striving to fight against it, have given them up, and am now contented to let *dissitiflora* reign supreme without fear of rivalry.

Lithospermum prostratum is one of those plants about which I feel somewhat ashamed. I have seen it so luxuriant in many places, and I have been so frequently told that it is a most easy plant to grow that to be obliged to confess failure is very humiliating; yet so it has been with me. For years I have tried it, have put it in all aspects and in soil which I was told was most suitable for it, yet it has absolutely refused to make itself at home with me; in some cases dying outright, in others dragging out a miserable existence. I am again giving it another place, and hope it may succeed. This sort of thing has happened to me with other plants, and then without any apparent reason a plant has asserted itself, and thriven just as well as it had failed before. Of the beauty of this low-growing alpine shrub with its brilliant blue flowers there can hardly be a question, and as I have seen it in some places it formed a most delightful object.

Meconopsis cambrica, the yellow Welsh Poppy, very similar in appearance to the Iceland Poppy, is said to like shade. I have found it indifferent as to position, soil, or anything else, seeding itself freely, and coming up in all sorts of places, both in the rockery and in the border, so that one has to be very careful that it does not interfere with other plants.

Nierembergia rivularis, another plant with which I have not been successful, and yet I am told most easily grown, so I hope to give it another trial. It is a dwarf trailing plant with white flowers, and, as its name implies, likes a damp place.

Oenothera marginata, a very beautiful and sweet-scented flower. The individual flowers are large, and with a most delicate

fragrance, alas! only lasting one evening; but they are produced abundantly, and so the bloom continues for some time. It has a curious way of rambling under ground, and appearing in quite a different place to that in which it was planted, and so perhaps it is more suited for the border than for the rockery. I have a plant of it in my herbaceous border. I planted it on one side of the walk, and it has now travelled over underneath the walk to the opposite border where it is flourishing most vigorously. I shall be curious to watch its roving propensity.

Omphalodes Luciliae.—A dwarf alpine plant with flowers of the most lovely shade of soft blue. It is not a very easy plant to grow, nor does it with me increase in size very much, while to propagate it by division of the root seems about hopeless, unlike the more common species *Omphalodes verna*; few flowers come out on each truss at a time, but their lovely shades of colour makes up for any deficiency in this respect.

Onosma taurica.—A very beautiful plant with large racemes of bright yellow drooping flowers, slightly fragrant. It is very showy and worthy of every care. I have not given any protection to mine during the last two winters, and it has succeeded in fairly good condition. It likes a dry situation, and I daresay would like a covering in winter to protect it from the heavy rain and snow. Perhaps one of the most suitable places for it is a dry sloping bank. Although perhaps sometimes overrated it is a most desirable plant, and is sure to attract notice on the rockery.

Papaver nudicaule, the charming Iceland Poppy, is deserving of a place anywhere and everywhere. I think, perhaps, except on large rockeries, it is better to have it as a border plant. The three shades of colour, orange, yellow, and white, are exceedingly pure and bright, the orange one, sometimes called *miniatum*, is especially bright, and when the three colours are combined in a vase they make an exceedingly pretty decoration, and they have none of the disagreeable odour which makes some kinds of Poppies so objectionable in a room.

Plumbago Larpentæ, a late growing and late blooming Alpine plant, with flowers of a deep mazarine blue. The foliage also is very pretty, the young shoots being of a dark olive colour. While perfectly hardy, it very often suffers from an early autumn frost.

Primulas.—Of this extensive and beautiful family there are many which are of easy, and some apparently of difficult culture. Especially is this true of the genuine alpine species. I suppose most persons have had this experience with regard to such kinds as *minima* and *Allioni*, while the Himalayan species are more robust, so much so that some of them can be hardly considered alpinists.

Primula farinosa is an exquisite little Primrose, a native of some of the northern parts of our islands, and abundant throughout the mountainous regions of Europe. The flowers are small, but produced in dense clusters of a rosy pink colour.

Primula scotica, allied to the above, and also a native plant, is very pretty; but I have found difficult to grow. It ought to be grown amongst grass, but then the grass would require to be kept quite closely cut or it would soon overpower it.

Primula marginata is sometimes confused with *P. Auricula marginata*, both having yellow flowers, and both being desirable plants for the rockery. By some the latter is supposed to be the progenitor of our beautiful florist Auriculas.

Primula nivalis.—A very beautiful species with pure white flowers, and a plant that should be grown in good sized clumps, when in the early spring it is a very pleasing object.

Primula Reidi.—A charming species with bold scarlet flowers, but its claims to a position on the hardy rockery has yet to be established, some considering it too tender, and others regarding it as a biennial.

Primula rosea.—This, and especially the variety *grandiflora*, is amongst the most beautiful and highly coloured of the family. It requires a somewhat shady place, where it grows freely. The flowers are of a very deep rose colour. I have found it better after a few years to break up the plant, and replant the separate crowns, as it is apt to become hard, and does not then bloom so freely.

Puschkinia scilloides.—A charming bulb, allied to *Scilla*, having a very neat habit and beautiful blue flowers. It is one of those plants of which slugs are especially fond, and it requires great diligence in keeping it from them. I have surrounded my plants with a zinc collar, and yet withal that have had to search for the marauders at night, finding them literally in dozens. They seem to be so eager for it that they attack the plants earlier in the evening, and so are more readily captured.

Ramondia pyrenaica one of the most pleasing of Alpine plants coming from the Pyrenees, where it grows on the face of the rocks in positions entirely excluded from the rays of the sun, and this position must be imitated. I have seen this done most successfully at St. Albans Court near Wingham, where large masses of red sandstone had been placed in a position facing the north and holes were bored in the face of them in which the *Ramondias* were

planted; here they flourished most luxuriantly and seeded all over the rock garden. It is usually said that this must be planted on the slope, but in talking over it with Mr. Wolley Dod the other day, he said that it was not absolutely necessary, and that it flourished with him quite as well when planted on a level surface. I said to him that I found it was not a very long-lived plant and that I had noticed that my larger plants had become hard, the leaves less luxuriant and the flowers not so abundant. He did not agree with me in this, but said he had plants twelve and thirteen years old flourishing and flowering very freely, and that probably mine had by some means or other been bit by the sun which frizzles them up. This may be possible, although they occupy the same place as they have done for years. It is a very attractive little plant with flowers resembling somewhat some of the Solani, although in truth it is more allied to the Mulleins and used to be classed under the *Verbascum*, and was called the Mountain Mullein. A white variety has been introduced of late years by Fröbel of Zurich, and is very attractive.

Phyteuma comosum.—A rare and very curious Alpine plant, which it is almost impossible to describe, and seems to be very difficult to grow. It requires rough grit and to be planted, I believe, amongst broken stones, and is impatient of wet in the winter. There is certainly no more curious Alpine than this, and yet I have rarely seen it in good condition in the gardens I have visited where Alpine plants are grown.

Pinguicula grandiflora.—This great Irish Butterwort is a most beautiful bog plant. I have tried it, but I fear it is hopeless unless where a bog can be imitated. It does well on Messrs. Paul's grounds at High Beech, in Epping Forest, and I saw them the other day in an artificial bog at Mr. Carrington Leys at St. Helen's, near Maidstone. Probably it does better in the cooler and moister parts of our islands.—D., Deal.

CATTLEYA ACKLANDIÆ.

THOUGH by no means a new addition, yet this remarkable *Cattleya* is seldom seen in flower. It was named by Dr. Lindley after Lady Ackland of Devonshire. In shape the flowers are somewhat like *C. bicolor*. The growths are about 6 inches long, terete, and jointed, with a pair of terminal leaves, elliptical and fleshy. The peduncle, bearing one or two flowers, rises from between the leaves. The sepals and petals are spreading, each nearly 2 inches long, fleshy, greenish yellow, finely blotched and spotted with dark blackish purple; the markings are seen less distinctly on the under sides. The lip is large and three-lobed; side lobes small, not covering the column; centre lobe, after a slight contraction, broadens considerably; colour deep purple with slightly darker veining. The column, which is very broad, is also most conspicuous, and is an intense purple. The plant is a native of Brazil, and may be grown on rafts or in baskets suspended in the *Cattleya* house. I have seen excellent plants grown in peat and moss, but which never flowered. It requires but little moisture. A plant now flowering in the cool Orchid house at Kew is growing on a block of birch, with a little sphagnum kept over the roots by means of wire. If someone could solve the secret of successfully flowering *C. Acklandiæ* it would soon become extensively cultivated.—C. K.

BULBOPHYLLUM BARBIGERUM.

IN this Orchid we seem to have a kind of connecting link between the animal and the vegetable world. Though not by any means a "florists' flower," this wonderful plant is certainly something more than a botanical curiosity. I believe that a plant was exhibited at the Temple Show of 1891 in Sir Trevor Lawrence's group of Orchids, and attracted crowds of people by its curious actions. A plant is at present flowering in the warm Orchid house at Kew, and having been noted in a local paper many visitors have gone to see the "thing." The pseudo-bulbs are small, and surmounted by solitary fleshy leaves about $1\frac{1}{2}$ to 2 inches long; the peduncles rise from the base of the bulbs, bearing racemes of six to twelve flowers. The sepals are small and brownish red, and petals minute. But the lip makes up for their shortcomings; it has a long body, covered with very short yellow velvety hairs; at the end, on both upper and under sides, are tufts of fine purple hairs, and at the extreme tip a cluster of longer purplish threads; these hairs all continually move about. The lip is articulate with the column, and moves up and down in a manner that makes one wonder if in this case

animal sense has not become connected with plant movements. A figure may be seen in the "Bot. Mag.," vol. 87, t. 5288. *B. barbigerum* was introduced by Messrs. Loddiges, from Sierra Leone, in 1836.—C. K.

ANGULOAS AND M. LINDEN.

IN reference to our note on Anguloas on page 51, we have the pleasure to publish a correction we have received from M. Lucien Linden, of the "Horticulture Internationale" of Brussels. This being of some historic interest we give his communication in detail:—"My father has read this morning the note on Anguloas published in your estimable Journal, p. 51, and he has been surprised to see it there mentioned that he had been sent to South America at the expense of some gentlemen to collect Orchids. He instructs me to make known that this is an error, his different voyages having been undertaken by the order and on account of the Belgian Government. What has given rise to this mistake is, that when on his third voyage, undertaken in 1842, in Venezuela, Columbia, and the Great Antilles, my father had sent some cases of Orchids to Mr. Sigismund Rücker at Wandsworth. In these cases were found the Anguloas mentioned in the article of 'C. K.' The thousands of species of dried plants which figure in the large herbaria of Europe, as well as the numerous zoological collections collected by my father in these voyages, indicate sufficiently that they have not been the work of a collector whose special mission was to collect Orchids."

NOTES BY THE WAY.

CHESTER.

CHESTER is one of those towns which have their surprises for those who do not weigh its richness of historical association with its nearness to the great western port on the Mersey, but class it with the hum-drum provincial places of which types must be familiar to everyone. The connection between the two is so obvious that a little reflection usually suffices to correct the mistake; but even if this should not be so, the truth dawns upon the visitor when his name in the hotel book is seen to follow that of a stranger from Mashonaland, half a dozen others from the "hub of the universe" and other American towns; while in place of the expected provincialisms in speech his ears are saluted by Yankee nasalities. The truth is that large numbers of the Americans who support their expressed contempt for this effete old country by pouring into it via Liverpool, find in the ancient border town an attraction too powerful to be passed by. In the average American the bump of antiquarianism (if the phrenologists admit such a landmark on the human cranium) is largely developed, and in Chester there is abundant material with which to gratify it. Thus it comes about that ideas formed of the town as a kind of Sleepy Hollow are rapidly dispelled, and in reality it proves to be a Wideawakeville of the most pronounced description. The contrast between the town and its inhabitants is very striking. The former is quaint, mediæval and stately, savouring of past centuries; the latter are bustling, alert, and up to date, with a business-like 1892 air about them. If in the grim recesses on the city walls at the foot of which flows the rock-lined river, the imagination can replace an armoured sentinel of the middle ages, the vision is knocked down, skittle-like, by the blandishments of a guide book seraph, whose persistency would strike a Maltese shore boy aghast with admiration and envy. If in the glorious form of woman there is an anatomical unit anywhere in the wide world so utterly deaf and blind to every form of negative, expressed or implied, as the guide-sellers on Chester walls, she should be preserved for use at fashionable bazaars. Her talents are at present wasted. As for the journalist who relieved himself of her presence by turning her unwelcome attention to a harmless and inoffensive companion of the pen musing peacefully on the past, he displayed a resourcefulness in extremity that would have done credit to a Fleet Street fruit-seller, who will contrive to cheat you even while he is obeying the "moving-on" command of the policeman beside him.

A GARDENLESS CITY.

Chester, like many of Hodge's Pear trees, has overgrown its walls and spread out branches far beyond the stream which encircles it. On one side, which I can only localise by saying that it is opposite the spot where our guide insisted on relating his boyish experiences of outdoor executions, notwithstanding strong hints that they could be dispensed with, there is much tree beauty, albeit the view is rather distant, and the residences of Chester's great peer out from amongst the foliage. The aforesaid guide, who mingled his professional explanations with minute details of his personal character and career, had apparently stuffed himself too full of antiquarian lore for the delectation of the wandering American to hold any information about modern gardens for the benefit of those interested in them. But we were casual customers, so to say, and judging by his other exploits there is little doubt that he would have fully prepared himself for the emergency had he received fair warning that we were going to be there. Still, he knew of Eaton and Hawarden, and was able to inform us of the various means of reaching them, the cost ranging from 6s. to 9d.; but, unfortunately, time did not admit of their being visited. So far as can be seen from its walls Chester is not a city of flowers, and if an occasional garden was seen it was a half-hearted, out-of-place-looking thing which did not

tempt us to linger. To have wandered round the outskirts of the town would have revealed something better doubtless, but the shades of night had fallen by the time the stream of eloquence from our guide had run its course, and we were fain to leave the modern side unstudied.

DICKSONS, LIMITED.

Whatever may be the shortcomings of Chester so far as private gardening is concerned, she amply atones for them in the wonderful variety and extent of her great trade establishment. About 500 acres represent the land under nursery cultivation by Dicksons, Limited, and it really provides a very remarkable proof of all-round horticultural growth. There are two or three nurseries which it was too wet to visit, and some of which have names that I should be very sorry to have to pronounce. But that they are well worth inspection could be judged from the character of what may be termed the home portion. This is situated quite near the town, certainly less than a mile from the station, although as I had to make my way thither on foot through a tremendous down-pour the distance multiplied itself several times. Its general aspect is such as is appropriate to a large plant establishment, being rendered bright and attractive by judiciously planted shrubs and flowers. There is a considerable number of houses, although they represent only a portion of the total amount of glass. It is pretty well known that Dicksons, Limited, combines the strength of two great establishments, between which a wise amalgamation took place a few years ago, hence the wonderful scope of the nursery. The principals are all practical business men of long experience, well fitted to guide so colossal a concern on a smooth and prosperous course. Fortune, kinder in some respect than in the weather, threw me into the hands of Mr. John Dickson, who displayed a practical mind by the production of a capacious waterproof, and proved a most courteous and able guide. It would have been well had time and the elements permitted a fuller survey, but even under difficulties of the nature indicated many things were seen well worthy of note.

FLORISTS' FLOWERS.

Tuberous Begonias hold so important a place now amongst florists' flowers that in an establishment like Dickson's they are looked for on a large scale. There is no disappointment. The collection is an extensive and beautiful one, in which good types both of plant and flower are observable. The compact, dwarf habit, and long sturdy flower stems, carrying the blooms well clear of the leaves, which are the desiderata now, are strongly in evidence. Moreover, the quality of bloom is admirable, although no attempt is made to grow the plants into exhibition condition. If anything surprised me in connection with them it was the number of breaks into the Picotee-edged type. There was not one but several, not doubles only but singles as well. Chester is not behind the times here. It seems certain that we shall ere long have a representative collection of Picotee-edged flowers, such as would satisfy even Mr. Gumbleton, and we may be forgiven for anticipating a time when we shall have to begin classifying them into heavy and light edge, just as we do Picotees. But to commence this kind of thing would be a doubtful blessing. Zonal and Ivy-leaved Pelargoniums are largely grown. Of the former it is pleasant to observe good examples of the round-flowered type. There is now so rich a store of them that the quartered, sharp-petalled varieties, uneven in outline and often very faulty in the truss, might very well be swept out of existence. They are certainly not wanted in the place of their smooth, evenly moulded, and well-rounded sisters. The Ivy-leaved are beautiful both in pots and out of doors. I venture to think that if the beds of the former could be seen as they are at Chester, the plants allowed to trail and then pegged down, the flattery of imitation would soon set in. Souvenir de Charles Turner is perhaps unapproachable for pots, but bedded out as indicated, it is hard to imagine anything more beautiful than Madame Crousse. Gloxinias are another bright feature. The firm have a good strain, well and largely grown, to tempt their customers, and drive visitors of another type to their note books.

FOLIAGE PLANTS.

There is nothing more astonishing than to observe the enormous scale on which foliage plants are grown in the Chester nurseries. They are proportionately a greater feature than the flowering plants. To mention even a tithe of them would be impossible, for the collection is one of the most complete in the kingdom. Crotons and Dracenas are cultivated in thousands, and so, to turn to Palms, are such popular kinds as Kentia Belmoreana and K. Forsteriana. These are sold literally by thousands when in a small state, and though more profitable at about six years' growth it is very difficult to get them to that stage owing to the enormous demand for them while small. Ferns again are cultivated in surprising quantities. The best known kinds are in very strong force. Mr. Dickson drew my attention to a novelty amongst them that is likely to take a high place. It is called *Adiantum Capillus-Veneris imbricatus*, but do not let any reader connect it in appearance with the old native Maidenhair, for it is quite distinct, and at a casual glance the relationship would not strike one. It more resembles *A. farleyense*, but has a notable advantage over that valuable species in being more hardy. A mishap to a boiler last winter proved in one respect to be a blessing in disguise, for it showed that with the admission of 3° or 4° of frost *A. farleyense* was killed while the newcomer was uninjured. The hardiness would be anticipated from its parentage. It is a most graceful Fern, and promises to have a useful and popular career.

JAPANESE MAPLES.

Acers hold a prominent place amongst the foliage plants, not only out of doors, but under glass. There is a large house full of them, and

their value for conservatory decoration is clearly seen. This is a feature not met with everywhere. When a good collection is grown the distinctness of the leafage and colouring is very striking. Many are finely cut in the leaf, and very graceful, while the rich red-brown, bronzy, and purple of the foliage is effectively blended and contrasted. Especially beautiful are *palmatum*, green; *atropurpureum*, bronzy purple; *dissectum*, bright green, and very graceful; *gracilis*, green, with purple edge and shade; *septemlobum*, green; *s. purpureum*, purple; *s. marmoratum*, green, variegated with white and rose, very beautiful; *japonicum*, pale green; *j. laciniatum*, green, deeply cut; *Hookerianum*, green; and *pietum*, green with tints of bronze. It is easy to realise what beautiful effects could be produced in many private establishments by a judicious association of the green and coloured Maples. The aim would be to secure smooth, quiet harmonies, rather than bold contrasts, and only those with the "nigger girl" idea of colour would fail to enjoy the effect.

ROSES AND FRUIT TREES.

Fifteen acres of Roses mean a very large number of plants and a profuse display of bloom, notwithstanding that the rush of the cut-backs was just over and that of the maidens just coming on. To succeed under the conditions to which the plants are subjected in the Chester nurseries they must be sturdy and vigorous. The soil is heavy and the situation exposed, so that they have to fight against the full effects of extreme cold. It is by no means certain that this is a disadvantage from the nurseryman's point of view, certainly it is not from the buyer's. If in the absence of a generous and mellow soil the former fail to secure the magnificent show blooms that are produced elsewhere there is the compensation of a hardy, vigorous growth, and little doubt, consequently, of the plants succeeding and giving satisfaction wherever they may be planted. Something the same may be said of the fruit trees. They are hardened by exposure, not grown tenderly, and when planted under proper conditions there is little fear of failure wherever they may be. The trade in fruit trees is really amazing, and we see acres of all kinds and types. Of large trained trees, Apples and Plums in particular, there is a splendid collection, also of pot trees, such as pyramid Peaches, Nectarines, and Pears. The demand for these, which had fallen off somewhat, has now sprung up with increased force. Bush fruit is extensively grown, especially Gooseberries. Whinham's Industry, Crown Bob, Early Sulphur, Red Champagne, Warrington, Whitesmith, Golden Drop, and Pitmaston Green Gage, a fruit of delicious quality, are sold in thousands, and the collection of Lancashire prize varieties is very large and complete.

FOREST TREES AND CONIFERS.

It is difficult to convey an idea of the magnitude of the trade in these at Dicksons'. A day or two in the nurseries would be required for that. It is within the bounds to say that Larch, Spruce, and Scotch Fir—to instance three only—are grown by millions. Almost the same might be said of material sold for game cover, such as Laurels, Berberis, Box, Hollies, Hazels, Myrobalan Plum, and Quick, while one order for 50,000 or 100,000 Thorns is not at all uncommon. Then there are enormous stocks of Conifers, such as *Abies Menziesii*, *A. canadensis*, *A. orientalis*, and *A. Douglasii*, many thousands of the latter being sold every year; Cedars, such as *atlantica* and *deodara*; Araucarias; Cypressess, such as *Cupressus Lawsoniana*, *L. erecta viridis*, Silver Queen, and *lutea*, the latter beautiful silver and golden kinds selling very largely; Piceas, such as *Webbiana*, which is grown at the Pwllheli nurseries in a milder locality, *Nordmanniana*, *nobilis*, *Lowiana*, and *grandis*; and Pines, such as *Pinus insignis*, *exce'sa*, *cembra*, *Benthiana*, *laricio*, *austriaca* (grand for a wind screen), *Strobus*, and *sylvestris*. Then there are *Retinosporas*, *Taxus*, *Wellingtonias*, *Thuias*, and a great variety of evergreen and deciduous trees and shrubs, such as *Cytisus*, *Escallonias*, *Euonymus*, Bamboos, *Aucubas*, *Hypericums*, *Sweet Bays*, and *Ligustrums*. To mention more would be merely to multiply names. Suffice it to say that in variety, extent, and excellence of culture Dicksons, Limited, at once astonish and delight the visitor.—W. P. W.

WHICH ARE THE BEST STRAWBERRIES?

I HAVE just received a list of new Strawberries. I, for one, am getting tired of trying new varieties, as I find so few of them bear out their promise. They are generally wanting in some point or other. The great Noble, of which so much was said and written, turns out to be great only in size. It is very difficult to choose amongst so many. What is wanted and asked for on all hands is an improved British Queen or Strawberry of similar flavour. Cannot the Queen and Dr. Hogg be crossed until a good grower and free bearer of that flavour is produced? The only Strawberries sold by the fruiterers and grown about Cheltenham are Sir Joseph Paxton and President. Four sorts only are really wanted—one early, two midseason, and one late. Which are considered the best four of good flavour, good growers, and free bearers; fair size, not too small or too large?—B.

[We leave the choice of the best four Strawberries to our readers. The only way in which we could discover the best for our garden was by trying many; then when we settled the point to our satisfaction, a neighbour two miles distant planted our selection, and some of them he described as worthless with him. We hesitate, therefore, to name four varieties that will be the best for everybody regardless of soil and situation. The "great Noble" is great only in size, says "B." Another grower says it is great in money making, as he sold all his

best fruit, about a ton, at 2s. a pound, from an open field. Do any of our readers know anything about Knivett's or Knevett's Seedling? It is said to possess all the high quality of British Queen, plus hardiness and vigour of growth.]

EVENTS OF THE WEEK.—Shows are not quite so numerous during the ensuing week as they have been recently. On Saturday, August 6th, the Midland Carnation Show will be held in the Botanical Gardens, Edgbaston, Birmingham, where a good display is expected. The Committees of the Royal Horticultural Society meet at the Drill Hall, Westminster, on Tuesday, August 9th, and a lecture on Fuchsias will be given by Mr. G. Fry at the afternoon meeting. There will be an Exhibition at Maidenhead on Thursday, August 11th. Messrs. Protheroe & Morris's usual sale of Orchids takes place on Friday at their auction rooms in Cheapside.

— **THE WEATHER IN LONDON.**—The weather has been warm and summer-like of late, though some days have not been bright. Yesterday (Wednesday) was very dull, the wind having a tendency to back from north-west to west or south-west, and rain is not unlikely to follow. The dry weather has kept the Potato disease in check more effectively than has *bouillie*, some of which has perhaps been wasted.

— **LAYERING CARNATIONS.**—I have been trying the method of making the tongue as described by "B.," page 50, but fail to see that it has any advantage, either in neatness of work or saving time, over the old plan of inserting the knife just below the joint and cutting upwards.—T. S.

— **CARNATION MADAME DE WAROCQUE.**—If I may form an opinion on a single plant of this variety placed out on a border with other Carnations I should say that it will be a very useful one for that purpose. The flowers have opened well, and plenty of strong healthy "grass" has been produced. I hope to put out several plants next season.—T. S.

— **HEAVY TOMATOES.**—The Tomatoes exhibited by Mr. R. Gilbert of Burghley at the last meeting of the Royal Horticultural Society attracted considerable attention. They were perfect in shape and of an enormous size, six fruits weighing 10½ lbs. The variety was Royal Sovereign. It would be interesting to know if any reader has grown heavier Tomatoes than these.—C.

— **CARNATION LADY NINA BALFOUR.**—Messrs. Laing & Mather send us from Kelso blooms of this new Carnation, which was certificated at the recent Show at Edinburgh. The flowers are blush pink in colour, borne on long rigid stems, and the calyx shows not the slightest sign of splitting. This broad petalled decorative Carnation is probably destined to meet with popular favour, for not only are the flowers attractive in colour and bold in character, but they are delightfully fragrant.

— **FLOWER SHOW AT SANDRINGHAM.**—The twenty-seventh annual Show of the Sandringham Estate Cottage Horticultural Society, promoted and patronised by the Prince and Princess of Wales, was held in Sandringham Park on July 27th. Besides cottagers' exhibits, there was a good collection of ornamental baskets of flowers, Ferns, bouquets, and table decorations. By permission of the Prince and Princess the whole of the grounds, conservatories, and green-houses were thrown open to the public.

— **CLEMATIS EMPRESS OF INDIA.**—This Clematis belongs to the Patens section, and is certainly a striking variety when in bloom. I lately saw a finely flowered plant on a south-east wall in the old Abbey gardens, Winchester, which is situated right in the heart of the city, having lately been acquired by the Corporation, and laid out for the benefit of the inhabitants. The gardens are under the charge of Mr. Foot, and they certainly do him credit for the orderly manner in which they are kept. The flowers of the above Clematis are unusually large, and the colour most striking. The young blossoms are of a deep violet shade, parts of which lighten to puce as the flowers mature, finishing off with a purple bar on each petal.—E. M.

— **LINCOLN'S INN GARDENS.**—By permission of the Benchers, the gardens of Lincoln's Inn are now open to the public every evening from half-past six until dusk, and on and after Aug. 15th until the middle of September they will be open from five o'clock until dusk. This permission has been accorded by the Benchers for many years past.

— **PRESENTATION TO MR. W. M. BAILLIE.**—Mr. Baillie, who has relinquished his charge as superintendent of the Luton Hoo Gardens, and who is shortly commencing business for himself as a nurseryman, seedsman, and florist, was on Saturday last presented with a very handsome marble clock by the gardeners on the estate. Mr. Baillie's retirement will be a great loss to Luton Hoo, and although his name has not appeared so prominently of late years in horticultural papers as it did formerly, he still ranks among the leading horticulturists of the day.

— **SUPPORTS FOR ASPARAGUS TOPS.**—Where Asparagus is grown in the modern style, with much more space than formerly, there is a greater opportunity for damage to be inflicted on the fully developed growth by heavy rains and wind than used to be the case when the rows were much closer together. Many persons do not realise the harm done to the roots through the tops being swayed to and fro by strong winds, aggravated by heavy rains, which tend to soften the soil about the stems. The most simple method of supporting the tops is by the aid of Pea sticks thrust into the soil among the stems, placing them on the eastern side of the plants, as the strongest wind comes from the south-west at this time of the year. Where it is possible to place a separate stake to each stem so much the better, but this can seldom be done.—E.

— **THE NATIONAL CO-OPERATIVE FESTIVAL.**—This now well-known co-operative event, which this year enters upon its fifth anniversary, will be held at the Crystal Palace on Saturday, August 20th. The promoters—who are representatives of working men's co-operative societies throughout the kingdom—intend to a great extent to follow their programme of previous years, and provide a flower show under the auspices of the Agricultural and Horticultural Association, an exhibition of co-operative productions from profit-sharing workshops, a great choral concert upon the Handel orchestra of 6000 voices, a choir contest for gold and silver medals, a public meeting, and many Crystal Palace attractions. The General Secretary is Mr. Wm. Broomhall, 49, Bedford Street, Strand, W.C., who will provide full details of the Society's work to inquirers.

— **DIPLADENIA BREARLEYANA.**—Last year we mixed a little of Thomson's manure among the peat and sand in potting one of our plants of the above named gorgeous Dipladenia; so pleased were we with the result that we have used it this year to our three plants, and have sent you two or three of the first flowers opened cut from a plant grown in a 14-inch pot. You will see from the leaves sent, and the size, substance, and deep colour of the bloom, that the plants have enjoyed their fare. Can you tell me if any of the newer varieties sent out lately are equal to *D. Brearleyana* and distinct in colour?—JOSEPH OLIVER. [We have not seen any finer Dipladenia flowers and foliage than the examples sent by our correspondent. The leaves are 7 inches long, 2½ to 3 inches wide, and remarkably stout in texture; flowers 5½ to 6 inches in diameter, of unusual substance and richness in colour. Thomas Speed and Lady Louisa Egerton we have seen as large as those before us, and they are quite distinct, the former rosy crimson, the latter pinkish white.]

— **VIOLA CUTTINGS.**—In order to secure a good stock of plants for next season's bedding, cuttings should be put in at once. It fortunately happens that these useful plants are both easily and quickly propagated in this way:—The cuttings selected should be those which are now springing from the base of the old plants. These should be cut off near the old stools if not more than 2 inches in length, if longer shorten them to about that length. Where any particular variety is scarce the old shoots which have been flowering during the spring and summer may also be made into cuttings, but as they take longer to strike and never make such fine plants as the younger shoots, they should only be used in cases where there is a scarcity of cuttings of the right type. A north or west border is a capital position in which to insert the cuttings. Prepare the ground by thoroughly stirring the surface. If the soil is inclined to be heavy fork in a little leaf or old potting soil. In all cases spread a thin layer of sand upon the surface, press with a board, and dibble in the cuttings 3 inches apart. This will allow them room to grow without crowding till they are planted in the flower beds, either in autumn or early spring.—H. DUNKIN.

— **THE MIDLAND CARNATION AND PICOTEE SOCIETY.**—The annual Exhibition of this Society will be held on Saturday, August 6th, in the Botanical Gardens, Edgbaston, Birmingham. The Society is favoured with influential patrons, and is managed by a strong committee. The schedule is encouraging to exhibitors, six prizes being offered in most of the classes by the Society, while special prizes are offered for specified varieties and kinds of Carnations. A large and interesting display may be expected, and a great floral treat provided for the inhabitants of the metropolis of the Midlands and friends from far and near. Mr. Robert Sydenham is Chairman of the Committee, also Treasurer, and Mr. William Dean Honorary Secretary of the Society.

— **THE BLACK KNOT ON FRUIT TREES.**—Has anyone noticed the black knot on Plum trees, on this side of the Atlantic? In Eastern America, says a daily contemporary, it is causing such destruction that a New York State farmer had in twelve months to root up 5000 trees. At one time this curious wart-like excrecence of the bark was thought to be a gall caused by an insect; but it has been conclusively proved to be simply a fungus which attacks not only cultivated Plums and Cherries, but also the wild species also. Kerosene, turpentine, linseed oil, sulphate of copper, and a mixture of red oxide of iron and linseed oil are among the many substances which have been tried with a view to destroying it. But the only effectual remedy is to cut down and burn the trees at once, thus ensuring the destruction of the spores of the fungus before they spread.

— **A WIDE circle of friends will be interested to hear of the marriage of the REV. F. CAMPBELL PAUL, Rector of St. Peter's, Bristol, and second son of Mr. W. Paul of Waltham Cross, with Miss Nora Kitto, eldest daughter of Rev. J. F. Kitto, Vicar of St. Martin's in the Fields, London.** Mr. Paul was for six years Curate of the Parish of St. Martin, during which period he gained the esteem and affectionate regard of the whole of that extensive parish, by his devotion to the duties of his important office. The high estimation in which Mr. Paul was held was shown in a remarkable manner by the distinguished congregation that assembled in the church to take part in the ceremony, which was performed on Wednesday, the 26th ult., by the Ven. Dr. Sinclair, Archdeacon of London. After the ceremony a large party of friends were entertained at the vicarage, where the many costly wedding presents were on view.

— **VARIEGATED CHRYSANTHEMUM FOLIAGE.**—An American contemporary recently submitted some variegated Chrysanthemum foliage to Mr. J. Thorpe for his opinion. In reply he writes as follows:—"The variegated Chrysanthemum is not a rarity. Raisers of seedlings frequently have variegation among the yearlings. A really good marginal variegation would be valuable, but the splashed forms have proved too unreliable. Some years ago in England there was a Pompon Chrysanthemum with variegated leaves resembling those of Mountain of Snow Pelargonium. This was used as a ribbon line in bedding. Its name was Progress, and it was sent out by Bull in 1858 or 1859." So far as my opinion is concerned, variegation in the foliage of Chrysanthemums is not desirable, and efforts to obtain such cannot be too strongly deprecated. If my memory does not deceive me a variety with variegated foliage was exhibited at Westminster Aquarium and elsewhere a year or two ago, and it was a poor weak thing compared with the robust, dark green leaves of the others.—**CHRYSANTH.**

— **CROCOSMA AUREA IMPERIALIS.**—The description given of the above named grand iridaceous plant in your last issue when intimating the award to it of a certificate of merit at the recent meeting of the Royal Horticultural Society, when it was exhibited by the Chairman of the Floral Committee, Mr. Marshall, is misleading, as instead of the plant having small yellow flowers, as your account says, its individual flowers are of at least the size of a crown piece and of a most brilliant shade of fiery orange colour. It is an exceedingly handsome plant raised by Herr Max Leichtlin of Baden. I have grown and bloomed it most beautifully in the open ground, but unfortunately lost it after the second blooming during the winter, more, I fancy, from excess of moisture during our long damp winters than from any effect of frost, of which we have little of any severity or long duration. The main bulb never blooms more than once, but throws off a number of stoloniferous suckers, each of which terminates in a flowering bulb. I am surprised that it has never before received a certificate of merit, as, though by far the handsomest of its family, it is by no means a new plant, but will always, I fear, be a somewhat scarce and expensive one owing to its inherent delicacy of constitution.—**BOSCOBEL.**

— **PEA DUKE OF ALBANY.**—This is a favourite Pca of mine, and it is difficult to beat even among so many. Those who have had the pleasure of its acquaintance need no advice on the matter, but to readers who have not grown it I would say, Lose no time, but make the "Duke" your sheet-anchor next season if free crops, fine pods, and excellent flavour are the points required. As I have before stated in the Journal we grow this variety for our second crop, and though the Peas are but a very short time behind the earliest in being ready for gathering, they are infinitely superior. Happening to have a warm saug place for the early crop, and by sowing the seed in a late vinery and growing the plants in pots until they are at least 1 foot high, we get our first "Dukes" in good time.—**E. M.**

— **THE PRICKLY PEAR.**—Mr. B. N. C. Fletcher has an interesting account of the manifold uses of the wild Cactus in the almost desert country between San Antonio, Texas, and Chihuahua, in Mexico, in the last issue of the "Kew Bulletin." In this region mentioned rain seldom falls, but when a shower refreshes the ground grass springs up only to be withered by the hot sun, and then blown in a fibrous cloud on the wind. However, around the base of the Cactus the blades remain fresh for a time. The draught oxen of the "prairie schooners" are fed upon the chopped up juicy branches, and after they are turned loose at night search of their own accord for the juicy fruit of this "Prickly Pear." Sheep also fatten on this fruit, which in many countries forms a large part of the poorer people's dietary—and goats, which in dry countries (like Morocco, Malta, Greece, and Mexico) indulge a propensity for climbing, manage to get at the "Pears" on the upper as well as the lower branches. A salad is made from the leaves, the dried branches are burnt, and the sap is used as size to mix with lime for whitewashing, and might be made into a good vegetable glue.

— **MOSELEY AND KING'S HEATH FLOWER SHOW.**—A correspondent sends us a list of the prizewinners at the above Show, which was held on the 1st inst., but in consequence of the pressure incident to the holiday week the names cannot be inserted. Another correspondent indicates the character of the Show as follows:—The entries for the various classes were more numerous than at previous Exhibitions, and four or five large marquees were filled with prettily arranged garden flowers, imposing collections of hothouse plants, fruit, and vegetables. The exhibits were divided under four heads—those sent by gentlemen's gardeners, by amateurs, by cottagers, and decorations by ladies. In the ladies' classes Mrs. Joseph Chamberlain and Mrs. C. P. Lane were pleased to award the prizes. Mrs. Chamberlain, who was accompanied by Mr. Chamberlain and Mr. Austen Chamberlain, arrived at the grounds during the morning, and was met by the President (Rev. D. H. C. Preedy), and was presented with a magnificent bouquet of flowers by Miss Dorothy Lane, a similar one being presented to Mrs. Lane by Miss Mary Hickling. Mr. Chamberlain expressed great pleasure at the Show, and was so delighted with some decorated mail carts prepared by children that he asked permission to present each competitor not gaining honours with a special prize of 5s.

— **CARTER'S DAISY PEA.**—A visit to witness the second application of bouillie bordelaise in one of Messrs. Carter's trial fields of Potatoes near Bromley, Kent, last week, resulted in a disappointment and a surprise. The official Superintendent of the trials was at the last moment prevented from being present, but there was compensation even under such circumstances in a field of Peas, of which it is safe to say the like could not be seen elsewhere. The Daisy Pca, so called by an American in signification of its excellence, was growing in rows about 3 feet apart, that distance being afforded for convenience of cultivating the land with horse power. The rows resembled piles of pods—great bright green pods as large as Telephone, and packed with fat peas from end to end. Not one pod was found with less than eight peas, but many, if not most, contained nine, not eight and an apology, but all full sized peas. Only plants of unusual sturdiness could have borne up under their load so well, and it is only fair to say that some of them were propped up by the pods resting on the ground one over the other in sloping order—a remarkable sight. The plants were between a foot and 15 inches high. The Daisy is strictly a dwarf Pca, but has left all other dwarfs behind in the size of its pods. The quality is of the best. For gardens of all sizes, allotments, and fields this new Pca is adapted, and into many it is bound to find its way. It promises to be a favourite family and a popular market Pca. It is distinct from all others, and likely to long hold a good position amongst the many fine varieties of Peas that the firm have been so fortunate as to introduce to the public. It was raised in their trial grounds at Forest Hill, follows the first earlies closely, and produces a long supply of high-class Peas by successional sowings. Its

merits have been recognised by the Royal Horticultural Society, and the verdict will be confirmed by all who grow such crops as may now be seen in the open field, and not rich soil at Bromley. In rich garden soil the plants might attain a height of 18 inches, and the rows would well deserve a few short supporting stakes.

— **EPERGNE DECORATIONS.**—Not the least interesting features of many summer exhibitions are the epergne decorations, very often confined to ladies—not only with any kind of garden flowers, but wild flowers and grasses. Here is an opportunity for displaying much taste in the arrangement, and this is generally embraced. What I have noticed, however, and wish here to give effect to, is the encroachment some competitors make on the schedule regulations by extending the decoration beyond the epergne itself, laying flowers and foliage on the cloth for fully 6 inches around, making the epergne certainly much more massive in its appearance. At the same time (unknowingly perhaps) such competitors lay themselves open to disqualification, because this form of arrangement is not confined to the regulation epergne. It would be well for competitors in the future to pay attention to this point. It may save the judges an unpleasant duty and themselves some mortification, for it cannot be denied that it is easier to make a more imposing arrangement by the addition than without it.—E. MOLYNEUX.

— **NITROGEN FOR GRASS.**—From some experiments with nitrogenous fertilisers on pasture fields made at the Storrs School Experiment Station in Connecticut, it appears that fertilisers containing potash or phosphoric acid alone are less effective for Grass than if they have some available nitrogen in addition. The Grasses, such as Timothy, Red Top, and the like, must be classed as “nitrogen consumers,” while Clover and the legumes are now called “nitrogen gatherers,” since it seems to be accepted that in some way they gather nitrogen from the air. It would seem desirable, therefore, that fertilisers for pastures, grass lands, and lawns should contain a considerable quantity of nitrogen in a readily available form. Such fertilisers not only increase the total yield of grass, but they also increase the percentage of protein in the crop. Since it is protein that makes blood, bone, muscle, and milk, and as this is the most important and costly ingredient in food, and apt also to be deficient in feeding stuffs, the increase of this substance is a matter worthy of consideration, and a strong additional argument for the use of nitrogenous fertilisers.

— **THE NONNEN MOTH.**—The current number of the “Kew Bulletin” contains a note on the Nonnen moth, which for a long time past has been taxing the resources of the forest conservators in various parts of the Continent. For two centuries this insect (*Liparis Monacha*) has been known to attack forest trees in Bavaria, but in 1890 the damage was estimated to amount to nearly £40,000. As the Bavarian woods are important public and private properties strenuous efforts are being made to check the pest. Already close on £100,000 have been incurred in the campaign against it. In 1890, 60,000 caterpillars were counted on one tree stem alone, and once a Fir tree is stripped bare it never grows again. The principal means taken to combat the enemy is painting rings of lime on the trunks, for it is found that though the caterpillars pass most of their time in the upper branches they either fall or crawl to the ground on warm days and return at night. The rings prevent the ascent, with the result that some 70 per cent. of them can be killed. In time, therefore, it is believed that the plague may be practically exterminated.

— **DWARF BEDDING LOBELIAS.**—By far the best pure white form of these pretty ornaments of our summer garden of the many tried by me is undoubtedly the one named *Reine Blanche*, which I had some two or three years ago from its raiser, whose name I unfortunately have quite forgotten. It is of most excellently compact habit of growth, and produces freely large well opened flowers of the purest shade of white. Some strong plants of it that I lifted from the open ground at the end of last bedding season not only bloomed during the whole winter and spring in the cool greenhouse, but are still covered with flowers, and are really quite a curiosity. A very beautiful and extremely useful deep blue flowered variety of an excellently compact and upright habit of growth is *Die Schöne Darmstadterin*, raised by Herr W. Pfitzer, Stuttgart, from whom I received it direct. Some years ago a variety purporting to have red flowers was sent out under the name of *Omen*, but it was soon discarded. This year Messrs. Carter have sent out *Fermosa*, which is a great improvement in depth and brilliancy of colour, but it does not come quite true from seed, one of my plants being pale and dull. Its habit of growth is unfortunately rather straggling. From Messrs. Ryder of Sale I have also received a variety named *Novelty* not yet bloomed.—BOSCOBEL.

— **AN EFFECTIVE GROUP OF PLANTS.**—At the Winchester Show Mr. E. Hillier, nurseryman of that city, arranged a group of plants the whole width of the hall in front of the stage, which was so unique that a special note of it will not be out of the way. As a rule groups of miscellaneous plants are so stereotyped in their disposal that any change is always welcome. The plants employed on this occasion were of the usual order, with a few exceptions; but instead of “dotting” them here and there each genus was kept by itself, forming masses of one kind of plant only. The hall is probably 80 feet wide, the width of the group being about 6 feet. Standing singly at the back, the whole length of the group, were well-grown Palms 6 feet high. A groundwork of Maidenhair Fern was made, from which were arranged groups of a dark-coloured Clematis in small pots; next to them was another group of well-flowered plants of *Lilium Harrisii*; then came a patch of Tuberous Begonias, Zonal Pelargoniums, small well-flowered Tea Roses in pots, &c. Not the least striking was a number of well-grown plants of *Acer atro-purpurea*, the dark foliage of which contrasted excellently with the bright surroundings of colour and the green base of Ferns. The group was edged with small plants, as Lobelias, *Panicums*, &c., and reflected credit on Mr. E. Hillier, jun., for the tasteful manner in which the arrangement was made.—E. M.

— **EXHIBITING VEGETABLES AT SHOWS.**—From a purely picturesque aspect I think the common practice of showing collections of vegetables in deep unsightly round baskets to be very objectionable. No doubt it is a convenient method for exhibitors, because they can arrange their exhibits at home, and carry them in the baskets to the show with, so far, comparative ease. I observed the other day in a large tent at Highgate, devoted to cottagers' produce, that nearly all the side tabling was occupied with baskets of this kind, some very large ones, and there were about forty in all, if not more. Now generally the vegetables were excellent, but the baskets were very unsightly; still farther because placed in these baskets they were rather crowded, and would have presented a far more pleasing appearance if more fully displayed. Flat wooden trays are certainly more preferable, especially if for particular classes, made all of one size, as flower boxes are for exhibition purposes. These trays may be of about 3 inches inside depth and be painted green; for collections of four vegetables be 20 inches by 24, and for six dishes rather larger. In the case of collections of nine or twelve dishes the trays might be in pairs, so as to render the making of very large ones unnecessary. At Highgate practically one half the table area was unoccupied because the products were too crowded in the baskets, and as these were of the ordinary brown osier, and fully 10 inches deep, they were none too handsome. Proper flat trays would fill the tables entirely, and make a far more pleasing display. It is a pity that what are termed unlimited collections of garden produce should be invited from cottagers, for gardens are unduly stripped to furnish the required bulk. Committees of exhibitions should not form classes of that kind, but all should be so far within due bounds that no encouragement is given to waste simply for the purpose of taking prizes.—A. D.

HARDY FLOWERS FOR DECORATION.

HARDY flowers, both in a cut state and growing also, are destined in the future to take a prominent position in the decoration of English homes. It is not in a cut state that I wish to draw attention to their value, however, but in a growing condition in pots as employed in the formation of groups. At the Southampton Show, held the first week in August, two or three years since, Mr. Ladhams competed in the class for a miscellaneous group of plants. His group was with but few exceptions almost entirely composed of hardy herbaceous plants, which he grows so well, and although he did not obtain a higher position in the prize list than third (which was owing to the wording of the schedule favouring plants of more monetary value) his group was the centre of attraction by a flower-loving public. Such plants as *Lobelia cardinalis*, *L. fulgens*, *Campanula persicifolia* and its white form, also the double variety; and the blue and white forms of *C. pyramidalis* can be most effectively employed. *Hyacinthus candicans*, various Lilies, *Spiræas*, *Delphiniums*, *Liatris*, *Lychnis*, *Doronicums*, *Carnations*, *Pinks*, and *Chrysanthemum maximum* are similarly useful. In fact, these are but a few of the many plants which might be made use of for this purpose.

The point to observe is not to grow them in too large clumps. Choose strong crowns of each kind and confine them to somewhat small pots as a matter of convenience in arranging them. In associating hardy with hothouse plants a thick base of Maidenhair Fern gives a better effect, as many carry but a small quantity of their own foliage. This addition to the green base is all in favour of judicious grouping. What could be more effective in a group than well-grown examples of *Francoa ramosa*? and this (commonly called Bridal Wreath) is a hardy plant. Take, again, *Lilium auratum*, always admired. Canterbury Bells of colours not too bright; for instance, soft rose or pale pink,

light blue and white, are very effective. *Eulalia japonica variegata* is everywhere appreciated, and this is hardy; indeed, there appears to be no actual limit to the number of useful and effective hardy plants at command for decoration in a growing state. It only requires the nerve in exhibitors to employ them more freely in miscellaneous groups, where effect is the salient point to attend to. Where quality is the leading idea then hardy plants cannot expect to compete with Orchids; but for home decoration, where such stipulations are not in force, hardy plants will by virtue of their value come to the front.—E. M.

SMILAX ARGYREA.

THERE are several species of the genus *Smilax*, but they have not been considered of sufficient beauty to merit extensive cultivation,

DISQUALIFIED COLLECTION OF FRUIT AT TRENTHAM SHOW.

IN your report of the above Show you are good enough to refer to the collection of fruit I exhibited, and which was disqualified because it contained two Pine Apples. I have no desire to dispute the interpretation your representative has given to the words used in the schedule, but in justice to myself I beg to be allowed to show that the Judges had no grounds whatever for the action they took in this matter.

The words of the schedule are, "Collection of fruit, nine dishes, to include two varieties of Grapes, one black and one white, three bunches of each, one Melon, and one Pine." If these terms mean anything they mean that in the absence of any stipulation to the contrary (and there is none in the schedule) a competitor after staging the stipulated four

FIG. 15.—SMILAX ARGYREA.

and consequently they are not very frequently met with. A similar estimate can hardly be formed of the species exhibited by L'Horticulture Internationale (Messrs. Linden) Parc Leopold, Brussels, at the last Temple Show of the Royal Horticultural Society under the name of *S. argyrea*, and which is represented by fig. 15. The attractive marking of the leaves invests it with considerable beauty. The groundwork is silvery grey marbled with heavy deep green blotches, the two colours producing a beautiful contrast, as the engraving will show. The stems are slender and armed with sharp spines. The leaves are alternate, narrow, pointed, and lanceolate. The species is said to have been introduced from Peru. A first-class certificate was awarded to it.

dishes is at liberty to make up the other five dishes to complete the collection with whatever kind of fruit he may think proper to use; in fact, there is no rule to prevent his making them all of one kind. In the following class—that for collection of fruit, six varieties—it is distinctly stated these are "not to include more than two varieties of Grapes," therefore the words "not to include more than" being kept out of the nine-dish collection, it is reasonable for an exhibitor to infer that he is not confined to one Melon and one Pine only.

In connection with this question I may state that similar words occur in the Crystal Palace schedule to those used in the Trentham schedule—viz., "Two Pines, two Melons, two dishes Peaches, two of Nectarines, two of Plums are required." At the Palace Autumn Show of 1886 I was a competitor in this class, and was awarded second prize, and amongst other fruits in the collection had three Melons (see report

of the Show in the *Journal of Horticulture* for September 9th, 1886, page 229). So far as I know not one word was uttered, either by the horticultural press, judges, or competitors about disqualifying this exhibit. Other cases might be quoted, but in this ambiguously worded schedule the judges had no justification for their high-handed proceedings.—J. MCINDOE, *Hatton Hall Gardens, Guisborough.*

[According to our correspondent's reading of the schedule he need not have staged anything but Grapes, Pines, and Melons, provided he had made up nine dishes of these, and we shall be very much surprised if that was the intention of the committee. At the same time conditions should be framed that cannot be misinterpreted. In our opinion the judges were right at Trentham, whatever mistakes may have been passed elsewhere.]

HORTICULTURAL SHOWS.

NEW BRIGHTON.—JULY 23RD.

THIS was a Rose Show held on the date named in the grounds of Dr. Bell, J.P., and as the day was fine the Hospital (in aid of whose funds the Show was held) will benefit considerably. There was only a moderate number of exhibitors, owing to the Manchester and other Shows falling on the same day, but some very good Roses were shown.

The nurserymen's first prize was taken by Messrs. Dickson (Limited), Chester, with one of the best exhibits they have made this season. The first prize for twenty-four blooms was won by the Rev. Lionel Garnett of Christleton, carrying with it the National Rose Society's gold medal. Mr. W. Stubbs of Nantwich was first for eighteen, and T. Raffles Bulley, Esq., for twelve blooms. Dr. Bell was first for six light coloured with very fine blooms of Her Majesty, and the Rev. L. Garnett for six dark with Alfred Colomb. There was more competition for the local prize with a bronze medal, which was won by Anthony Smith, Esq.

The success of the Show was assisted by a lawn tennis tournament, and by an excellent display of hardy perennials. In the latter an increased interest is taken, and they give variety to what is felt by many as a drawback in Rose Shows—that is, to the monotony of long unbroken lines of Roses—however brilliant individually. The first prizes for twenty-four and twelve varieties were taken by T. Raffles Bulley, Esq., and W. Holland, Esq.

WELLS.—JULY 27TH.

ONCE more a summer Show has been held in the neighbourhood of Wells, and this time in the grounds connected with Sharcombe, the residence of J. F. Hall, Esq. A better site could not well be found for a flower show, the visitors having the privilege of roaming at will over the beautiful grounds, park, and conservatories.

Cut Roses were a great feature in the display, these being more numerous and of much better quality than are often seen at local shows. The first prize for twenty-four was well won by Messrs. Cooling & Sons, Bath, who had Camille Bernardin, Dupuy Jamain, Jean Lilivere, Queen of Queens, Harrison Weir, Mrs. J. Laing, Le Havre, Duchesse de Morny, Marie Margot, C. Darwin, Merveille de Lyon, Prince Arthur, Marie Baumann, A. K. Williams, Madame Joseph Desbois, Star of Waltham, Lady Sheffield, Leopold I., Denmark, Earl of Dufferin, Lucie Corbic, and Suzanne Marie Rodocanachi, all in excellent condition. Messrs. Keynes, Williams & Co., Salisbury, also exhibited fine blooms, but by mistake included three Teas. They were awarded an extra second prize, and a second prize went to Dr. Budd, Bath, who also staged very fine Roses. In the amateurs' class for twelve varieties, distinct, Dr. Budd was easily first, having fairly good blooms of Alfred Colomb, Duchesse de Morny, Charles Lefebvre, Eugénie Verdier, Queen of Queens, Louis Van Houtte, Clemence Joigneaux, Duke of Wellington, Marie Margot, Baroness Rothschild, Comte Raimbaud, and Merveille de Lyon. Mr. Wootton, gardener to J. M. Spencer, Esq., was second. Good prizes were offered for baskets of Roses, the first prize going to the Hon. Miss B. G. Sugden, the second to the Hon. Miss F. Sugden, and the third to Mr. J. B. Payne, gardener to the Lord Bishop of Bath and Wells, the two former especially having very light and attractive arrangements.

Cut flowers of tuberous Begonias were also extensively shown, and were of more than ordinary merit. Particularly good was the first prize stand of eighteen double varieties, distinct, shown by Mr. B. R. Davis, Yeovil. Some of the best of these were La France, Salmon King, Hamlet, Mrs. Cornwallis West, Madame Rocher, F. F. Fox, Albert Crousse, Major Hope, Rubens, and Beauty of Somerset. The second prize went to Mr. E. Brookes, other exhibitors also showing creditably, but were much overweighted by Mr. Davis' grand flowers.

Among the prizewinners with Ferns and other plants were Messrs. Wilkinson, gardener to C. C. Tudway, Esq., J. B. Payne, F. Clarke and J. F. Mould, Pewsey. Mr. Payne was first for black Grapes and Mr. Wilkinson second, the last named being first with white Grapes and Mr. Trevilian, gardener to J. Allen, Esq., second. A very good fruit of a seedling from Hero of Lockinge gained Mr. Payne the first prize in the Melon class, Mr. Stokes, gardener to D. McLean, Esq., being second; several other good fruits being shown. Strawberries, Cucumbers, Tomatoes and collections of vegetables were fairly well shown.

From Messrs. Veitch & Sons, Exeter, came a bank of choice flowering plants, several boxes of Alpine plants, stands of Roses, herbaceous flowers, and hardy foliage, a very attractive display being made. Messrs. Cooling & Son staged a grand box of Rose Alfred Colomb and other boxes of mixed Roses, as well as a fine lot of cut herbaceous flowers. Messrs. Keynes, Williams & Co. also had several boxes of good Roses, and near at hand was a fine exhibit of cut Begonias both double and single flowering in good variety, numbers of neat little Ferns, Palms

and other fine-foliaged plants showing these off capitally. Messrs. Browne and Son, Wells, staged hardy fruit in excellent variety and style.

HAYWARD'S HEATH.—JULY 27TH.

MR. PANNETT once more placed his beautiful meadow in South Road at the disposal of the Committee on the occasion of their fourth annual Show. The weather was brilliant throughout, and a large company was present during the afternoon and evening. The entries were not quite so numerous as last year, which may be accounted for in the fact that the Society got into financial difficulties, and in consequence wisely made some reduction in their prizes. There was unfortunately a falling-off in the number of miscellaneous groups, the two R.H. Society's medals awarded in this class for the first time not having had a stimulating effect. Mr. S. Horscroft, gardener to Mr. Potter, Hapstead House, Ardingly, has the honour of carrying off the silver medal with a very fair group, in which well-coloured Crotons was the best feature. The bronze medal was awarded to Mr. J. Sands, gardener to T. Bannister, Esq., Hayward's Heath. Mr. A. Scutt, gardener to Mrs. Jenkins, Burgess Hill, and Mr. G. F. Wickham, gardener to Mr. Humphry, Keymer, were first and second for the best group of foliage plants. Mr. A. Stamp, gardener to Mr. W. Knight, Hayward's Heath, was first for four stove and greenhouse plants; and Mr. G. F. Wickham had the best four foliage plants. Undoubtedly the brightest and best contested classes were those for Gloxinias and Begonias, Mr. F. Baker, gardener to Mr. Brady, Burgess Hill, being successful in both classes; Mr. G. F. Wickham won first prizes for Ferns, Fuchsias, and a specimen foliage plant.

There was a fine display of hardy herbaceous cut flowers in the three classes, Mr. W. Manton, gardener to Mrs. Clifford Borrer, Bolney, taking first in all three. Mr. J. Mitchell, gardener to Major Moberley, Cuckfield, was first for Cactus and Show Dahlias, also Asters, all very good. Mr. G. Jupp, gardener to F. Campbell, Esq., Brantridge, Belcombe, had the best twelve Roses. There was good competition in the ladies' class for a basket of flowers, Mrs. A. Alwin, Miss Vincent, and Mrs. Brockway coming in the order named with three very pretty baskets. Mrs. Alwin was also placed first with her dinner table centrepiece.

With the exception of the classes for black Grapes and Melons, the entries of fruit were rather short, but of fair quality; small fruit very good. Mr. R. Inglis, gardener to Mrs. Cunliffe-Lister, Borde Hill, was placed first for black Grapes, Mr. J. W. Long having a similar award for good Muscats, the same exhibitor being first for Melons. Other successful exhibitors were Messrs. G. Jupp, J. Mitchell, G. F. Wickham, W. Upton, H. Brading, gardener to Mr. Woods, Wivelsfield (Tomatoes very fine), J. Lands, and J. Lingley.

There were numerous collections of vegetables, and in the larger classes some excellent exhibits. Mr. J. Mitchell had the honour of defeating the local champion (Mr. Mentons) in both the Society's class for nine dishes, and the prizes given by Messrs. Sutton & Sons. Mr. F. Godby won Messrs. Cheal's prize, and S. Horscroft had Messrs. Wood & Sons', while Mr. J. Harris, gardener to C. W. Hudson, Esq., staged the best collection for Messrs. Carters' prizes. When so many special prizes are offered it would be advisable in future for the Society to offer prizes for single dishes of vegetables.

Several exhibits not for competition made an imposing display. Conspicuous amongst these was a fine group of plants staged by Messrs. Peed & Sons. An artistically arranged group of foliage plants, Begonias being largely used, also wreaths and crosses on black velvet, the whole having a chaste appearance, were shown by Mr. Ellis Turner, florist, Hayward's Heath. Mr. W. Knight, Hailsham, and Messrs. Wood & Sons had Roses, &c., and Messrs. Balchin & Sons had a small group of plants. The amateur and cottagers' classes were scarcely so well filled as on former occasions, but on the whole was a creditable show. Much credit is due to Mr. A. R. Pannett and Mr. C. Clarke (Chairman and Vice-Chairman) in bringing the Society through its financial difficulties, and their new Secretary (Mr. A. Tidey) has energy, method, and business capacity enough to insure success in the future.

HESSLE AND HOWDENSHERE.—JULY 27TH AND 28TH.

HESSLE is a pleasantly situated village near Hull, and the home of the Hesse Pear. The Society is a new one, and the first Show was held in the charming grounds of Tranby Lodge, by kind permission of John Sherburn, Esq., J.P. It was an excellent representative display, a really good beginning, and the Society is probably destined to attain a strong position in the district. It is in the hands of the right men as managers, and it is hoped they will receive generous support. In view of the large number of classes little more can be done than to record the winners of the several prizes in the chief classes.

Class I, for a group of plants arranged in a space of 100 square feet, effective and artistic arrangement being considered the chief point of merit. First prize, silver cup value £5 and cash prize £5. James Reekitt, Esq., Swanland Manor, Brough (gardener, Mr. George Wilson), won the premier position with a group of grand plants, but rather too heavy. Second, Arthur Wilson, Esq., Tranby Croft (gardener, Mr. J. P. Leadbetter), who had a splendidly arranged centre, a free cone of Asparagus dumosus brightened with Streptosolons and Disas, relieved with Tuberoses. The sides were rather too light and the margin weak of this group. The third prize was adjudged to Messrs. R. Simpson and Son, Selby, and fourth to R. Falconer Jameson, Esq., F.R.H.S., Hesse (gardener, Mr. John Bridle), with little to choose between them. Mr. Jameson's plants were in excellent condition, but too many were employed in the group. With a smaller group 75 square feet Benjamin Whitaker, Esq., Cliff House, Hesse (gardener, Mr. George Jarvie), was

first, and W. Robinson King, Esq., North Ferriby (gardener, Mr. W. H. Hotham), second; the prize group was cheerful with flowers, the second neat with Ferns and Crotons. F. S. Grotrian, Esq., Hessle, exhibited an effective group of plants, not for competition. Six stove and greenhouse plants, not less than three in flower.—First, Arthur Wilson, Esq., who had very large Palms, also one of the grandest Hydrangeas that it was possible to grow in a flower pot; second, James Reckitt, Esq., who staged a splendid *Pritchardia robusta*. Mr. John Sunley, Monk Fryston, Milford Junction, was first with three plants, and B. Whitaker, Esq., second. The prizes for three foliage plants were secured by Mr. A. Wilson and Mr. R. Falconer Jameson respectively. Mr. Arthur Wilson had the best six Ferns, Tuberous Begonias, and Caladiums; Mr. Jameson being first with three Caladiums. A large display of *Mignonette* in pots was shown by the same gentleman, not for competition.

Roses were well represented and greatly admired. In the class for twenty-four blooms Mr. J. Mallender, gardener to Mrs. Mellish, Hodsock Priory, Notts, outdistanced all competitors with good well-arranged blooms of the following varieties:—*Her Majesty*, *Marie Rady*, *Margaret Dixon*, Mrs. John Laing, *Ulrich Brunner*, *Lyonnaise*, *Duc de Rohan*, A. K. Williams, *François Michelin*, *Madame Victor Verdier*, *Captain Christy*, Duke of Edinburgh, *Suzanne Marie Rodocanachi*, *Marie Baumann*, *Madame Cusin*, *Emily Laxton*, *Catherine Mermet*, *Hippolyte Jamain*, *Madame de Watteville*, *Le Havre*, and *Madame Angèle Jacquier*. Second, Mr. Arthur Wilson. Third, Mr. W. R. King. The prizes in the class for twelve Roses were won by J. E. Wade, Esq., J.P.; Rev. Canon Paget, Welton; and Mr. B. Whitaker in order named. J. Sherburn, Esq., had the best six Carnations; Mr. G. Cottam, the best epergne for table decoration; and Messrs. Perkins & Sons, Coventry, the best bouquet.

Fruit was not extensively, but very creditably exhibited. In collection of six varieties, first, J. E. Wade, Esq., J.P.; Brantinghamthorpe, Brough (gardener, Mr. Wm. Curtis); second, Sir Talbot Constable, Bart., Ferriby (gardener, Mr. J. Williamson); third, B. Whitaker, Esq. In the class for nine varieties, first, Earl of Harrington, Elvaston Castle (gardener, Mr. J. H. Goodacre), with grand Black Hamburg Grapes, the bunches in faultless condition, carrying a splendid bloom; a fine Queen Pine, Negro Largo Figs, Circassian Cherries, Elruge Nectarines, Foster's Seedling Grapes, and a splendid Countess Melon. Second, Jas. Reckitt, Esq., Swanland Manor. With two bunches of black and two of white Grapes, Mr. Goodacre was first; second, J. E. Wade, Esq. A dish of six Peaches, first, J. E. Wade, Esq.; second, H. W. Meggitt, Esq., Kingston Lodge, Hessle (gardener, Mr. Wm. Hogg); third, Mr. Goodacre. Six Nectarines, first, Mr. Goodacre with Elruge; second, J. E. Wade, Esq.; third, Sir Constable, Bart. One Melon, first, Arthur Wilson, Esq.; second, Earl of Harrington. Strawberries, first, R. Falconer Jameson, Esq., with a splendid dish; second, J. Sherburn, Esq. (gardener, Mr. J. B. Hardy).

VEGETABLES.—These were very good. Collection of vegetables in twelve distinct varieties.—First, R. Falconer Jameson, Esq. (gardener, Mr. Jno. Bridle), Cucumbers and Mushrooms excellent. Second, Arthur Wilson, Esq. Third, Jas. Reckitt, Esq. In the collection of vegetables in six varieties Mr. Falconer Jameson was again first. Collection of Potatoes in six varieties.—First, Jas. Reckitt, Esq. Second, W. Robinson King, Esq. Tomatoes, twelve fruits.—First, Mr. J. W. Backhouse, Beverley. Second, R. W. Meggitt, Esq., Kingston Lodge, Hessle. Cucumbers.—First, R. Falconer Jameson, Esq., with models of culture. Second, Mr. G. Cottam, jun. Third, Mr. J. W. Backhouse.

MISCELLANEOUS.—A very interesting exhibit of garden Roses by Mrs. Mellish, Hodsock Priory (gardener, Mr. J. Mallender), attracted much attention; the varieties were W. A. Richardson, *Lucida plena*, *Ophirie*, *Fellenberg*, *Duarte de Oliveira* (a charming Rose), *Vivid*, *Reine Olga de Wurtemberg*, *Celeste*, *York and Lancaster* (true), *Crimson Provence*, *Rosa Mundi*, and others (award of merit). Mr. George Swaile, The Nurseries, Beverley, exhibited a splendid stand of Teas, also a stand of his new Rose Mrs. Arthur Wilson, H.P., a little darker than Mrs. John Laing, and likely to be heard of again (certificate). Messrs. F. Sander and Co. of London had two charming tables of Orchids (silver medal). Mr. G. Cottam, jun., had an interesting collection of Ferns, Lilioms, and other plants. Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, had a superb exhibit of Orchids, Palms, and Ferns (silver medal). Messrs. Dixon, the Yorkshire Seed Establishment, Hull, had a charming group of table plants, Crotons, Palms, Orchid, *Bouvardias*, and choice shrubs (silver medal). Messrs. W. Edwards & Sons, new Edwardiane floral decorations and Ferns (award of merit). Messrs. Cannell & Sons had a charming exhibit of double Begonias, which astonished the visitors (silver medal). Messrs. Clibran & Son, Altrincham, superior cut flowers (award of merit).

Mr. Martin, seedsman, Hull, had a large display of garden sundries. William Cutbush & Sons, London, had decorative plants for table and hardy flowers (first-class certificate). Messrs. Richardson & Co., Darlington, had frames of houses, blinds, boilers. Mr. A. P. Johnson, useful amateurs' greenhouses and frames. The British Metal Expansion Company had fencing, tree guards, latticework, &c., of an excellent character; and Messrs. Caesar, Knutsford, well-made rustic work. The above, with various other exhibits of articles pertaining to gardens, made an imposing display. Notwithstanding counter attractions there was a good attendance of visitors, and although the outlay must have been considerable there appeared promise of a financial success.

PRESCOT.—JULY 28TH.

ON Thursday last the eighth annual Exhibition was opened in Knowsley Park (kindly lent for the occasion by Lord Derby). The Show in many respects was above that of former years, but in the plant classes there was

a slight falling off. The collections of fruit were above the average, and vegetables throughout excellent. In the afternoon a large number of ladies and gentlemen resident in the neighbourhood paid a visit to the Show, and seemed very pleased with the arrangements carried out by Messrs. Learmont and Thompson. The Judges were Messrs. Tunnington, Carling, Stoney, and Smith.

For six stove and greenhouse plants Mr. Edward Blythian, gardener to Mrs. Baxter, Rainhill, took first honours, having a grandly flowered *Statice Holfordi*, *Plumbago capensis alba*, and *Abutilon Boule de Niegé*. The second prize was awarded to Mr. R. Pinnington, gardener to Mrs. Banner, Blacklow House, Roby, who had a good *Chamærops Fortunei*, *Croton Queen Victoria*, and *Statice profusa*. For four stove and greenhouse plants in flower Mr. Blythian was again first, having again a capital *Statice Holfordi* and *Plumbago capensis*. The same exhibitor took first honours for four Fuchsias. Six stove and greenhouse brought out only Mr. Pinnington, who had a fine *Adiantum farleyense*, *Dicksonia antarctica*, *Cibotium Schiedei*, and *Davallia bullata*. Mr. Pinnington won in the class for six Gloxinias. Mr. James Humphreys, gardener to E. S. Eccles, Esq., The Orchard, Huyton, took second prize for six single and first for double Begonias. Cockscombs were of good quality, the first prize being secured by Mr. W. Lyon, gardener to A. Mackenzie Smith, Esq., with well-flowered specimens. Mr. J. Bounds, gardener to A. L. Jones, Esq., Aigburth, was first with a group of plants 60 square feet, arranged for effect, Mr. H. McFall closely following.

Roses, considering the season, were in good condition. For eighteen cut Roses Mr. John Beesley, Prescott, was first with *Captain Christy*, *Paul Neyron*, *Marquise de Castellane*, *Etienne Levet*, *Merveille de Lyon*, *La France*, *Général Jacqueminot*, *Victor Verdier*, *Alfred Colomb*, *Queen of Queens*, *Baroness Rothschild*, *Fisher Holmes*, *Madame Gabriel Luizet*, *Marie Baumann*, and several not known. The second honours were awarded to Mr. W. Allan, gardener to C. S. Musson, Esq., Huyton. For twelve blooms Mr. Wharton, gardener to J. Royston, Esq., Huyton, was first with an excellent selection. The prize for six went to Mr. T. Eaton, gardener to J. Parrington, Esq., also with beautiful blooms. Mr. Eaton secured the prize for twelve varieties of cut flowers with bright and fresh examples.

Six collections of four dishes of fruit were staged. Mr. W. Oldham, gardener to Joseph Beecham, Esq., Ewanville, Huyton, was an easy first, his *Duke of Buccleuch* and *Black Hamburg Grapes* carrying great weight. The other dishes were *Royal Sèvre Peach* and *Blenheim Hybrid Melon*. Second, Mr. T. Eaton, with well-coloured Grapes and Nectarines. Third, Mr. R. Pinnington, with good dishes, but Grapes not quite finished. For two bunches of *Black Hamburg* Mr. Oldham came in first, but there was little difference between his and the second, awarded to Mr. J. Barker, gardener to J. W. Raynes, Esq., Rock Ferry. Mr. Barker won with two perfect bunches of *Madresfield Court*. Mr. Blythian was second with beautiful *Black Alicante*, and first with *Buckland Sweetwater*. The prize for Muscats went to Mr. H. Ewbank, gardener to J. S. Heaps, Esq. Mr. Oldham was second for any other white. Messrs. Gray, Case, Barker, and Gibbs won with Cherries, *Black*, *Red*, and *White Currants*; Raspberries, Strawberries, and Apples, and Gooseberries being best shown by Messrs. Humphreys, Pinnington, Gray, and Bounds; Peaches and Nectarines by Messrs. Ewbank and Barker.

VEGETABLES.—These are always shown in splendid condition. In the collection for twelve varieties Mr. J. Pownall, Prescott, had a fine collection, the best being *Dwarf Mammoth Cauliflower*, *Early Gem Carrot*, *White Lisbon Onion*, *Lyon Leek*, and beautiful Cucumbers. Mr. Isaac Case had also a grand exhibit, the best being *Challenge Celery*, *Ailsa Craig Onion*, and *Chancellor Potatoes*. The prizes for Potatoes, Cucumbers, Peas, Beans, Cauliflowers, Onions, Turnips, Carrots, Marrows went to Messrs. Fleming, Lockett, McFall, R. Pinnington, J. Lyon, J. Cook, Sharkey, and Barker; whilst the prize for three dishes of Tomatoes was awarded to Mr. R. Pinnington. Second, Mr. N. Mercer. The cottagers' produce was excellent. To Mr. John Young, the hard-working President, Mr. Robert Rigby, the indefatigable Secretary, and the excellent Committee the highest praise must be given for the thorough manner in which the Show was conducted.—R. P. R.

WARWICK.—JULY 28TH.

THIS Show was held on the date named in the grounds of Mr. G. Nelson. The number and high quality of the exhibits staged was fully maintained. An open class was this year provided for cut Roses, which brought out some fine blooms, though not a large number of exhibits. In the class for twenty-four Hybrid Perpetuals, Messrs. Perkins of Coventry were in fine form. Their best blooms were *Her Majesty* (grand), Mrs. J. Laing, *Comtede Raimbaud*, *Suzanne Marie Rodocanachi*, A. K. Williams, *Beauty of Waltham*, and *Madame Eugénie Verdier*. This stand was deservedly placed first; Mr. Prince of Oxford being a good second. For twelve Teas Mr. Prince turned the tables on his opponent; he staged beautiful blooms of *Madame Hoste*, *Ernest Metz*, *S. A. Prince*, *Princess of Wales*, *Madame Lambard*, *Comtesse de Nadaillac*, and *Marie Van Houtte*.

Several trade firms put up good groups of plants, cut blooms of herbaceous plants and Roses. Mr. H. Wingrove, gardener to G. H. Nelson, Esq., Rousham Park, staged (not for competition) a highly meritorious collection of fruit. *Lockie's Perfection Melon*, *Muscat of Alexandria*, and *Grosse Mignonne Peaches* were all good, but the three beautiful bunches of *Black Hamburg Grapes* are worthy of special mention. The bunches were of good size and compact shape, every berry being perfectly coloured, and were good enough to hold their

own in any competition. A certificate of merit was awarded by the Judges.

The arrangements were efficiently carried out by Councillor Lloyd-Evans, the Hon. Secretary, who has for many years taken a warm interest in the Society.

SOUTHAMPTON.—JULY 30TH AND AUGUST 1ST.

THE annual summer Exhibition was held as usual in the Society's grounds, Westwood Park, and was a credit to all concerned. Mr. Fudge was quite to the front with the secretarial duties, and the Committee deserve all thanks for their endeavours to make the Show what it was—a success.

PLANTS.—The principal class was that for ten stove or greenhouse specimens, five in bloom and five foliage. Mr. F. Jennings, gardener to W. Garton, Esq., Roselands, Woolston, was easily first with handsome specimens, the most noteworthy being *Latania borbonica*, *Croton Warreni*, richly coloured; *Kentia Fosteriana*, *Croton angustifolium* in superb condition; *Allamandas Hendersoni* and *nobilis*, and *Statice profusa*. Mr. E. Wills, florist, Winchester Road, Shirley, was second; and Mr. Blandford, gardener to Mrs. Haselfoot, Moorhill, Bitterne, third. The class for six specimens made a good display. Mr. J. Amys, gardener to the Hon. Mrs. Elliot Yorke, Hamble Cliff, Netley, won with large, healthy specimens of *Latania borbonica*, *Cycas revoluta*, *Kentia Fosteriana*, *Ixora Prince of Orange*, and a huge *Allamanda Hendersoni*. Mr. Wills was second, and Mr. W. Peel, gardener to Miss Todd, Sidford Lodge, Shirley, third. The following class was devoted to gardeners only, and was for six miscellaneous plants, half to be in bloom. Mr. Wilkins, gardener to Lady Theodora Guest, Inwood House, Henstridge, Blandford, was first, Mr. Peel being second. The former had a *Bougainvillea glabra* in excellent condition. Mr. Jennings won the first prize for a specimen foliage plant with a huge and highly coloured *Croton Disraeli*, Mr. J. Evans, gardener to Lady Ashburton, Melchet Court, Romsey, following with *Cycas revoluta*. Stove or greenhouse Ferns were magnificent. For six Mr. Jennings was distinctly ahead with extremely healthy, well grown plants of *Nephrolepis davallioides furcans*, *Adiantum elegans*, *Microlepia hirta cristata*, *Adiantum cardiochleana* and *A. fragrantissima*. Mr. Peel was second, and Mr. Amys third. Hardy Ferns were good. Mr. Blandford won for six, Mr. Busby, gardener to F. Willan, Esq., Thornhill Park, Bitterne, being second. Mr. T. Hall, gardener to S. Montagu, Esq., M.P., South Stoneham House, was first with six *Fuchsias*, and Mr. Blandford staged the best single Zonal *Pelargoniums*. Mr. Peel won with six *Lycopodiums*, Mr. Wills being second. Mr. Hall won with double *Begonias*, Mr. Wilkins doing likewise with single varieties, medium-sized plants with large blooms. Table plants were also good. Mr. Grigg, gardener to — Hargreaves, Esq., Cuffnells, Lyndhurst, was first with suitable specimens. Mr. Budd, gardener to F. Dalgety, Esq., Lockerby Hall, Romsey, staged the best *Cockscombs*, and Mr. E. Carr, gardener to W. A. Gillett, Esq., Fair Oak Lodge, Bishopstoke, had the best eight *Gloxinias*. Prizes were offered for a collection of Orchids, arranged with small Ferns or Grasses, which gave a pleasing effect. Mr. Blandford was first with an interesting display, and Mr. E. Carr second. Mr. Budd staged *Cattleya Sanderiana*, rich in colour, for the best single Orchid, Mr. Wills being second.

Groups for effect were a feature of the Show, filling one side of the centre of a large tent. That for 130 square feet was the leading class. Mr. Wilkins succeeded in beating his rivals, Mr. Wills and Mr. Carr. In the first prize group the base was flat and composed of Maidenhair Ferns, from which arose well-grown suitable sized Palms, Crotons, *Francoa ramosa*, *Streptocarpus*, neatly margined with *Caladium argyrites*. Mr. Wills was second with a creditable arrangement, Mr. Carr being third. In a group of 90 square feet Mr. Peel was an easy winner, with a somewhat heavy arrangement. Mr. Hall followed.

Cut flowers were staged in large numbers and of capital quality. Roses made a good display, the blooms being especially bright in colour, and of good form if not large. For twenty-four blooms, distinct, Messrs. Keynes, Williams & Co., Salisbury, easily won, the most noteworthy being Duke of Edinburgh, Marie Baumann, Etienne Levet, Ella Gordon, Duc d'Orleans, Lady Mary Fitzwilliam, Ulrich Brunner, and Prosper Laugier. Mr. W. Taylor, Osborne Nursery, Hampton, Middlesex, was second. For twelve blooms, Dr. D. Seaton, Rutland Lodge, Bitterne, was first, Mr. Hall second. Stove and greenhouse blooms were well staged by Messrs. Budd and Evans, the prizes going in the order named. Hardy herbaceous blooms were excellently staged in the class for twelve varieties. Mr. M. Prichard, Southborne Nursery, Christchurch, was first; Mr. Ladhams, Shirley, second, and Mr. Evans third. Carnations were well shown by Mr. E. C. Goble, nurseryman, Ryde, Mr. Rebbeck being second. The last-named took the premier award for Picotees. Dahlias were finely staged by Messrs. Keynes in the classes for twelve Show, and the same number of Pompons.

Table decorations and bouquets were decided features of the Show. For the most elegantly dressed table 8 feet by 4 feet, Mr. Chard, Brunswick Nursery, Stoke Newington, was an easy winner with a tasteful arrangement in which hardy flowers were conspicuous. Three arches, about 2 feet wide and a yard high as the main feature, were arranged lightly with flowers, including yellow *Marguerites*.

FRUIT.—This was admirably represented, the competition being keen and the exhibits numerous. Five competed in the collection of six distinct varieties (*Pines* excluded). Mr. Inglefield, gardener to Sir J. Kelk, Bart., Tedworth, Marlborough, was first, staging Black Hamburg and Muscat of Alexandria Grapes, the former especially well

coloured, though a trifle small in berry; Tedworth Favourite Melon, large and highly coloured; Walburton Admirable Peaches, Elruge Nectarine and Brown Turkey Figs. Mr. Evans was second; Victoria Hamburg in this collection was very good indeed. Mr. Hall was third. Grapes were numerous shown. For three bunches, black, seven competed. Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rooksbury Park, Wickham, Fareham, secured leading honours with shapely bunches, having good berries and fair finish. Mr. Hall following with Madresfield Court, rather uneven in the size of berry, but good in every other respect. Mr. Inglefield third. For a similar number of bunches any white variety, Mr. N. Molyneux again won with Muscat of Alexandria in very good condition. Mr. Ward, gardener to Earl Radnor, Longford Castle, Salisbury, second with Buckland Sweetwater; Mr. Inglefield third. In the dual bunch class Mr. J. W. Taylor, gardener to T. P. Elphinstone, Esq., Cranemore Lodge, Christchurch, won with a small but perfect Black Hamburg; Mr. Busby second. Mr. Evans in a similar class for any white variety won with Muscat of Alexandria; Mr. Budd following. Prizes were offered for a single bunch of black and white; here Mr. N. Molyneux followed up his previous success by securing both awards, also the silver medal for Muscat of Alexandria, as affording the best evidence of cultural skill in the fruit classes. Messrs. Ward and Inglefield were second in these classes in the order named.

Melons were finely shown. The specimen of Hero of Lockinge which won for Mr. Ward the premier award was simply magnificent in flavour. Mr. Evans was second. In the scarlet flesh class Mr. A. Maxim, gardener to the Hon. Miss Shaw Lefevre, Heckfield, Winchfield, won with Suttons' Al, also good. Mr. Evans was again second. Mr. N. Molyneux secured the leading award for a single dish of Peaches, amongst nine others, with medium sized but highly coloured fruits of Royal George. Mr. Amys, with Noblesse, second; Mr. Wilkins third. Elruge Nectarine, highly coloured, won for Mr. Inglefield the premier award in the single dish class; Mr. Budd following with Violette Hâtive. Hardy fruit in six dishes was numerous staged. Mr. R. West, gardener to J. R. Wigram, Esq., Northlands, Salisbury, easily won. Extremely fine Gooseberries and Strawberries were staged in this exhibit. Mr. Budd was second.

VEGETABLES.—These have never been shown better here than on the present occasion. Any show that secure as competitors men like Messrs. Pope, Wilkins, Inglefield, and Waite are certain of a good display. For nine distinct varieties six competed. Mr. Pope, gardener to the Earl of Carnarvon, Highclere Castle, Newbury, won the premier position with a capital collection. Midsummer Potatoes, Eclipse Cauliflowers, Duchess Pea, Perfection Tomato, Matchless Cucumber, and Anglo-Spanish Onion were the most noteworthy dishes. Mr. Waite, gardener to Col. the Hon. W. P. Talbot, Glenhurst, Esher, second; Mr. Wilkins third. Mr. Waite turned the tables in the class for six varieties (the prizes offered by Messrs. Sutton & Sons) by taking the premier award with vegetables of high-class quality, Golden Rocca Onion, Satisfaction Pea, and Perfection Tomatoes being the most noteworthy; Messrs. Wilkins and Pope following in the order named. For Messrs. Webb's prizes Messrs. Pope, Wilkins, and Waite secured the awards. Potatoes were very good. For eight dishes—four of round and the remainder kidney—Mr. West won; Mr. Inglefield second. The best dish of any round variety was one of Suttons' Seedling from Mr. Waite, and one of Windsor Castle from Mr. Wilkins in the kidney class, both possessing high merit. Cucumbers were well shown by Mr. Busby, Carrots by Mr. Evans, and Peas by Mr. N. Molyneux.

First-class certificates were awarded to Mr. E. Wills for *Bougainvillea glabra*, "Wills' variety," which has smaller flowers than the type but of a distinct purple shade of colour, but the feature claimed for this it that it flowers so freely in small pots; the one staged was in a 48-sized pot and carried eight spikes of bloom. To Mr. Chard for a floral arch; to Mr. F. Sander for *Anthurium Sanderianum* with extra stout flower spathes, one measuring 9 inches by 7 inches and of an intensely brilliant colour. A certificate of merit was awarded to Mr. B. Ladhams for a collection of hardy herbaceous cut flowers. Mr. W. H. Rogers, Red Lodge Nurseries, sent a large collection of ornamental shrubs, and Mr. C. Golding sent well-flowered seedling *Begonias*.

INTERNATIONAL HORTICULTURAL EXHIBITION.

AUGUST 1ST, 2ND, AND 3RD.

THE special three-days Show of Carnations, Picotees, and cottage garden produce, which took place at the International Horticultural Exhibition, Earl's Court, on the above dates was not so good as it ought to have been, considering that such a liberal schedule had been provided. In the open classes some fine Carnations were shown, but the entries were few, and the competition not particularly keen. Fruit, on the whole, was good, but, with the exception of a small section open to market growers, not very plentiful. Vegetables were fairly good in the cottagers' classes, as also were pot plants and annuals, though many of the latter presented a withered appearance long ere the first day was over. The following notes embody the names of the prizewinners in the leading classes.

In the principal open class for Carnations Mr. C. Turner, Slough, was first for twenty-four blooms of not less than twelve varieties. This stand comprised fresh and bright flowers. The varieties shown were Dr. Hogg, Chas. Henwood, Duke of Grafton, Lady Mary Currie, Oscar Wilfred, Dandy, Jessica, Miss Constance, Mrs. J. W. Jack, Colonel Wyndham, Harmony, John Ball, Mars, Robert Houlgrave, Mrs. Barlow, Brutus, Mr. Sutton, and Mrs. H. Cannell. Mr. F. Hooper, Bath, was second with less even blooms; and Mr. Wm. Welsford, Clapham, was

awarded an extra prize. For twelve blooms (amateurs) there were but three competitors, the leading award being secured by Mr. James Portbury, gardener to W. N. Froy, Esq., Putney. The best blooms shown were Reynolds Hole, Grant Allen, Elsie, Earl Beaconsfield, Pomeroy, Alice Ayres, Mrs. Watts, Charles I., Dr. Park, and Grandiflora. Mr. H. A. Fitch, Waltham Cross, was next with small blooms; and Mr. W. T. Willway, Clapham, being awarded an extra prize. For six Carnation blooms Mr. W. Hooper, Chippenham, was first, the second prize being secured by Mr. J. Portbury. Mr. T. Fear was third. The yellow grounds were better. Mr. C. Turner, Slough, was first with twenty-four blooms, comprising not less than twelve varieties. The flowers were very fine. The varieties shown were Adela, Edith W. Wynne, Almira, Mrs. Walford, Countess of Jersey, Magnet, Mrs. Henwood, Goldfinch, Nonpareil, Remembrance, Consolation, and seedlings. Mr. F. Hooper, Bath, was awarded second prize for good blooms, there being no other competitor. For twelve yellow grounds there were also but two competitors. Mr. E. C. Goble, Ryde, was first with grand specimens. The varieties in this stand were James Bennett, Lady Jersey, Old Coin, Lady Sutton, Mr. Henwood, Romulus, Lord Rendlesham, and seedlings.

For twenty-four selfs and fancies, twelve varieties, Mr. Turner was first, showing grand blooms. The varieties were Germania, Romulus, Salamander, Marnie Murray, Victory, Lady Mary Currie, Rose Wynne, Mr. W. Clements, Lord Rendlesham, Iona, The Governor, and King of Scarlets. Mr. F. Cooper was again second, and an extra prize was awarded to Mr. W. Welsford. Mr. C. Blick, gardener to M. R. Smith, Esq., Beckenham, was first with twelve selfs and fancies with a stand of magnificent blooms. The varieties were Eudoxia, Niphetos, Madcap, Violet, Dodwell's 617, Mrs. L. Jameson, Lord Rendlesham, Victory, Germania, Alice Ayres, Marnie Murray (good), Romulus, and Salamander. Mr. W. Hooper, Chippenham, was second, and an extra prize was awarded Mr. E. Cowell, gardener to J. Dondin, Esq., Kensal Green.

Picotees were not very numerous, but the blooms shown were very good. Mr. Turner was first in the class for twenty-four blooms. The following varieties were staged:—Princess of Wales, Lady Churchill, Zerlina, Brunette, Adolphus, Mrs. Harford, Thomas William, Favourite, Lady Gordon Cathcart, Nellie, J. B. Bryant, and seedlings. Mr. F. Hooper was again second; Mr. W. Welsford being third. Mr. T. Fear was first with twelve blooms, including Countess of Jersey, Almira, Mrs. Henwood, Prince of Orange, John Smith, Annie Smith, Augusta, Favourite, and Mrs. Payne. Mr. W. T. Willway, Clapham, was second, there being no third. Mr. W. Hooper was first with six blooms, and Mr. J. Portbury second.

Border Carnations, although few in number, were bright, fresh, and attractive. For twelve bunches, shown with their own foliage, Mr. C. Turner was first, showing grand blooms neatly arranged. The varieties were Almira, Bellissima, Lord Rendlesham, Raby Castle, Charles Henwood, Mrs. Muir, Romulus, Victory, Ne Plus Ultra, Lady Mary Currie, Old Coin, and Queen of Bedders. Mr. Blick was second in this class. Mr. Turner was also first for twelve Carnations in pots, which included grand specimens of Rose Wynne, Duke of Sutherland, Mr. W. Clements, Lady Mary Currie, Romulus, Victory, and King of Scarlets. There was no other competitor in this class. For twelve bunches of self coloured Carnations, border varieties, Mr. E. C. Goble, Ryde, was first, Mr. Hooper being second. An extra prize went to Mr. W. H. Divers, Ketton Hall, Stamford. Mr. Turner was first for six selfs, showing Rose Wynne, Salamander, The Governor, King of Scarlets, Mr. W. Clements, and Lady Mary Currie. Mr. Globe was second, and Mr. C. Blick third.

As has been said, fruit was not very extensively shown. In the market growers' section Mr. Featherby, Gillingham, Kent, was first for a basket of black Grapes, showing grand bunches of Gros Maroc. Mr. Le Poidevin, Guernsey, was second with Black Hamburg. For the best packed basket of Grapes Mr. Featherby was first, Mr. F. Le Poidevin being next. The latter, however, was first for the best packed basket of Figs, and also third for Melons. Mr. Featherby had the best packed basket of Tomatoes. For a shallow basket of white Grapes Messrs. Parsons & Bowyaize, of Covent Garden, were first, the next being Mr. G. Featherby. Mr. F. Le Poidevin was awarded the second prize for a collection of English and Channel Islands fruit packed for market.

Among the miscellaneous exhibits, Messrs. J. Laing & Sons, Forest Hill, S.E., had a magnificent group of plants very effectively arranged. A gold medal was awarded this exhibit. The groups comprised Caladiums, Orchids, Begonias, and Palms. Messrs. Laing also exhibited two "not for competition" groups, similarly arranged to the last named. Messrs. E. D. Shuttleworth & Co. staged a group of flowering and foliage plants, for which a silver-gilt medal was awarded. Mr. T. S. Ware, Tottenham, had a collection of Gaillardias and border Carnation blooms, and Messrs. Dobbie & Co., Rothesay, Violas, Marigolds, Sweet Peas, and vegetables, both securing silver medals. Messrs. Wills & Segar had Palms, whilst Messrs. Jarman & Co., Chard, staged an attractive collection of vegetables, thereby securing a silver medal. Messrs. Barr and Sons were awarded a silver-gilt medal for a collection of hardy flowers.

First-class certificates were awarded to Messrs. J. Laing & Sons, Forest Hill, S.E., for Begonia Charmer, Dendrobium Schröderianum, and Bertolonia Madame von Geert. Also to Messrs. Charles Turner, Slough, for Carnations King of Scarlets, Rose Wynne; Picotees Edith M. Wynne and Lady Emily Van de Weyer.

NEMESIA STRUMOSA SUTTONI.

At the meeting of the Royal Horticultural Society on July 26th Messrs. Sutton & Sons, Reading, exhibited bunches of cut bloom of the above plant, for which the Floral Committee awarded a first-class certificate. It is a half-hardy annual, and the flowers (see fig. 16) are exceedingly pretty. It is characteristic of the plant to produce blooms of different colours, and among them may be found shades of various hues, from a pale lemon yellow to a rich crimson. Messrs. Sutton & Sons inform us that the seed was sent to them from South Africa two or three years ago, and they hope to be able to include it in their list next

FIG. 16.—NEMESIA STRUMOSA SUTTONI.

spring. The seed should be sown in pans or boxes filled with light soil in March or April, and the plants put outdoors in May. They will come into bloom in June, and continue flowering until the end of August.

NATIONAL CARNATION AND PICOTEE SOCIETY.

We were compelled, owing to circumstances, to curtail the report of the Carnation Show (Southern Section) in our last issue, and we now append the details that were omitted. For single blooms of Carnations the prizes were awarded as follows:—Scarlet bizzarres.—First, Mr. M. Rowan with Robert Houlgrave; second, Mr. C. Turner with Dr. Hogg; third, Mr. Douglas with a seedling; fourth, Mr. J. Keen with a seedling; fifth, Mr. Headland with a seedling. Crimson bizzarres.—First, Mr. F. Hooper with Mrs. Cattley; second, Mr. R. Sydenham with J. S. Headderly; third and fourth, Mr. C. Blick with Phoebe; fifth, Mr. W. H. Headland with a seedling. Pink and purple bizzarres.—First, Mr. J. Keen with Sarah Payne; second and fifth, Mr. F. Nutt with William

Skirving; third, Mr. J. Keen with W. Skirving; fourth, Mr. Douglas with Sarah Payne. Purple flakes.—First, Mr. J. Keen with George Melville; second, Mr. C. Phillips with James Douglas; third, Mr. Rowan with George Melville; fourth, Mr. F. Nutt with the same; fifth, Mr. Douglas with Mrs. Douglas. Scarlet flakes.—First, Mr. Douglas with Matador; second, Mr. R. Sydenham with Henry Cannell; third and fourth, Mr. Rowan with Sportsman; fifth, Mr. Douglas with Alisemond. Rose flakes.—First, Mr. J. Lakin with Sybil; second Mr. C. Turner with Lady Mary Curric; third, Mr. Hooper with Mr. G. Cooling; fourth (no name), with Thalia; fifth, Mr. Blick with Thalia.

The premier Carnation in the Show was a remarkably fine bloom of Dr. Hogg, scarlet bizarre, shown by Mr. C. Turner. The flower was richly coloured.

In the classes for Picotees, single blooms, the following awards were made:—Heavy red edge: first and second, Mr. J. Douglas, with an unnamed seedling. Light red edge: first, Mr. C. Turner, with Thomas William; second, Mr. H. W. Headland with Souvenir of H. Headland. Heavy purple edge: first, Mr. J. Douglas, with Muriel; second, Mr. J. J. Keen, with Amy Robsart. Light purple edge: first, Mr. H. W. Headland, with Pride of Leyton; second, Mr. J. Lakin, with Miss Lakin. Heavy rose edge: first, Mr. Keen, with Mrs. Sharpe; second, Mr. Nutt, with the same; third, Mr. Keen, with Mrs. Sharpe. Light rose edge: first and fourth, Mr. J. Douglas; second, Mr. H. W. Headland; third and fifth, Mr. Keen, all with Liddington's Favourite. Yellow grounds: first, Mr. C. Turner, with Countess of Jersey; second, Mr. Henwood; third, seedling, the name of the exhibitor was not given; fourth, Mr. Nutt, with Almira, and fifth with Agnes Chambers. The premier Picotee, as mentioned in our last issue, was a beautiful bloom of Favourite, light rose edge, in one of Mr. Douglas's stands.

Seedlings were fairly numerous and prizes and certificates of merit were awarded to the following:—Homer, crimson bizarre, from Mr. J. Douglas, a large flower, bright in colour; Atrato, purple flaked (Douglas), remarkable for its deep tint of bright purple; Ganymede (Douglas) heavy red edged Picotee; Melpomene, medium rose edge Picotee, very good; Desdemona (Douglas) light rose edge Picotee, distinct; Eurydice (Douglas) a well-coloured yellow ground; Zeno (Douglas) a medium red-edged Picotee; and Lady Wantage, a large white self of fine quality from Mr. William Badcock, Reading.

CHRYSANTHEMUMS AT SWANMORE PARK.

THERE have been logicians holding the quaint position that he who would breed fat oxen should himself be fat. Without at all contesting or favouring this contention, there can be no doubt whatever but that the gardener who sets up as a critic of Chrysanthemums should know very much that is practical and authoritative concerning them. Mr. Edwin Molyneux is a Chrysanthemum critic, and a somewhat severe as well as distinguished one. He has attained to that high position through the exercise of much patience, industry, and skill, having first become a champion grower and exhibitor, then a distinguished judge, and to this latter function he now adds that of being one of the most capable of critics. I can hardly say of him that, having won for himself the highest honours Chrysanthemum exhibiting offered, he did, Alexander-like, weep that there were no other worlds to conquer, for on the contrary he seems to have been amply, nay, even almost more than satisfied with his honours, and, retiring from active competition, left the exhibition area open for other competitors to, if they will, achieve similar results.

But it would be indeed a tremendous mistake were anyone to assume that, because now no longer a Chrysanthemum competitor, the hero of Swanmore Park was no longer a grower. The reverse is the case. Mr. Molyneux grows more plants than ever, and grows them wonderfully well also. There is one secret of the great success which attended Mr. Molyneux exhibiting a few years since as to which he does not attempt to detract one item of merit. It is, that as Swanmore Park lies some 400 feet above the sea level, and is situate on an open breezy district where the atmosphere is naturally much drier than it is in lower localities, conditions favourable to the production of hard mature summer growth is found, which does not always exist elsewhere, and thus it happens that many varieties are at Swanmore much dwarfer than sometimes is the case; the joints are short, the wood hard and sturdy, and the leafage thick and leathery. But apart from this climatic advantage, there is the undoubted fact remaining that only the closest and keenest watchfulness and observation enable a grower to understand fully the needs or requirements of each variety, for Chrysanthemums are wonderfully varied in that respect, and let the natural advantages of a position be what they may, only the closest attention can discover what treatment each variety may require. In all these matters Mr. Molyneux is a master, hence the value of his criticisms.

I was all the more interested in seeing the Swanmore collection of plants, because I have heard it suggested that one reason why the gardener there had retired from the competition field was owing to some

loss of cultural skill. To show how groundless was the suggestion I would aver that it would be very difficult indeed for any Chrysanthemum grower at the present moment to exhibit superior plants to those now growing at Swanmore. I found first a grand lot of the taller varieties standing on each side of a long garden walk, where they were much sheltered from rough winds by trees and hedges. This walk is about 180 feet long, and on each side standing on boards were about 150 plants. In some cases 10-inch pots were carrying two plants, and remarkably well were they doing in such companionship. Indeed the practice seems to be a specially desirable one. On another path was a large number, perhaps 150 more, and then in an enclosed yard having a very hard ash bottom or floor I found standing in rows, 4 feet apart, all the dwarf varieties including Pompons. There were in all about 860 plants, for I counted them for my own satisfaction, and whilst all the best older sorts are grown for comparison, so also are there found very many of the best novelties, including some direct from New Zealand. The latter have not been previously grown in this country, and with respect to their merits Mr. Molyneux will doubtless enlighten the readers of the Journal in due time.

In many cases buds had already been taken; in others they were just developing, and perhaps there is no matter after all in relation to the production of fine Chrysanthemum flowers, that is of such importance as is the taking of the buds at the proper moment. Not every grower perhaps adopts the precaution of placing on the soil in the pots and just before the plant stem a piece of potsherd on which the water is poured; this prevents washing out the soil, as is so often the case when watering is done recklessly, and certainly when over 800 plants have to be watered in hot dry weather there is little time for the exercise of much discretion. An occasional pinch of Thomson's manure had already been given to the plants, but stimulants are not applied lavishly, and certainly not with a free hand until the buds have more largely developed. Enough has been said to show that, now more critic than competitor, Mr. Molyneux has at his disposal ample materials for criticism and judgment; and also, that in no sense has his hand lost its cunning. Swanmore Park lies in no one's way. Everyone who visits the place must go there on purpose, hence not so many see the beautiful gardens as wish. I have found few gardens, even far more pretentious, that better repay a visit.—A. DEAN.

ROYAL HORTICULTURAL SOCIETY.

JULY 26TH.

SCIENTIFIC COMMITTEE.—Present: Mr. Morris (in the chair), Mr. McLachlan, Mr. Michael, Prof. Green, Prof. Church, and Rev. G. Henslow, (Hon. Sec.); visitor, Dr. W. C. Williamson.

Termes at La Rochelle.—Mr. McLachlan having previously stated at the meeting held on June 21st, that the species in question was a native of the Old World alone, though Mr. Warburton is still under the impression that it was introduced to La Rochelle from America; he added the following observations:—"Termes was first noticed at La Rochelle about 1798, and was supposed to have been introduced from St. Domingo, with which place there was much trade at that time. This erroneous idea evidently still exists at La Rochelle as a tradition, having been handed down from generation to generation. A much more probable explanation has been suggested, namely, that it was introduced into La Rochelle with firewood from Landes where it is very abundant. Termes lucifugus has never been found in any part of North or South America, or in the West Indies. In geographical distribution it is essentially circum-Mediterranean, but extends into Spain, Portugal, and as far north as La Rochelle. I possess the insect from several localities on the European coasts of the Mediterranean, and also from Egypt and Algeria."

Dianthus Attacked by Fungus.—Mr. Massee reported upon the specimens sent to the last meeting by Rev. C. W. Dodd, as follows:—"The fungus is *Helminthosporium exasperatum*, Berk. and Br., and is present in various stages of development. As to whether this fungus is the cause of the disease or not it is impossible to say without experimenting on healthy plants. This I am now doing, and will report later. I may add that *Helminthosporium* has been shown to be the cause of disease in other cases."

Bouillie Bordelaise, Cause of its Failure.—The following communication was received from Dr. Russell:—"I send you now the result of my examination of the bouillie bordelaise used at Chiswick. Mr. Barron, I find, took 7 lbs. of sulphate of copper and 10 lbs. of quicklime; he slaked the lime in 10 quarts of water and dissolved the copper sulphate in 7 quarts of water, and afterwards diluted these liquids so as to make the total quantity up to 100 quarts. The clear solution from the lime was added to the sulphate of copper solution, and the precipitate allowed to settle. The Tomatoes were syringed with the clear liquid. The effect has been disastrous, the stems and leaves having in every case been burnt, and the lower leaves had to be removed. Some of the same solution falling also on Vine leaves produced red spots (burns). Now this solution, prepared as above described, was simply a dilute solution of sulphate of copper, containing about one ounce of sulphate of copper in the gallon; so that the whole of the process for preparing the solution was entirely useless, and the product, viz., the hydrated oxide of copper thrown down by the lime, was allowed to settle and was not used; in fact, if you had taken an ounce of copper sulphate and dissolved it in a gallon of water you would have got a solution of exactly the same kind as the one which was used. In the letter from M. Cornu, which you have sent me, I see it is stated that this hydrated oxide of copper is

the active agent, and that the copper ought to be totally precipitated from the liquid. At the same time, I think that the nature and the preparation of this bouillie bordelaise has not generally been clearly stated and understood. I suppose I may assume that this hydrated oxide of copper is the substance which it is desired to prepare, but it will be a matter of the greatest importance as to whether it is suspended in a solution of sulphate of copper, or in lime water, or in pure water; all of which cases are possible according to the proportions of the materials used. In the case of Chiswick there was a deficiency of lime, and hence the copper sulphate remained in solution. To get rid of the sulphate of copper, which appears to have acted so injuriously, the instructions should be to continue the addition of lime till the liquid just ceased to have a blue colour when a depth of 2 or 3 inches is looked through. I should think that the different results which have been obtained by different experimenters may be to a great extent accounted for by the want of an exact description of how the bouillie bordelaise was to be made and how it should be used."

The following are extracts from M. Cornu's letter received by Dr. Masters (from the Muséum d'Histoire Naturelle, Paris):—"The proportions of the bouillie bordelaise vary from 3 to 4 kilogrammes of sulphate of copper, with 3 to 4 of quicklime, and 100 kilogrammes or litres of water [1 kil. = 2½ lbs.; 100 litres = 22 gallons]. It is better to have less copper than lime, so that all of the former may be precipitated. The copper salt must first be dissolved in water (10 litres), and the lime also separately in 20 litres; the two must then be mixed together. Under these conditions the copper is reduced to the state of a hydrated oxide, which is quite or nearly insoluble, and does not burn the leaves. The lime also effects a mechanical adherence of the copper salt to the surface of the leaves. The hydrated oxide of copper becomes soluble under the influence of organic acids contained in small quantities in the liquid in contact with the vegetative organs. There is an elective property in cellulose membranes for salts of copper, and the natural explanation which follows from this fact is; first, that the Peronospora is killed by the salt; and secondly, that the spores cannot germinate upon leaves the membrane of which has imbibed the copper salt. Leaves which have thus received the mixture are not invaded by the Peronospora, while adjacent leaves are less easily attacked. It has been observed in Bourgoyne that the Vines were much less attacked by the Peronospora, the props of which had been treated with the sulphate of copper, than those not so treated. Hence it is advisable to soak all the objects which surround the plants, especially the props or supports, &c., in the bouillie bordelaise, as well as the walls, soil, pots, &c. The author finally suggests the trial of copper sulphide finely pulverised and scattered over the borders, plants, &c." With reference to this last mentioned suggestion of M. Cornu, Professor Church observed that copper pyrites in fine powder suspended in mine water has been proved to be most injurious to young grass in water meadows. Free sulphuric acid and basic sulphate of copper and iron were produced; the acid being the chief destructive agent.

Black Rice from Burmah.—Professor Church announced his discovery of the occurrence of a red pigment in the grain of the Black Rice of Burmah. A sample of this remarkable variety of Rice was recently handed to Professor Church for chemical analysis by the Director of the Royal Gardens, Kew. It was an imperfectly decorticated sample, most of the grains still retaining portions of the dark-coloured pericarp. Plunged into slightly acidulated alcohol the pigment dissolved with a magnificent crimson colour, and proved to be identical with one of the most widely diffused and best known of vegetable colouring matters. This is the compound represented by the empirical formula $C_{20}H_{26}O_{10}$, and known by various names, such as cœnolin, anthocyan, erythrophyll, and colein. It occurs in black Grapes and Black Currants, in the leaves of the Copper Beech, in the stems and leaves of *Coleus Verschaffelti*, in the florets of the crimson Dahlia, &c. It is soluble in alcohol, but insoluble in ether, and nearly so in pure water; and may thus be distinguished from carotin, which dissolves in ether; and from amarantin, which is soluble in water, but not in alcohol. It becomes purple, then blue, and finally green, or even yellow, by the action of alkalis. Its spectrum is quite characteristic. A full account of this pigment was published in the Journal of the Chemical Society for March, 1877.

Figs, Diseased.—Mr. Barron sent some varieties of yellow Figs from Chiswick with dark green spots. Each spot proved to have a scale insect, *Mytilaspis ficus*, in it. The leaves were also affected, but these were neither damaged nor discoloured as was the fruit.

Verbascum, Fasciated.—Mr. Paul exhibited a fine specimen of this plant in this abnormal condition. Mr. Henslow observed that he had several very long fasciated stems of *Asparagus* this year, exceeding 6 feet in length and from 2 to 3 inches in breadth. He also added that he had raised a fasciated *Tropæolum* by seed for six years in succession. *A propos* of hereditary malformations, Dr. Masters wrote to say that although Dr. Hugo de Vries had succeeded in reproducing by seed the spirally twisted variety of the Teazle, yet plants raised by himself from seeds sent to him by Dr. Vries had grown quite normally.

Proliferous Mignonette.—A specimen of this monstrosity was sent by Mr. W. Treceder, Cardiff. It proved to be the same as one issued by Mr. W. Balchin of Hassock's Gate in 1881, and called *Reseda odorata*, var. *prolifera alba*. It was described and figured by Rev. G. Henslow in the Journal of the Linnean Society, vol. xix., p. 214, pl. 32. The peculiarity resides in the fact that every branch arises out of the centre of an abortive flower, and occupies the place of the pistil. Occasionally two branches arise out of the same flower. Each of the branches,

especially the lower, may have lateral ones. These also in the same way rise out of the centres of similarly proliferous flowers. The plant, of course, cannot seed, but can be propagated readily by cuttings.

Vegetable Marrow, Malformed.—Mr. Henslow showed a specimen in which a lateral branch had flattened out, and was adherent to the side of a fruit some 5 inches in length. At the summit of the latter a leaf was given off, as well as another branch similarly adherent to a second fruit of about 2 inches in length. At the summit of this was also a leaf, together with a normal flower bud. In addition to the last-mentioned youngest fruit there was also a second growing from the apex of the first or lowermost fruit. This was about 4 inches in length, quite free, and normal in character. By the side of this was a young branch with leaves, buds, and tendrils, all undeveloped, and apparently quite normal.

The next meeting of the Scientific Committee will be held on October 4th.

HARDY FRUIT GARDEN.

Strawberries.—*Preparing the Ground.*—The end of the Strawberry season having come, regard must be had to forming and planting beds and quarters in accordance with the demand or convenience for growing. It is undoubtedly true that Strawberries succeed the best on a deep, rich, moist, loamy soil, having an open aspect and being well drained. With plants rationally managed throughout the year such soil produces in favourable seasons abundant crops of well-developed fruit, while in untoward seasons, or those with a maximum of heated and dry conditions of the soil and atmosphere, it is only soils of similar texture that can meet the requirements of the Strawberry profitably. Such being the case it is, therefore, imperative that the best preparation of the ground be secured preparatory to early planting. Well-worked gardens are generally in a condition most suitable for forming beds without any great amount of immediate preparation. Ground that has been improved and enriched for early Potatoes is usually in splendid condition for planting Strawberries without further trouble than removing the Potatoes, hoeing down weeds, and levelling the soil. Neither digging nor forking is necessary, especially if the soil is somewhat light. Where these favourable conditions cannot be secured, select, if possible, a plot of ground on which no exhausting crop has recently been grown; clear the land of strong weeds or vegetable stumps; then spread a heavy coating of decayed manure upon the surface, and proceed to dig it in, moving the soil as deeply as possible, at the same time incorporating the whole well together. This method of preparation is fairly well adapted for ground in a medium condition of culture, and which has previously received deep cultivation. Comparatively poor ground ought to receive a more thorough course of cultivation, the best method to pursue in such cases being that of trenching, keeping, however, the soil when dug in the same position as before in order to avoid the introduction of the probably inert soil from the lower spit into the surface layer or rooting medium. This can easily be accomplished by taking out a trench about 2 feet wide to the depth of one spit only, across the breadth of ground, and wheeling it to the end, where the digging will be finished. A good layer of manure is then placed upon the remaining spit in the trench, and it is thoroughly broken up with the spade or fork. A similar width of ground is then marked out for another trench, the first spit of it being disposed on the top of the soil in the first trench, mixing thoroughly with it a fair quantity of well-decayed manure. The same process is repeated over the whole piece of ground. This ensures a rich, open, friable condition of the soil, capable of sustaining the Strawberry in vigorous condition for some years.

Planting Strawberries.—Moderately dry and dull weather is the most suitable for placing out young plants. Those recently rooted in small pots will now be fast filling the pots with roots, and will be in fine condition for immediate planting. If since they became established they have been standing closely together on a moist base of ashes, many of the strongest will be rooting through the drainage holes into the ashes. Preserve all these roots; they can easily be drawn through the holes of the pots when the plants are turned out. Plants also established on turf squares will have many rootlets protruding, showing that they also are ready for new feeding ground. As soon, therefore, this month as opportunity arises, the weather and the soil being favourable, put out all the forwardest plants. Recently trenched ground may require treading evenly all over with the feet, but the operation should only be done in dry weather which has existed long enough to dry and crumble the surface. In planting use a trowel, making holes large enough to admit the roots without crushing or turning upwards, and also sinking the ball low enough so as to bring the crown of the plant just level with the surface. Fill in the soil carefully, making it firm round each plant. Before planting see that every plant has its ball of soil or turf thoroughly moistened through. Should the weather at the time of planting be dry a good watering must be given, following it up if necessary until the

plants are established. A light mulching of strawy manure would, if dry weather continues, be beneficial in conserving moisture, rendering constant watering less necessary. The distances of planting vary with the different varieties; 18 inches from plant to plant and 2 feet between the rows are the nearest distances of planting any of the varieties, while some of the strongest growing kinds may require 30 to 36 inches distance between the rows, affording space of 20 to 24 inches from plant to plant. These distances may seem too much, but it will be found that on richly cultivated ground they are not so, while the advantages of comfortably gathering the produce and attending to the culture of the plants are manifest when they reach in a few years the maximum of their vigour.

Varieties to Plant.—There are abundance of good Strawberries from which to select for every purpose. Where special attention is given to their culture, and every means afforded to enable the grower to give unlimited energy to producing the best crops, excellent results are secured, as well as a long season of fruiting. Sir Joseph Paxton is a handsome, early variety, with fruit of a rich, dark, glossy colour, solid, and of good flavour. It is a strong grower, but unlike some varieties of similar vigour it is an excellent cropper. Those needing a Strawberry which travels and keeps well when sent by post or rail will find this variety equal to any. As a small early variety, but also a good cropper, Black Prince is excellent, and very popular among many growers as a reliable Strawberry. Keen's Seedling is good for forcing, and is also a well-known early variety for outdoor culture. Similar qualities are possessed by Vicomtesse Hericart de Thury, also known as Garibaldi, but it is a greater cropper, the fruit through the large quantities produced being small. La Grosse Sucrée, King of the Earlies, John Ruskin, and Grove End Scarlet are other good early varieties, prolific in bearing, fruit of excellent quality. The last named being small is good for preserving. Laxton's Noble ripens early in the season and succeeds well in some districts, its large handsome fruit commanding a ready sale when first in the market. Though early and large, hence valuable on that account, it is not of the best quality. Moreover, it is a variety liable to be barren if care is not taken to propagate from the best fruiting plants. A good midseason variety is James Veitch, a large, handsome, crimson fruited kind, bearing very freely the second year after planting. It is good, though not of superior quality; some say it is tasteless. Sir Harry is a useful variety of the Keen's Seedling type, bearing large, well-flavoured fruit of a dark crimson colour. President is another leading variety, cropping well, the bright crimson fruit being of superior flavour. One of the sweetest fruited varieties is Dr. Hogg; it produces large, pale crimson fruit. Late varieties include some very excellent sorts, which are worth cultivating, even when the time of ripening is of no importance. British Queen requires superior cultivation, which, being accorded, the fruit produced is large, of fine flavour, firm, and juicy. Sir C. Napier is a remarkable cropper. Frogmore Late Pine is a valuable late variety. The fruit is tender, rich, and of a dark red colour all through. For preserving grow Elton Pine, it is a red-fleshed variety. La Constante is a specially free bearer, one-year-old plants never failing on good ground to produce excellent crops. The fruit is bright crimson, and shapely.

FRUIT FORCING.

Pines.—*Cleansing and Preparing Houses for Plants.*—Thorough cleanliness is essential in fruit culture. All the old plunging material must be removed where the bottom heat is furnished by hot-water pipes, and if tan or leaves be employed for bottom heat they should be taken out, or such part of them that has become decomposed and useless. It is a good plan to overhaul the beds thoroughly at least once a year as a check on predatory pests, such as woodlice, which increase rapidly and commit havoc on the rootlets. Everything in connection with the bottom heat must be put into proper order, but, after clearing out the old materials, wash the wood and ironwork with tepid water and soap, using a brush, and the glass inside and outside with clean water. Brush the walls with limewash. Attend to any repairs and paint the wood and ironwork. Chambered beds are much in advance of those surrounded and passing through rubble either for planting out the Pine plants or for plunging the pots in tan. Beds that are formed of rubble around and over-hot water pipes should be turned over, and any dirt or small parts removed to allow the heat given off by the pipes to penetrate the whole and diffuse uniform temperature to the bed. Fresh material will be required for beds, of which 3 feet depth of new tan is ample, where there are pipes placed beneath. If wet turn it a few times, especially on fine sunny days, but it is best placed in an open shed and turned occasionally.

Re-arranging Plants.—Particular attention must be given to the bottom heat of beds that have been recently upset by the removal of the old material and the supply of fresh, not allowing the heat at the base of the pots to exceed 95° without raising them, as too much bottom heat will disastrously affect plants with fruit or those having the pots filled with roots. Allow every plant plenty of room, as crowding induces a weak growth. Water the plants about twice a week, only when needed, and maintain a moist, genial, well ventilated atmosphere. Pine plants grow luxuriantly at this season, and will not require shading, but do not suddenly withdraw it from plants which were shaded for an hour or two at midday when the sun was powerful through the months of May, June, and July, yet dispense with it gradually so as to give the plants the benefit of all the light possible. Admit air liberally when the temperature reaches 85°, but not to lower it, and keep it between 85° and 95° through the day from sun heat. Afford fruiting plants a night temperature of 70° to 75° and succession 65° to 70°. Suckers for

starting at the commencement of September should, if possible, be reserved on the stools.

Potting Rooted Suckers.—Those started in June, and having filled the pots with roots, should be shifted into the fruiting pots before the roots become very closely matted. Queens require 9 and 10-inch pots, and varieties of stronger growth 11-inch pots. Strong turfy loam stacked long enough to destroy the herbage is the best soil. This, torn with the hand, and a quart of soot mixed with every bushel of compost will grow Pines well. Have the compost rather dry, pot firmly, and keep the plants well down. Water thoroughly after potting, and plunge in a bed having a temperature of 90° to 95° at the base of the pots. Allow the plants plenty of room, as when crowded they become drawn and weakly instead of being sturdy; in fact, there is no greater mistake in Pine growing than crowding young plants.

Peaches and Nectarines.—*Earliest Forced Trees.*—Those started in December and early January will soon part with some of the foliage, but it must not be accelerated by the roots being deprived of moisture; the soil should be kept in a moist yet not a saturated condition, as the latter may cause premature growth, and that must be guarded against. As a safeguard against starting the blossom buds, allow such lateral extension as is necessary to appropriate any excess of aliment, a few green and unripe laterals doing that perfectly. With the trees exposed the rain will not cause premature growth because the air is correspondingly cool, and it has a most beneficial and invigorating tendency. Early forced trees do not usually make strong growth, and they form far too many blossom buds, therefore the pruning needs to be carefully performed, as many shoots are mainly studded with that description of buds with wood buds only at the base and extremity, and it is necessary to retain a wood bud at that point, not cutting back next year's bearing wood unless the shoots are of great length. Where dis-budding has been properly attended to, no more wood being retained than is required to replace the bearing shoots of the current year and to renew worn-out growths, as well as to supply wood for the proper extension of the trees, very little pruning will be needed. Weakly trees require the smaller growths cut out so as to impart more vigour to those retained, for the weak shoots afford much smaller fruit than the moderately vigorous and well ripened growths. Some trees grow too vigorously and must be lifted, weakly trees should have the old soil carefully removed from amongst the roots, supplying fresh turfy loam. Give a good watering both to the lifted trees and to those that have had the soil renewed about the roots. These operations require to be performed as soon as the leaves are mature and before they fall from the trees, syringing the latter and shading whilst the work is in progress, and for a few days afterwards if the weather is bright.

Succession Houses.—Cut away the shoots that have borne fruit, unless required for extension, and all the shoots where the growths are too crowded should be thinned. The foliage should be kept clean and healthy as long as possible. With the freer access of light and air the buds will form perfectly and the wood ripen thoroughly, provided attention is given to a due supply of water to the roots. The house will need full ventilation day and night, and where the roof lights are moveable and the trees not very vigorous, they may be removed when the buds are sufficiently plumped. Where the fruit is ripening a free circulation of air will enhance the quality considerably, supplying sufficient water to the roots to prevent the foliage becoming limp, and secure air moisture by damping available surfaces in the morning and afternoon, as an arid atmosphere favours red spider and the premature ripening of the foliage; dryness at the roots tends to the fruit ripening unduly, and may render it mealy. A slight shade is sometimes beneficial when the sun is powerful and the apex of the fruit fully exposed to its rays beneath the large panes of glass, to prevent the fruit ripening too quickly at the apex, or when it ripens in excess of the demand. Ants are sometimes very troublesome, eating into the choicest fruits. There is no better plan of keeping the pests from the fruit than to place some partially picked bones in their haunts, and when they are preying on the meat place them in hot water. The bait should be dried before using again, and this persisted in will soon clear a house of the ants. They may also be attracted from the fruit by sinking saucers in the ground level with their edges, and as near the stems as practicable, pouring treacle into each saucer.

Late Houses.—The wood is best laid in thinner than is customary with trees in earlier houses, so as to give it a better chance to ripen, and the foliage is certain to assimilate more food and store it up in the wood, whilst the buds are perfectly formed. Attend, therefore, to thinning and regulating the summer growths. Gross growths tend to impoverish the weaker, appropriate an undue amount of sap, prevent an equal distribution of the nourishment, and are seldom fruitful. They mostly fall a prey to gum disease, and are best removed. Strive to secure an even spread of moderately strong short-jointed wood. Ventilate freely in the early part of the day, allow a good heat from the sun through the day, and close in good time so as to run up to 85°. Sun heat will not do any harm after evaporation has been going on for some time, but it is desirable to admit a little air before nightfall to allow the pent-up moisture to escape, and the gradual cooling of the house will ensure rest. Early day ventilation is necessary for the solidification of the growths. Forcible syringings will keep the trees free from red spider, and should be continued until the fruit commences to ripen. Keep the borders well supplied with water or liquid manure.

Cherry House.—The Cherry is liable, when forced year after year successively, to start into growth instead of resting after the buds are plumped, and the leaves are not capable of much further effort in

elaborating and storing matter, therefore any undue excitement must be guarded against by exposing the trees to the full influence of the atmosphere so far as the house will admit. The border must be properly supplied with water, and if the trees are weakly afford liquid manure. Keep red spider in check by an occasional washing with the syringe or garden engine. Black aphides should be subdued by the prompt use of tobacco water, or some other approved insecticide. Trees in pots may be placed outdoors, and must be regularly watered and syringed to maintain the foliage in a healthy condition as long as possible. The pots should be stood on a hard bottom impervious to worms, and ashes placed around the pots.

Vines.—*Grapes Ripening.*—A little air constantly and a gentle warmth in the pipes, so as to insure a circulation, with increased ventilation in the daytime, assists the Grapes in colouring. As these swell considerably during ripening there must not be any deficiency of moisture in the border. Give, if necessary, a good supply, and early in the day, so that superfluous moisture may be dissipated before night. Heavily cropped Vines may have liquid manure, but dressings of superphosphate are preferable, as it excites root action, and should be well washed in. Allow the Vines plenty of time; if there be any hastening of the ripening process and a deficiency of nourishment it is likely the fruit will be deficient in colour. A good rest at night in a temperature of 60° to 65° with air is a great aid to Vines taxed to the utmost by weight of Grapes, but the Vines must have help by day, securing to them a temperature of 70° to 75°, with a moderate amount of air moisture, sprinkling available surfaces occasionally, and if possible allow the laterals to extend, but overtaxed Vines can rarely cater for more than the principal leaves and Grapes. Overcropping is one of the greatest evils in Grape culture, and to prevent disaster in the year following the Vines should have liberal treatment at the roots, so as to secure the proper formation of the next year's crop in embryo.

Late Grapes.—The bunches must have a final examination, removing all the seedless berries, and thinning where likely to be too crowded. Uneven berries and lack of symmetry are great defects, often spoiling the appearance of an otherwise fine bunch. Allow a liberal extension of the laterals, but keep these so disposed that light and air will have access to the foliage equally. Avoid a large reduction of foliage at a time; it only tends to check root action, and has a bad effect on the fruit, very often resulting in shanking and other ills. The inside border will need water frequently, not at longer intervals than once a fortnight or three weeks, but due regard must be had to the necessity for it before applying it. It is scarcely possible to overwater Vines in full growth, provided they are in well-drained borders of porous material and are not too luxuriant in growth. Besides water it will be necessary to give a stimulant of some kind, especially where the crops are heavy. The liquid from manure tanks is suitable, diluting it with tepid water when too strong. Sulphate of ammonia and nitrate of potash in equal parts may be used at the rate of 1 lb. to 30 gallons of water, and about 4 gallons given, after the border has been well moistened with water, per square yard. Guano is a good all-round manure, 1 lb. to 20 gallons of water makes a useful stimulant for Vines. A good handful of the advertised fertilisers per square yard washed in after each watering assists Vines to swell their crops wonderfully. A light mulch of sweetened horse droppings, added from time to time until the Grapes change colour, encourages surface roots, and greatly aids the Vines in swelling their crops.

Cucumbers.—Pot the seedlings for autumn fruiting as they become fit, pinching out the growing point above the second rough leaf of such as are required for growing in pits or frames, but for trelliswork place a small stick to each plant as they advance. Prepare fermenting materials to afford bottom heat to plants in pits and frames. Thoroughly cleanse the structure, cleansing the woodwork with hot water, soap, and a brush, the glass with clear water, and limewash the walls. Remove all old soil, and make all as clean and sweet as possible. A suitable compost for the plants consists of light turfy loam stacked until the grass is dead, a sixth part of old mortar rubbish and a tenth of charcoal thoroughly incorporated. Fire heat is not necessary in bright weather, yet on prolonged dull periods of cold damp weather a low temperature induces stunted yellow fruits, canker at the collar, and mildew on the foliage. In such weather employ a gentle fire heat at night, and by day if dull and cold. Sulphur dusted freely on the foliage is the safest preventive and destroyer of mildew. Canker may be subdued by a drier atmosphere, and rubbing quicklime into the affected parts until dry. Upon a return to bright weather after a dull period shade from bright sun, so as to prevent flagging, which if allowed wastes the energies of the plants, resulting in ill-shaped stunted fruits, and offers a strong inducement to red spider. Attend regularly twice a week to stopping and regulating the growths, and keep up a succession of bearing wood by removing exhausted and replacing with young fruitful growths. Ventilate at 75°, keep through the day at 80° to 90°, and close so as to keep the latter heat with an advance of 5° to 10° well into the afternoon and evening.

THE FLOWER GARDEN.

Carnations and Picotees.—Seedlings are undoubtedly the most easily grown and are wonderfully floriferous, but there is certain to be a percentage of about 25 per cent. single flowering, or otherwise but little valued forms among them. Only the best of them ought to be marked and propagated by means of either cuttings in July and early in August and by layering during the latter month, all choice named varieties to be similarly propagated; and it must be borne in mind that young plants are both more hardy and give better results than old plants.

Layered plants are usually strong and well rooted, and if carefully detached from the old plants in October, and a portion at least placed singly in 4-inch pots and wintered in a cold frame or pit, these, if duly planted out, flower grandly the following summer. Especially ought the somewhat delicate Germania, Pride of Penshurst, and Mrs. Reynolds Hole to be treated in this manner, fewer failures resulting accordingly. Any border varieties that have been flowered in pots can be most readily layered by planting out in a rough frame filled with light sandy soil, or they may be top-dressed and layered into that.

Violas and Pansies.—The former, if properly grown, are wonderfully effective in the flower garden for many months together. They are at their best from April till August, but in some positions and under certain conditions will keep gay still longer. When they fail it is largely due to being planted too late. Instead of being kept till May or June in store boxes or beds they ought to be put out early in April, and there will then be little or no mildew to spoil the plants. Named varieties or any unnamed seedlings can only be kept true by means of cutting-raised plants, and the cuttings need not be put in till October. In order to have strong seedlings of either Violas or Pansies fit for planting out next April the seed ought to be sown now. It may be sown in either boxes or pans filled with fine soil, and these should be placed either in a frame or under handlights at the foot of a north wall. Failing these conveniences place the boxes in a cool position and cover with squares of glass. Keep the soil uniformly moist at all times and shade heavily till the seedlings appear, after which shade from bright sunshine only. Before they crowd each other prick out the seedlings in other boxes or a frame, using light loamy soil, and during the winter protect from severe frosts only.

Antirrhinums and Pentstemons.—If seed of either of these showy border perennials is sown now as advised in the case of Violas, and the seedlings similarly treated, a grand lot of plants will be available for the beds and borders next April. Spring-raised plants are both late and somewhat shy in flowering, whereas those raised in the autumn flower strongly both early and late. They would really survive most winters in the open, but can be more surely wintered in cold frames and without much trouble. The very best varieties of the former, including the pure white form, are best perpetuated from cuttings. Choice or named Pentstemons are also best propagated from cuttings. Short flowerless shoots of either Antirrhinums or Pentstemons taken off now and inserted in sandy soil under handlights or shallow frames, and kept close and shaded from sunshine, will root freely and make good plants for the borders early next spring.

Dianthus and Sweet Williams.—The former are largely raised from seed sown in heat early in the spring, but stronger and better plants altogether can be had by sowing now, preferably in boxes, but if unavoidably so on a border of fine soil. The partial shade and moist position found behind a north wall is also the best place for raising these, and the seedlings may either be pricked out on a warm border or wintered under glass. Sweet Williams to give a good display ought now to be large enough to prick out 9 inches apart each way on a warm or sheltered border, where they are to flower, or they may be put out twice that thickness and two-thirds of the plants moved elsewhere next autumn or spring. If seed is sown now it should be where the plants are to flower, and thinly in drills 6 inches apart.

Other Seeds to be Sown.—If either Brompton Stocks or Wall-flowers are sown at this late date it should be on extra well-prepared ground where the plants are to flower. Sow *Silenes* at once, or the plants will be too small to be serviceable. Forget-me-nots would also have been better raised earlier, but neat little plants may be had by sowing now, especially if this is done in boxes and these given the benefit of frame shade and shelter till the seedlings are growing strongly. In most midland and northern districts the middle of August is a good time to sow a variety of hardy annuals and biennials, but the end of the month answers well in warmer districts. Some of the most serviceable for the spring decoration of beds and borders are Sweet Alyssum, Candytufts, Clarkias, Chrysanthemum segetum, *Coreopsis tinctoria*, Cornflowers, *Eschscholtzias*, Godetias, Larkspurs, *Limnanthes Douglassi*, *Nemophila insignis*, *Saponaria calabrica*, Seabious, Venus' Looking Glass, Virginian Stocks, and *Viscaria cardinalis*. Either sow thinly in shallow drills where the plants are to flower, and they do not move well out of light soils, or else in a sheltered position, transplanting either in the autumn or early next spring.

THE BEE-KEEPER.

APIARIAN NOTES.

FERTILE WORKERS.

AMONGST the last articles the late "Renfrewshire Bee-keeper" wrote to this Journal was on unfertilised queens producing drones and their supposed uses. The late Mr. T. W. Woodbury proved that drones of unfertilised queens or of fertile workers were capable of fertilising. He had one or more queens fertilised by such a drone or drones. But the Punics have enabled me

to solve a greater mystery in the use of fertile workers. Mr. Woodbury, as well as myself, observed eggs in hives having unfertilised queens, and we supposed were laid by them prior to fertilisation; and I recorded a case a few years ago of a queen filling up the hive with drone brood, then after the spring advanced reversed the order of things, and filled it with a worker brood. From what the Punics have shown I am in the belief that we have both been in error.

Being anxious on the 17th of July about my nuclei, I examined them, and No. 1 is what several others' condition were; further than there were many eggs in others, the first one had only seven, six being in elaborately built queen cells, a sign we are apt to take as the queen is *non est*. But here she was, where did the eggs come from? Had the queen been a laying one and caged, theorists would have said the bees transferred them. The practical bee-keeper does not believe in that, nor does he now believe the queen lays eggs prior to fertilisation, but are entirely due to fertile workers. What we have previously looked upon as pests may be as essential as either drone or queen, particularly to bees natives of warm countries. As I have repeatedly proven queens mate at three months old or more, and that drones do not go with swarms. The fertile workers are produced according to Nature's laws to produce drones, and Nature never errs.

But why were these drones produced in royal cells and fed with queen's food? Perhaps to raise to greater perfection, so that the bees would become more powerful as an antidote to breeding. As it stands, it is a great question for naturalists, as it has been a great discovery to the bee-keeper. I am glad to say that one or more of these queens are now laying eggs that will produce workers, and that queens have been introduced successfully where fertile workers are—they do not attempt to kill them.

PUNICS IN DUMFRIESSHIRE.

A rather queer affair has taken place in an apiary at Hightae, Dumfriesshire. A hive of common crosses in spring is now occupied wholly with pure Punic bees. The proprietor could not understand the presence of a curious black bee he had neither seen nor heard of. It appears to me a small stray swarm, or perhaps a queen may have entered the hive from a distance, and meeting a drone of its own species has become the mother of the strangers. As there are no bees near the place of the Punic race, will "A Hallamshire Bee-keeper" say if he has sent any queens near Lockerbie or Lochmaben?

FOCUSSING THEIR SITE.

When bees leave their hive to work in the fields, they always before leaving the alighting board draw their fore legs over their antennæ, or perhaps through the hook of their fore legs. I have observed this for many years, but failed to understand why. Mr. D. Boswell, before alluded to, said his opinion was that it was focussing their position, enabling them to return to the very spot from whence they left, illustrated by the bees returning to the very spot, even although the hive be removed. This theory has a considerable amount of plausibility, because queens leaving the hive for mating do the same, but when swarming neither bees nor the queen do it, hence the reason queens do not return to their hive unless when attracted to it by the sound or smell, and the more youthful bees by following the crowd only.

Bees return accurately to the spot they left if there has been no alteration of the surroundings, but if a hive similar to their own be situated at the end of a row the bees of the outside row will fly to it, the second one in the row to what was the outside one, and if coloured hives have been used and reversed the bees will cross to each other's hives. These facts may seem to some to upset the theory; but it does not, because the eyes and the antennæ work together by some as yet hidden law, besides there

is that mysterious electrical power in the bee which is a factor in its guide of flight, but which also remains to us a mystery.

The many and different formed eyes also have their uses, both in their flight and when at rest, or when in the bosom of a flower robbing it of its sweets, the simple eyes on the crown of its head enable it to see danger, and so avoid its enemies.—A LANARKSHIRE BEE-KEEPER.

* * * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Temperature of Stove (J. C.).—The night temperature of a stove in the summer months should be 70°, falling to 65° in the morning, or even 60° occasionally. In the daytime the temperature should be kept at 70° to 75° by artificial means, on cloudy days but with clear intervals keep at 80°, and in fine weather the temperature through the day should be 85° or 90°, closing sufficiently early each day to raise it to 90° or 95°, or a little more with plenty of moisture. The propagating house must have a steady temperature of 70° to 75° by artificial means, and in hot weather it will probably be 80° to 85°, the shade making the difference between the temperature in that and the ordinary stove.

The Dymond Peach (G. H.).—As you sent a specimen of the growth with leaves, also described the flowers as "large," we have been able to identify the variety. In the absence of such aids the Peaches can seldom be named with certainty. Fruits differ in appearance on the same tree according to the position they occupy. Not long ago we heard a few words exchanged at a show as follows:—"Good morning, Mr. Winner. You were first the other day, but both the dishes of Peaches came off the same tree, didn't they?" "Well," was the reply, "I really couldn't say. The foreman helped in the dishing, and *might* have made a mistake. They were not wrongly named, were they?" There was a curious twinkle of the eye, for the Peaches were not named at all, and that is how the "foreman" dished the judges. The Dymond Peach is a very useful variety, being more hardy than many, also good in size, colour, and quality. It was raised in the neighbourhood of Exeter.

Bedding Pelargoniums Dying-off (G. J. B.).—The Zonal Pelargonium stems contain no trace of any fungi, except such as are found on decayed vegetable matter. The small callosities on the stem and at the joints below ground may have been produced by nematoid worms, which may exist in the soil. The dying-off is not uncommon, especially where the ground has been occupied with the same class of plants several years consecutively. In Pelargoniums, John Gibbons and the strong growers generally are more liable to go off than the compact varieties, and it is most common with "leggy" plants that have a considerable portion of the stem buried to render them dwarf, and where water rests about the stem. A good dressing of lime, say half a bushel per rod (30½ square yards), applied to the beds in autumn and pointed in might do good; but wood ashes would be more useful against eelworms, through supplying sulphates and lime, and they need not be applied until the time of preparing the beds for planting.

Lady Downe's Grapes Scalded (Nemo).—The cause is moisture rapidly evaporated from the berries by the sudden drying of the atmosphere consequent on throwing the house open after it has been kept close and moisture has been deposited on the berries, or it may be caused by the sun heating the atmosphere, and the moisture being so much warmer than the berries, which do not heat as quickly as atmospheric air, is condensed by them, and thus causing injury. The remedy is free ventilation and a little air constantly circulating, so as to prevent the deposition of moisture on the Grapes. A gentle warmth in the pipes, a little ventilation at night, increased early in the morning and admitted freely through the day, is a certain preventive of scalding. Keeping the house closed until 9 A.M. is ample cause of the Grapes

being scalded to the extent of 40 per cent. It is a serious loss, and all the more deplorable as timely attention to the ventilation would have prevented the mischief.

Filmy Ferns and Water Lilies (T. B.).—The answer to your inquiry has been unavoidably delayed. Six good Hymenophyllums are *H. ciliatum*, a native of the West Indies; *C. demissum* and *C. dilatatum* of New Zealand; *H. flabellatum*, Tasmania; *H. hirtellum*, Jamaica; *H. pulcherrimum*, New Zealand; *H. unilaterale*, Scotland; and *H. tunbridgensis*, found at Tunbridge Wells. The following Trichomanes are good—*T. angustatum*, West Indies; *T. radicans* (the Killarney Fern), *T. reniforme*, New Zealand; *T. achilleifolium*, Borneo; *T. alatum*, Jamaica; *T. anceps*, Trinidad; *T. fimbriatum*, a climbing species, West Indies; *T. rigidum*, West Indies and other places; *T. scandens*, West Indies; *T. Yollingeri*, Java. Amongst Todeas the best are *T. hymenophylloides* and *T. Fraseri*, New Zealand; *T. Wilkesiana*, Fiji Islands; and *T. intermedia*, New Zealand. Of Water Lilies you could not do better than grow *Nymphaea alba* and the common yellow form. *N. odorata* (sweet scented) is also hardy; white, tinged with red. This is very much like *N. alba*, and there is another form tinged with pink named *rosea*. *N. pygmaea* is fragrant, white, but a small species. *N. tuberosa* is faintly scented; flowers 4 to 7 inches across, and much after the style of *N. alba* and *N. odorata*. The first is a native of North America, the second Northern Asia, and the third the North-Eastern United States. We do not know where you could obtain the *Nymphaeas*, but Filmy Ferns can be obtained from advertisers.

Ferns for Rockery (A. J. L.).—The following Ferns you will find suitable:—*Athyrium coronatum*, *corymbiferum*, *diffusum*, *Fieldiae*, *grandiceps*, *multiceps*, *multifidum plumosum*, *Pritchardi* and *Victoriae*; *Blechnum Spicant*, *crispum*, *multifurcatum* and *imbricatum*, *Cystopteris Dickiana*; *Lastreas cristata*, *abbreviata cristata*, *grandiceps*, *furcans*, and *Bollandiae*; *Lycopodium alpinum*; *Osmundas regalis* and *cristata*, *Polypodiums*, *Dryopteris bifidum*, and *cristatum*; *Polystichum corymbiferum*, *cristatum*, *curtum*, *grandiceps*, *Haleanae*, *plumosum*, *proliferum*, *Wollastoni*; *Scolopendrium bimarginatum*, *contractum*, *corymbiferum*, *glomeratum*, *flabellatum*, *lacinatum*, *bimarginatum*, *multifidum*, *reniforme*, and *irregulare*. You could plant amongst these not only Auriculas, but Primroses of different kinds, Snowdrops, Scilla siberica, and hardy Primulas of sorts. If not too shady varieties of Iris germanica and Liliums would do well. Small-leaved Ivies such as *Caenwoodiana*, planted amongst the Ferns, would soon give the whole a natural appearance. We do not advise you to place amongst the stones old tree roots; they soon decay and afterwards spoil the appearance of the whole arrangement.

The Fixation of Nitrogen (Student).—You should read an interesting article on this subject in the "Journal of the Royal Agricultural Society" for December, 1891, signed J. B. Lawes and J. H. Gilbert. We make a short extract:—The results of this new series of experiments, taken together with those of the quantitative series, serve further to show that there is intimate connection between the gain of nitrogen by Leguminosae and the development of nodules on their roots. The alternative explanations of the fixation of free nitrogen seem to be—1, That, under the conditions of the symbiosis, the plant is enabled to fix the free nitrogen of the atmosphere by its leaves. 2, That the nodule-organisms become distributed within the soil, and there fix free nitrogen; the resulting nitrogenous compounds becoming available as a source of nitrogen to the roots of the higher plant. 3, That free nitrogen is fixed in the course of the development of the organisms within the nodules, and that the resulting nitrogenous compounds are absorbed and utilised by the host. It certainly seems to us that the balance of the evidence at present at command is much in favour of the third mode of explanation. Indeed, there seems little or nothing in the facts to lead to the conclusion that under the influence of the symbiosis the higher plant itself is enabled to fix the free nitrogen of the air by its leaves. Nor does the evidence point to the conclusion that the nodule-bacteria become distributed through the soil and there fix free nitrogen, the compounds of nitrogen there produced being taken up by the higher plant. It seems more consistent, both with the experimental results, and with general views, to suppose that the nodule-bacteria fix free nitrogen within the higher plant, and that the nitrogenous compounds produced are absorbed and utilised by the plant. In other words, there does not seem to be any evidence that the higher chlorophyllous plant itself fixes free nitrogen, or that the fixation takes place within the soil; but it is much more probable that the lower organisms fix the free nitrogen. If this should eventually be established we have to recognise a new power of living organisms—that of assimilating an elementary substance. But this would only be an extension of the fact that lower organisms are capable of performing assimilation work which the higher cannot accomplish; whilst it would be a further instance of lower organisms serving the higher. Finally, it may here be observed that Loew has suggested that the vegetable cell, with its active protoplasm, if in an alkaline condition, may fix free nitrogen with the formation of ammonium nitrite.

Names of Fruits.—Notice.—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named

must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (F. J.).—The Apple is Early Red Margaret.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing; dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (G. J. B.).—The Fern is *Adiantum Waltoni* if in full growth the fronds attain about 2½ feet in length, including stalks, but *A. æmulum* if the fronds are not more than 15 inches long, including the stalks. *A. Waltoni* is a garden hybrid raised among *A. æmulum*, of which Brazilian species it seems to be a gigantic form.

COVENT GARDEN MARKET.—AUGUST 3RD.

HEAVY supplies now to hand of sieve fruit, realising fair prices.

FRUIT.

ARABLE OR PASTURE?

NOT difficult to answer is the question which this week forms the title of our article, to those who "watch the times," and pay heedful regard to home requirements, which are a safe basis for

the management of every home farm. Given sufficient land for grazing, and the production of an ample supply of corn, roots, and green crops, how can we turn the remainder to profitable account? Arable or pasture, which shall it be? For poor heavy land pasture by all means; but for deep rich soil it is still quite worth while considering if corn, fruit, forage, roots, all or any of them might not be grown for sale. Much depends upon the situation. We should never think of laying down really good soil to pasture within fair distance of a large town. Just see what is possible! Why, even an ordinary crop of Tares, or a growth of Clover, Lucerne, mixed seeds, Trifolium, or Sainfoin is worth £7 an acre on the land as it stands, so that if we include the second crop to be had from at least four of these forage crops there is a certain return of £14 an acre for a comparatively trifling outlay. Or take Italian Rye Grass, and you may realise from four to six times that amount. See that the land is rich in fertility, and the first crop will be ready early in April. It answers best to mow and deliver this, for if sold on the land buyers often delay the mowing and spoil the season. We must be prompt here if we would have four full crops. Apply about 2 cwt. of nitrate of soda as a top-dressing per acre immediately after each mowing, pay no heed to the talk of sleepy folk about scourging the land, but just cram it with manure, grow big crops, hit the markets, and there will be neither time nor inclination to trouble much about depression.

Or to take roots, there are few more profitable crops than early Potatoes, with plenty of good land to be had at from 20s. to 30s. an acre. Here, again, big crops are a certainty with plenty of manure and well chosen carefully prepared seed. Better not touch this crop at all if you cannot comply with these simple but essential conditions. If you can, then the crop may be off the land in twelve or fourteen weeks from the time of planting, and a second crop of autumn Onions, Celery and Lettuce or Autumn Giant Cauliflower follow it at once. All of these crops are easily managed if the land is right; they are all safe crops, and it is worth while remembering that the Cauliflower answers well for sheep folding after the "flowers" are cut, ploughing and ridging for winter following the folding.

Mangolds are a more costly crop, being longer on the land, and requiring much more labour than Potatoes; but it should not be forgotten that on rich land a crop of 40 tons is often grown, which may be sold at the farm for 15s. a ton, or for 20s. if delivered in town. It may, therefore, answer to have an extra field or two of Mangolds when it can be managed without interference with other crops.

Of surplus corn crops Oats are the most generally useful, a really good home-grown sample commanding 9s. or 10s. a quarter more than foreign Oats. Winter Oats have suffered from the extreme cold of the last two winters, but we strongly advise the sowing extensively of this useful crop as soon as land can be had in September. It should not be sown on very heavy or wet land, but on mixed soil or light land, where it winters well, comes early for sheep folding if wanted for that purpose, and gives heavy crops which are usually harvested in July.

Fruit culture on farms resolves itself into two distinct methods, the one being simply an eradication of old worthless trees, and the planting of standard trees of the best sorts as orchard or hedge-row trees; the other plan is to turn one or more fields into fruit plantations, with a mixture of half-standards of Apples, Pears, and Plums, with bush fruits or Strawberries between the trees; or to plant pyramidal or bush trees on dwarfing stocks thickly, so as to have them begin fruiting the second or third year from the planting. The last method costs more than any other for the planting; but, on the other hand, it affords a return more quickly. For example, an Apple plantation of pyramidal trees on the broad-leaved Paradise stock in this, the third year from the planting, had an average of a dozen flower trusses on each tree, and there is sufficient fruit

to render the plantation an attractive sight now. Avoid planting many sorts—a common fault of beginners; rather plant several of each sort recommended for early and continuous cropping, as enumerated in Mr. J. Wright's manual on "Profitable Fruit-Growing." Now is the time to come to a decision about planting, so as to have the land ready by the beginning of November. It must be well drained, if not naturally then artificially, then trenched two-spit deep, or preferably broken up by a steam cultivator at much less expense perfectly well, and for manure we altogether prefer a good mixture of steamed bone flour, mineral superphosphate, and muriate of potash, applied at the time of planting, reserving nitrate of soda for top-dressing during growth in the following summer.

WORK ON THE HOME FARM.

On the whole haymaking was a success, the hay made being really good useful fodder, and not mere dry litter, as so much of it was last year. There is still very much hay about, much not yet cut in the Midlands. It is high time it was off the land now if we would have a good aftermath. Far better make good silage where the weather is broken than a lot of bad hay. The one is cheap and most nutritious food; the other is costly and certainly not nutritious. Ensilage is possible under comparatively moderate pressure, but to have good silage that will keep well air must be excluded from the stack. This is only to be managed by pressure, with which we feel certain of good results. Avoid small stacks; make them sufficiently large to generate heat and exclude air well. The whole process is most simple, inexpensive, and certain. By means of it we avoid the heavy outlay of making hay, cutting, carting, and staking the grass at once. The meadow is cleared, the grass is saved with all its nutriment intact—none washed out of it, and we have a store of sweet wholesome food for next winter and spring, which we can obtain by no other means equally simple and economical.

Bear in mind that the general temperature of the present summer is low, that nights are cold, and rainfall frequent. Calves exposed to such weather cannot thrive as they ought to do, and may be expected in the course of another month to be much troubled with hoose—that trying dry cough which proves fatal to so many young beasts. Prevention is simple and certain, cure difficult and doubtful, leaving behind it a tendency to cold and cough which may occur repeatedly. If you wish to avoid this risk and loss, take in your calves always at night, keep them in on cold wet days, or on very sultry days when gadflies are so troublesome. Continue using your gruel and cake, or crushed corn; see that the building is snug, quite clean everywhere, and well ventilated. Never suffer cattle young or old to lie down upon filthy litter. See that the drinking troughs are cleaned out occasionally. All our drinking troughs are of wrought iron in yards, and out on pasture; they are fed by pipes and a ballcock in an underground cistern from a reservoir and ponds, the iron yields sufficiently to pressure from frost, and the water is always fresh. The troughs are 6 feet long, 18 inches wide, and 13 inches deep.

REMARKS.

- 24th.—Fine, with alternate cloud and sunshine.
 25th.—Generally cloudy in the morning; frequently sunny in the afternoon.
 26th.—Cloudy early; almost continuous sunshine after 9 A.M.
 27th.—Fair, with occasional sunshine.
 28th.—Cloudy early, almost unbroken sunshine after 10 A.M.
 29th.—Bright and sunny throughout.
 30th.—Overcast morning, sunny afternoon.

A fine summer week, with steady barometer, and no rain, no high temperatures, and range generally small.—G. J. SYMONS.

MY ideas of the functions of Grape Vine leaves may not bear the criticism of an expert in plant physiology, and very probably differ somewhat from those generally adopted by gardeners; but all the same, I shall venture to give expression to them. In the course of my remarks I shall most probably touch upon points in Grape culture that have previously been well discussed, though not very recently, and if some of my readers feel disposed to combat my propositions good should result out of it. I believe I am right in supposing that it is generally thought that one of the principal functions of the leaves is the drawing up of sap from the roots and collecting gases from the atmosphere, assimilating and disposing of these largely in the direction of maturing the fruit. This undoubtedly does take place, though not so directly as we are apt to think. The leaves are absolutely necessary for the well-doing of the plant, but is their connection with the bunches so very intimate? I think not. They are by no means such unselfish foster nurses as might be thought; at any rate, their functions lie rather in the building up of wood and a reciprocal action with the roots, the bunches merely sharing in the state of affairs (improved or otherwise) that may be effected by an extra healthy top and root action. I may be wrong, but I cannot help thinking that the bunches, after being developed by the aid of stored-up sap and moisture ascending from the roots, are largely if not solely sustained subsequently by the crude sap ascending from the roots and not that elaborated by the leaves. A strong healthy leaf action, therefore, is needed for the indirect and not direct advancement of the bunches. Without plenty of strong leaves, free of insect pests and mildew, no elaborated sap is available for either enlarging the wood tissues or increasing the vigour and activity of the roots, this naturally reacting on the crops.

It has long been the custom to stop the Vine laterals at the second joint or leaf beyond the reserved bunch, though occasionally this rule is departed from, sometimes in the direction of leaving still more leaves, and occasionally the number is reduced, one primary leaf only being allowed. That the plan of leaving two leaves beyond the bunches at the first stopping answers well there is no disputing; but I like to know the "why and wherefore" of everything, and have experimented with a view to testing the practice thoroughly. Of late years, some of our best Grape growers have adopted the plan, and recommended others to do the same, of leaving more space between the Vines or main rods, the distance being nearer 6 feet than 3 feet, as of old; but the question arises, Are they not going to an unwarrantable extreme, valuable roof space being wasted? I hold that Vines must be very strong indeed to require more than a width of 4 feet, and very many good Grapes are grown profitably, and well too, on rods still closer together. If perfectly satisfactory results attend the practice of stopping two joints beyond the bunches, why go to the length of reserving three or four leaves? Instead of the latter being an advantage they are a disadvantage, as far as the bunches are concerned, always supposing there are sufficient leaves or laterals without bunches on the Vine to promote and sustain a healthy root action.

According to my experience it is possible to leave too many leaves beyond a bunch, for the simple reason that they do not add to the size of either bunch or berries, but rather the contrary. The

leaves would really seem to draw sap away from the bunches rather than feed them directly with it, and if I am desirous of having berries as large as possible, this is brought about by stopping at either the first or second joint beyond the bunch. It is a remarkable fact, but one which cannot be gainsaid, that equally as large bunches and much finer berries can be had by stopping at the joint from which the bunch springs than at either the third, fourth, or fifth joint beyond. Please do not misunderstand me and jump to the conclusion that I am now advocating or even hinting at the advisability of stopping laterals generally close up to the bunches or at the first leaf beyond; what I want my readers to do is to test for themselves whether anything is gained, or as far as the bunches are concerned, whether there may not be a loss in leaving too many primary leaves beyond the bunches.

To a certain extent, and that only, the bunches and berries appear capable of helping themselves to the good things going, but they cannot hold their own against the leaves, whose functions would appear to be more in the direction of laying the foundation of future greatness than the direct maturation of present crops. Thus, if too few healthy leaves are left on a Vine future prospects will be marred, and for reasons already given the present crop suffers also. If we either stop very hard or else early shorten back the laterals any time—say when the leaves are still quite green—the chances, almost amounting to a certainty, are that the bunches produced the following season will be fewer in number and much smaller than desirable. When the greater part of the bunches are cut from a comparatively small Vine early, as they sometimes are for the August or September shows, this entailing the removal of a considerable portion of lateral, the remaining few leaves seem quite incapable of storing up sufficient sap for the spurs to produce good sized bunches the following season. I have a small Vine of Foster's Seedling in a second early house that was originally intended as a supernumerary, but it has repeatedly done such good service that it cannot be dispensed with. Out of seven bunches borne on it last year six were cut for exhibition purposes, and, at the risk of being considered egotistical, I will add that three of them gained the first prize in the any white class other than Muscats at the great Shrewsbury Show. From neither of the spurs from which exhibition bunches were cut were there good "shows" this spring; but in anticipation of this, two of the remaining spurs were laid in to their full length, and the others only lightly pruned, the result being perfectly satisfactory.

By this it will be seen that I am quite alive to the value of good foliage, the healthy exercise of the functions of the leaves being of vital importance in all cases, but there is such a thing as overdoing it. A thin canopy of fully developed leaves is absolutely needed by all the bunches, whether the varieties are black or white, direct exposure to sunshine militating against the colouring of the former, and not unfrequently much disfiguring the white varieties. Light the bunches must have without stint, and that is one reason, probably, why the plan of stopping at two joints, or only one, according to the space beyond the bunch, was originally fixed upon, laterals crossing each other unduly shading everything underneath. Training the rods 4 feet apart meets this difficulty, the laterals on these not being too numerous, and stopped two joints beyond the bunches or left to a corresponding length where no bunches are reserved.

One other point I want to enlarge upon, and that is the class of leaves that may be said to be most generally serviceable. In my opinion none but well-placed primary leaves are of any real service, and by well placed I mean those that get the full benefit of all the light and sunshine possible. In addition to being primary, that is to say, some of the first formed, they ought also to be prime or developed to their full natural size, being also of correspondingly good substance. Late-formed leaves, or any laid in to take the place of primary foliage burnt or lost prematurely in some way, never really compensate for the latter, and I will go even further, and

assert that very much leading and sub-lateral growth that is allowed to develop purposely or carelessly is so much wasted energy. It robs the Vine of much that should have gone towards either building up the stem or supporting and increasing the weight of the crop. By this it will be seen I still disagree with the practice of laying in lateral and leading growths wherever space can be found for it, this including the back walls of vineries, and go to the length of considering it misdirected zeal. Let each rod, whether young or old, be well furnished from the ground to the top of the rafters with strong laterals not more than 20 inches in length, and well furnished with healthy leaves, and the latter will be capable of doing all that is necessary in the way of sustaining root-action and building up increasingly serviceable stems or rods. A portion of the sub-laterals that form must be reserved, removing them all being liable to cause the back buds to push prematurely, but they ought to be kept closely stopped at the first joint, and valued principally as affording a safe outlet for superfluous energy.—W. IGGULDEN.

A SILVER WEDDING CELEBRATION.

WE should like to refer more fully to some interesting circumstances in connection with the twenty-fifth anniversary of the marriage of Mr. and Mrs. Harry J. Veitch—Saturday last, the 6th inst.—than we feel at liberty to do out of respect to their wishes. It is, however, impossible to pass in silence either their own action in connection with our gardening charities, or the action of others who have been impelled to show respect to Mr. and Mrs. Veitch at a noteworthy epoch in their lives. They were the first to express their gratitude for their happy life and attendant prosperity, and this was done, apart from other gifts of a more or less private nature, by the presentation of £500 each to the Gardeners' Royal Benevolent Institution and the Gardeners' Orphan Fund. It is only under the pressure of urgent representations in the interests of those institutions that these grants are now made known. So strong was the pressure on this point, that the donors felt it "would be both selfish and unkind to prefer their own wishes and opinions to those of others who have equally as much at heart the welfare of the institutions in question." We are glad then to register these good gifts, and to recognise the high motive by which they were prompted—a thank-offering purely—and, as will be conceded, appropriately and worthily applied. We could enumerate more; in fact, gifts we have good reason to believe to hundreds of people; but it will be agreeable to our Chelsea friends if we pass to the other side of the question.

In this matter we must consider public requirements as well as private inclinations, and the public would not be satisfied that the Press, to which they turn for information on matters of current interest, had done its duty by a suppression of facts that cannot in any sense be regarded as of a private character. We will first, therefore, briefly enumerate some of the gifts, and then, in respect to one of them, offer a needed explanation.

GARDENERS OF THE UNITED KINGDOM.—Solid silver dessert service (seven pieces), of elegant design; case of one dozen silver dessert knives and forks, case of one dozen silver fish knives and forks, Mr. Veitch's portrait (to be painted and given to Mrs. Veitch).

EMPLOYÉS OF THE FIRM.—Solid silver tea and coffee service (Queen Anne pattern), solid silver kettle and tray, illuminated address.

MEMBERS OF THE BIBLE CLASSES, TEMPERANCE SOCIETY AND CLUB IN CONNECTION WITH THE LACKLAND HALL, CHELSEA.—Large Bible, bound in Russia leather, and lined with silk, with beautifully illuminated inscription, "Presented to Mr. and Mrs. Veitch on the occasion of the celebration of their Silver Wedding by members of the Bible Classes, Temperance Society and Clubs in connection with the Lackland Hall, Chelsea, in recognition of their Christian kindness and sympathy with the work of the Gospel carried on there." Motto verse:—"And now, brethren, I commend you to God, and to the word of His grace, which is able to build you up, and to give you an inheritance among all those which are sanctified."—(Acts xxxii., 20). Also a commentary by Bishop Ryle, 4 vols. The youths of the Club gave an umbrella.

COMMITTEE OF THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Beautiful cloisonné enamel clock and ornaments, with the inscription, "Presented to Mr. and Mrs. Harry J. Veitch on the occasion of their silver wedding, August 6th, 1892, by the Committee of the Gardeners' Royal Benevolent Institution."

FROM SOME OF THE BUSINESS FRIENDS OF MR. VEITCH.—Large solid silver centrepiece or epergne of very elegant design; also solid silver toilet set for Mrs. Veitch.

MANAGERS AND STAFF OF PARK CHAPEL SCHOOLS.—Silver ink-stand, with inscription.

HORTICULTURAL FRIENDS IN BELGIUM.—Bronze figure, bearing the following inscription:—"A. M. Harry J. Veitch, Hommage de L'Horticulture Belge, 1867 le 6 Août 1892." Also a large sheaf of Orchids for Mrs. Veitch. Illuminated address.

HORTICULTURAL FRIENDS IN FRANCE.—Bronze bust of Diana, bearing the following inscription:—"Souvenir Affectueux offert à Monsieur et Madame Harry Veitch à l'occasion du 25me anniversaire de leur mariage par les anciens élèves de l'Etablissement et leurs Amis de France le 6 Août 1892." Also illuminated address.

THE VAN HOUTTE FAMILY.—Large sheaf of flowers to Mrs. Veitch. The numerous gifts from private friends are not enumerated.

The presentations were made to Mr. and Mrs. Veitch at their private residence in Redcliffe Gardens. The display was so imposing that a wish was expressed that it could be seen by a large number of the gardening community, and the question of finding a fitting opportunity for this is receiving favourable consideration.

It may be said that the articles presented by the employés of the firm are of a very massive character, and necessarily of great value. It is noteworthy, too, that the beautifully illuminated address containing the names of the contributors was accompanied by one presented to Mr. and Mrs. Veitch on their wedding day, and twelve of the foremen whose names are there inscribed are also included in the list of Saturday last—a very pleasant subject for reflection and equally gratifying to employers and employed.

The gifts of the Lackland Hall classes and club are particularly valued. The members embrace the poorest, whose habiliments prevented their attending church or chapel in the ordinary way, so a mission hall was provided, and the agencies in connection therewith have done incalculable good.

The clock and ornaments of the Gardeners' Royal Benevolent Institution in pale blue enamel were much admired by visitors, and are highly prized by the recipients.

The silver centrepiece or epergne, convertible into a candelabra, one of the gifts of friends in the trade, may fairly be described as magnificent, the silver supports resembling twisted wood or rustic work rising to a height of 2 or 3 feet; thus the epergne, as richly furnished with fruit and flowers, offers no obstruction to the guests at table.

The continental gifts were characteristic and appropriate. Mr. Charles Pynaert asked the acceptance of the Belgian offerings in graceful terms, and the "sheaves" of flowers presented by him, also that from the family Van Houtte, were such as are not often seen in this country. They were in the form of ladies' sprays, but of such proportions as to cover any ordinary sized lady with floral beauty.

We now come to the last of the presentations of a public nature, though it is placed first in the above list, the gift of the gardeners of the United Kingdom. As hundreds of them knew nothing about it, and must be disappointed in not having participated in it, it is incumbent that the history and procedure pertaining to the gift be briefly explained.

The date of the silver wedding becoming known about three weeks in advance of it, Mr. Peter Blair suggested to Mr. Owen Thomas that something might be properly done by gardeners. The subject was discussed at the Trentham Show, Mr. Thomas by request consenting to become Chairman of a Committee, and Messrs. B. Wynne and J. Wright Secretaries. As it was felt that anything like a public appeal would be averse to the feelings of the Veitch family, all that could be done was to bring the circumstances and proposition before friends by post. Nothing was asked, but an opportunity was simply afforded to gardeners and under gardeners exclusively to join in the movement if they wished, the amounts contributed to range from 1s. to £1 1s., no individual donation to exceed the latter amount. Though all the letters could not be prepared and posted till July 29th, and replies had to be returned by August 2nd, yet in these three days, excluding Sunday, sums amounting to £200 were transmitted to the Treasurer from about 600 subscribers. The action was spontaneous, and the result in the time phenomenal.

The Committee, at a meeting held on the 4th inst., decided to devote half the amount to a silver dessert service, and the remainder to the production of an oil painting of Mr. Veitch, to be presented to Mrs. Veitch, which, of course, remains to be done. A sub-Committee, consisting of the Chairman and Secretaries, with Messrs. T. Baines, J. Hudson, and F. Moore, were appointed to purchase the silver. This was done on Friday last at a cost of £104 3s. 6d., and was presented by them on Saturday, Mr. Thomas reading a short appropriate address, to which Mr. Veitch appreciatively responded, expressing his unbounded gratitude and surprise. The particulars we have given the subscribers (which fairly represent the gardeners of the United Kingdom) have a clear right to have, and it only remains to add that their names, but not the amounts of their contributions, will be inscribed on vellum, with the Chairman's address, and presented to Mr. and Mrs. Veitch, with the portrait, when it is completed.

*LÆLIA MONOPHYLLA.*

ALTHOUGH long known this plant has only been in general cultivation about ten years, it having been reintroduced about 1881. In growth it is unlike *Lælias* generally. It grows in tufts about 6 inches high, the growths bearing a single leaf about 3 inches long, narrow and deep green. The flowers are borne singly, and are $1\frac{1}{2}$ to 2 inches across. The colour is a bright orange scarlet with a purple anther cap. *L. monophylla* is a native of Jamaica, and is found on St. Andrew's Mountain at an elevation varying from 3000 to 5000 feet. It flowers in late summer and autumn. Though not one of the easiest Orchids to cultivate, this little gem merits attention. If grown in baskets in peat and sphagnum and suspended near the glass at the coolest end of the Cattleya house, it should succeed. It does not require an abundance of water at any time, but a sharp look-out must be kept for thrips, which seem to have a particular liking for it. It may be grown in the cool or *Odontoglossum* house, but I should prefer slightly warmer treatment. A well flowered plant may be seen at the present time in the cool Orchid house at Kew.

CATTLEYA SUPERBA.

THE present is about the time for this fine *Cattleya* to produce its flowers. Many growers used to seldom have the pleasure of flowering it, but now that it is better known it can be grown and flowered with greater certainty. Being a native of British Guiana, and found growing on trees along the banks of the swampy rivers of that hot country, it naturally requires heat and moisture the whole year round. It succeeds best in baskets or on blocks with sphagnum and very little peat, and to be grown in the East Indian house near the glass. The flowers are sweetly scented, and of a rosy purple colour, often 5 inches across, and borne from two to six on a spike; the lip is deep purple, and the column whitish. As *C. superba* is never at rest, it should never be allowed to become dry. It was introduced to British cultivation about 1840, but was first discovered by Humboldt in the early part of this century. An example of *C. superba* is flowering in the warm Orchid house at the Royal Gardens, Kew.—C. K.

SACCOLABIUMS.

SACCOLABIUMS form a group as little homogeneous from a horticultural as from a botanical point of view. Botanists separate the *Saccolabiums*, such as we admit them, into several genera. The *S. guttatum* of our culture become *Rhyncostylis*, the *S. giganteum* are ranged under *Vanda*. The species with erect inflorescence are classed either under *Rhyncostylis* (*S. cœleste*) or under *Saccolabium* (*S. curvifolium* and others). From a horticultural point of view I prefer to divide the *Saccolabiums* into two groups, one the species with flowers in pendent clusters, the other the species with erect inflorescence.

To the first group belong *S. guttatum*, *præmorsum*, and *retusum*, all three considered as varieties of the same species. *S. retusum*, *S. Blumei* would only be a synonym of *retusum*, *S. giganteum* (*Vanda densiflora*) and *S. illustre*. To the second group belong *S. cœleste*, *ampullaceum*, *curvifolium*, *Hendersonianum*, and *miniaturum*. Finally, I would range in a third group *S. bellinum* and *bigibbum*, two plants having a quite secondary horticultural interest.

The two great sections referred to afford very different interest from a horticultural point of view. The species with flowers in dense and drooping clusters may be ranged among the most splendid, the richest, and the most aristocratic of Orchids. The houses of M. Linden should have been seen in 1871, at the time when the plants of the Schiller collection were associated there, to gain an idea of the aspect of these plants and of the part which they may be made to play.

As soon as we become masters of the culture of cool house plants, or of *Cattleyas*, we appear to have forgotten the wants of hothouse plants. It is rarely that specimens of the beautiful and brilliant species which our fathers grew figure at present day exhibitions. *Saccolabiums* seem to be no longer desired. *Vandas* are ignored by many amateurs. *Aerides* are neglected, and *Phalænopsis* hardly find favour even with those who know how to cultivate them. People speak of the progress made in Orchid growing. It is an error. Our fathers did not know, or knew little of, *Odontoglossums* and *Masdevallias*; but on the other hand they

cultivated all the other plants as well as, if not better than, we do. I ask to see the large specimens that Thibaut, Linden, Pescatore, Veitch, Williams, Leroy, and Chenu showed with pride. Are there no amateurs among us desirous of reviving that great period? I have myself seen in 1877 a *Saccolabium retusum giganteum* from the establishment of Thibaut & Keteleer, cultivated by M. Chevrier at Rosey par Saint-Désert, having a cluster of more than a yard.

The *Saccolabiums* with erect flowers are far from producing an equal effect to the species with pendent inflorescence. The most beautiful of them is undoubtedly *S. cœleste*. This delightful species was not originally introduced by Roebelen, as indicated in

FIG. 17.—SACCOLABIUM AMPULLACEUM.

Veitch's Manual, but by Auguste Regnier, a sagacious explorer in Indo-China. It was in going in search of this plant, of which he had only sent a few examples, that he was killed in the province of Pursat, in the Cambodge. It was probably from this province that Roebelen introduced it in his turn, as well as the attractive *Phoenix Roebeleni*, which is as common there as *Chamarops humilis* is in Algeria. *Saccolabium miniaturum* is also Indo-Chinese. It is found in Cochin China, in the Cambodge, and in Siam, and I have introduced it on several occasions. *S. ampullaceum* is also represented by a form which I have not introduced for a long time, but which Regnier possessed. Generally considered, all these erect-flowered species are charming, occupy little room, and merit attention.—(L'Orchidophile.)

In connection with the above interesting remarks on *Saccolabiums*, is represented (fig. 17) a prominent member of the erect-

flowered group—*S. ampullaceum*. This is a dwarf, compact, and beautiful Orchid, with dense erect racemes of deep rose-coloured flowers, about three-quarters of an inch across, springing from the axils of the leaves. The lip bears a slender spur of a pale rose hue. The stem is erect, 6 to 10 inches high, the leaves short, thick and channelled, dark green with purple dots. It flowers in May and June, and does well on a block or in a basket near the glass in a warm house.

ABOUT VIOLAS.

(Continued from page 48.)

It is a most healthy sign of the times that in Dr. Stuart's new type of Viola, of which his seedling *Violetta* is the type, we are going back to a close habit, very free in flower, with smaller flowers of good form. Dr. Stuart resides at Chirnside, on the Scottish border, and I saw flowers of *Violetta* and some of his seedlings last year by favour of Mr. G. Steel of Heatherslaw. I have very recently received from Dr. Stuart, whom I have never had the pleasure of seeing, or Mr. Steel either, a box of blooms of his beautiful seedlings from *Violetta*, a distinct dwarf, close-growing variety, with medium-sized white flowers with bright yellow eye, but entirely free from any dark marking in the centre; the flowers are well formed, of good substance, and are deliciously fragrant. This variety will be generally sought after, as will also its progeny in the seedling varieties now sent to me by Dr. Stuart and Mr. Steel, all of which partake of the strongly marked fragrance of the parent variety. Those from Dr. Stuart are as follows:—

Marginata.—A medium-sized flower of exquisite form, substance, and smoothness, creamy white, flushed on the margin with a thin bordering of pale blue lilac. A lovely variety.

Picotee.—White, flushed with a pleasing shade of bright lilac, with the refined form of *Marginata*. Also a lovely variety.

Summer Cloud.—Of the same type, the upper petals clouded with blue lilac, with the same shading in a lesser degree in the lower petals, pale yellow centre. Very pretty.

Blush Queen.—A very refined lovely variety, exquisite in form, of a soft blush tinted lilac colour, with small yellow centre. A distinct and lovely variety.

Springville.—Of similar type to the preceding, perfect in form, of a pale primrose colour, with a deeper tint of colour in the centre. It is very like Dean's *Bridesmaid* in colour, but of the *Violetta* type, and is a very acceptable variety.

These five have the distinctive character of the parent *Violetta*, and I hail these six with intense satisfaction as preserving the tufted habit of the Viola, which I am anxious to see preserved. At present many of our so-called Violas, or Tufted Pansies of some, have far too much of the Pansy breed in them, and are not so floriferous, and continuous in bloom as the true "tufted" form of Viola.

Then Dr. Stuart has other seedlings, in which the *Violetta* type is not sustained. *Sylvia* and *Sylvia's Rival* bear a very close resemblance to the well known and greatly valued variety *Countess of Hopetoun*, and are simply reproductions of that variety so far as the flower is concerned, but no foliage accompanied the blooms, so that I am unable to judge of their habit and distinctness in growth from the *Countess*. *Sylvia's Rival* is the whiter of the two, and Dr. Stuart's *Bridal Wreath* runs very close to both in colour, size, and form, all three having large blooms. I cannot regard either of them as desirable acquisitions by the side of *Countess of Hopetoun*, for nothing can well beat that grand old variety in every respect.

Another of Dr. Stuart's seedlings sent to me is a distinct fine variety of a bright blue lilac colour, free from any central markings; it is named *Blue Gown*, and I think this will be a telling bedding variety. The flowers are large, not of the *Violetta* type, and of good substance, and look as though they would stand wet weather well. In colour, size, and form it is almost identical with a fine seedling in this neighbourhood, of which two large beds exist in full beauty, and have been bright and gay from April. It is a seedling from *V. lilacina*, a good old variety, but with a constitution not sufficiently strong to stand hot weather. The seedling has a stronger constitution, and is of close habit, three or four days of almost tropical weather not having affected it, while two large corresponding beds of *lilacina* showed marked symptoms of the heat. I had thought as a name for it *Summer Cloud*, but Dr. Stuart has forestalled me with this name for one of his lovely *Violetta* seedlings, so the other still remains unnamed. It is a source of great pleasure to me that the Viola has become so immensely popular as a garden decorative plant. It has been uphill work to make it so, and those who have all along stuck to the Viola and championed its cause have now their reward.

Immediately upon the receipt of Dr. Stuart's box of flowers, others came from my old correspondent and enthusiast in good floral work, Mr. George Steel, of Heatherslaw, and it may interest many to know something about them. I will first take the shades of yellows—viz.,

Beauty of Heatherslaw (Steel).—A medium-sized flower of beautiful form, stout, smooth, and entirely free from any ray or marking; a pure self of a rich yellow colour. I was so struck with the similarity of this seedling with my *Golden Circle*, that I at once gathered flowers of the latter for comparison, and I could see no difference only that one might be a trifle more yellow than the other. At all events, they are not distinct in colour and ground, and as my *Golden Circle* is in the hands of others also, it should take precedence over the *Beauty of Heatherslaw*, not yet sent out. My *Golden Gem*, and Mr. Loudon's *Roths*, sent out by Messrs. Dobbie & Co., are of the same type, and very much like a beautiful variety, *Queen of Spring*, which I introduced into notice ten or eleven years since. In fact, *Roths* is simply *Queen of Spring* again or scarcely distinct from it. All are lovely pale or deeper shaded yellows, pure self, and without an atom of marking in the centre.

Venus (Steel) is a counterpart of Dean's *Bridesmaid*, but a little deeper in colour; a pure self, entirely free from any marking and a very desirable variety.

**Ophir (Dr. Stuart)*.—Deeper in colour and smaller than *Springville*, already described. Bright yellow blotch with paler margin.

Marquis of Waterford.—This is of the old *V. lutea* type, small flower, a close short-jointed habit, and a most profuse bloomer; bright yellow with rayed centre. Mr. Steel thinks most highly of this variety as a bedder, and from what I see of its habit in my garden from plants sent to me in the spring by him, it is a most useful dwarf yellow variety. It is certainly an improvement on the old *V. lutea*.

White's Border Queen.—We have the Pansy breed visible in this variety; bright yellow margined with deep blue lilac, but with a small blotch in each side petal and a rayed lower petal. Mr. Steel says it is a seedling from *Skylark*. It is pretty, and will please many, but I do not care for it as an acquisition, and it is a reproduction of an old Pansy of fifty years since.

**White Lady (Dr. Stuart)*.—A very pretty white with small lemon centre, good form and substance, and very pretty.

**Mrs. Joseph Oliver (Steel)*.—A little gem of exquisite form, almost snow white with a very small yellow eye.

**Violetta (Dr. Stuart)*.—The original of the type is white, slightly clouded with blush, and distinct yellow centre. It is deliciously fragrant, which is also a characteristic of the seedlings.

Sylvia.—Already described in Dr. Stuart's sending.

**Maggie Steel, Mrs. George Finlay, and White Lady*.—All Steel's seedlings. They are very much alike and all very pretty, but we scarcely need all, certainly not as distinct varieties. *Maggie Steel* is very pretty, pale creamy white with yellow centre, and *White Lady* may be the best and the whitest. Mrs. George Finlay is smaller and has more cream colour in it and is very pretty. This ends the whites.

Nina.—Of medium size, exquisite form and of good substance, bright in colour, striped and clouded violet purple and rosy lilac, distinct and good, a welcome acquisition.

**Picotee (Dr. Stuart)*.—A lovely variety already described.

**Summer Cloud (Dr. Stuart)*.—Already described.

**Mrs. Stevens (Steel)*.—Deep lilac with a lighter shade in the lower petals and large creamy white centre, with small yellow central blotch, very pretty and deeper in colour than *Blush Queen*.—W. DEAN.

LETTUCE FOR AUTUMN AND WINTER.

ANY time during the month of August is good for making a sowing of Lettuce seed of both the Cabbage and Cos varieties for an autumn and winter supply. I have found ground from which early Potatoes on sheltered borders have been dug suitable after applying a top-dressing of soot, forking over the ground and otherwise preparing the soil by raking it level and making it fine for the seeds. When the ground is ready draw the drills 1 foot apart and sow the seeds evenly, afterwards covering them with fine soil. I like to make a sowing the second week in August, also another at the end of the month. It is a good plan to fix some forked sticks or a sort of trellis of wood over the beds to support a net for preventing the birds taking the seeds, as the finches are very fond of Lettuce seeds.

If a large supply of Lettuce is required prepare other vacant ground, and when the first seedlings are sufficiently large to handle

*Those marked * are all *Violetta* seedlings.

thin out the drills, and transplant the seedlings 1 foot apart each way, taking care to leave in the seed drills plants 9 inches to 1 foot apart for a first supply for cutting. The transplanted Lettuce will supply useful salads later on. I have generally planted Lettuce from the seed beds on different aspects—viz., a south and a west border, and by due attention to keeping the soil open and the ground clean have generally succeeded in maintaining a successional supply. Where cold frames can be had it is a good plan to fill them with plants from the late sowing.

I have found Stanstead Park for a Cabbage Lettuce and Hicks' Hardy for a Cos variety everything to be desired as to hardiness. With proper care they have never failed me, enduring the hardest and most severe winters. The above are good old varieties, and can be thoroughly depended upon if the seed is obtained true. All the Year Round, Hammersmith, and Black-seeded Bath Cos are also good varieties for hardiness. I have penned these lines mainly for amateurs, who often take a great deal of trouble to get a supply of serviceable Lettuces and Endive (which requires the same treatment except as to being blanched), but who too often fail in their attempt. Dry fern is useful to protect the Lettuce from very hard frost and east winds.

Now that we have such beautiful and quick turning in Lettuces as Early Paris Market, Golden Gem, and Perfect Gem, which can be had so quickly, it is hardly worth while taking the trouble to plant out for spring use. If seed of the above is sown during the winter in a warm house in boxes or pans, and the seedlings thinned out and transplanted into other boxes at regular intervals, a good supply can be provided. Shelves near the glass or by the side of the walks are good places to stand the boxes in the houses.

Should anyone not have the convenience of glass for a spring supply, Stanstead Park and Hicks' Hardy will not fail them in the spring if properly attended to. No doubt other gardeners can mention other sorts they have proved to be hardy. By so doing they will confer a benefit on the community.—JOHN CHINNERY.

NOTES ON FORCED FIGS.

THE earliest forced trees will soon be cleared of their second crop—indeed, the very early varieties are cleared of the fruit, and would perfect, if allowed, a third crop with little trouble. This they must not be permitted to do, for it is not only a severe tax on their energies, but renders them practically useless for producing a full first crop next year. All the fruit, therefore, that shows after that reserved for the second crop should be rubbed off, and this will cause other Fig buds to develop at the same joint, but not become conspicuous until the close of the season, and these, with those formed near the points of the shoots, form the first-crop Figs another season, and are very much the most important crop. When the fruit is all gathered the main point is to secure the proper maturation of the growths, and if due attention has been given to stopping and thinning the shoots little will now be required, except attention to ventilation and watering. The syringe must be laid aside, except for the purpose of giving an occasional forcible washing to cleanse the trees of dust and red spider, and if scale is troublesome remove it with a brush moistened in a solution of softsoap, 3 ozs. to a gallon of water. The growths must not be stopped, but they should be thinned where crowded. Future crops depend entirely upon the ripening of the wood, therefore maintain a circulation of dry warm air until the leaves die naturally.

If the trees have roots extending beyond the pots into the plunging material or fermenting bed they should be cut off a few inches of the pots, using a sharp spade. This will check any tendency to continued growth, and cause the points of the shoots to concentrate the energies on the formation of embryonic Figs at the axils of the leaves. That is what is wanted—thoroughly ripened wood well studded with Fig buds scarcely discernible. Trees not having the roots much outside the pots, and not growing, but having the wood well ripened, may be placed outdoors in a sunny sheltered situation. They must not become so dry at the roots as to prejudicially affect the foliage, then the open air influence will do much to invigorate them and harden the wood. Under no circumstances, however, must they be put out whilst the growth is immature, for in that case they must be continued under glass, and every care taken by full exposure to light, a free circulation of air, and no more water at the roots than sufficient to keep the foliage healthy to secure the complete maturity of the wood.

Trees that ripened a first crop in June will now have the second crop advanced for ripening, and to insure fine fruit should be liberally supplied with water or liquid manure if carrying a heavy crop and the trees are weakly, but the manurial applications must not be of such a nature as to cause continued growth in the trees, for it is important to have the wood well ripened, so as to secure a

full first crop another year, and over-luxuriant trees should be marked for lifting. A mulching of short material will do much to accelerate the finishing of the crop by keeping the soil regularly moist, also by encouraging roots and a full supply of nourishment. When the fruit commences to ripen water must be withheld from it, therefore strive to have the foliage free from red spider by forcible syringing, so as to expel it where it has obtained a footing. Afford a free circulation of air, and in cold wet weather a gentle warmth in the hot-water pipes is necessary to maintain a warm rather dry atmosphere, without which Figs can hardly be had in perfection.

The fruit in late houses from which one crop only is taken will be advanced for ripening, therefore spare no pains to have the foliage free from red spider, syringing forcibly. Feeble squirts neither break up the webs nor expel the mites. They are worse than useless, and constant bedewings do more harm than good. One thorough washing is worth any number of dampings from an insecticidal point of view. Afford due supplies of water or liquid manure to the roots. A light mulching of lumpy manure assists the perfecting of the current crop and the formation of Fig buds for another season. The fruits that are now green and part swelled only are of no use for another year, as late house Fig trees only mature the first crop, therefore these incipient second crop Figs should be removed, and then other buds will form by the side of where they have been, and a splendid crop of fruit be had the following season. This is too little attended to in Fig culture; trees are burdened with a second crop that can never ripen, and the only crop that could be often rendered practically nil through the exhaustion of the wood on premature fruit. A second crop can be had by starting the trees earlier—say in February, and then they will ripen a first crop in late June or early in July, and afford a second crop at the end of summer, often as late as November, Negro Largo being a grand fruit late in the season. The finest fruit is the first crop, though often the scantiest, but good fruit of both may be had by judicious and timely thinning. White Marseilles and Brown Turkey are perhaps the best all-round first and second crop Figs. For a late supply Col de Signora Bianco, Nebian, and Agen should be grown, as they are unsurpassed in quality, but in most seasons they require fire heat to ripen the fruit. Avoid wetting the fruit after it commences ripening, and keep the growths rather thin alike for the benefit of the fruit and for the thorough solidification of the wood for future crops. Stop side shoots at the fifth leaf, but do not encourage too many of these spur-growth, for they are liable to crowd the trees, and it is important that all the growths, especially their points, and late in the season be fully exposed to light.

Young trees in pots from this spring cuttings and intended for fruiting in the second or third year of their growth should be trained with a clear stem, not allowing any suckers on any account. Take out the point of the shoot when a few inches high for dwarfs, but for standards they must be trained with a single stem until the height required is attained and then be stopped. Pinch off the tops of strong shoots to form the foundation of a symmetrical head after side growths are originated, and rub them off to the height of stem required.—G. A.

IMPATIENS.

THESE beautiful flowering plants are extremely useful for furnishing the stove and greenhouse, also for purposes of general decoration; and considering their comparatively easy culture one might expect to see them grown on a much more extensive scale than is usually the case in private establishments. Another important point in their favour, provided proper attention is bestowed upon them, is their freedom of flowering, as they can be had in beauty all the year round. The stove and greenhouse varieties may be propagated from cuttings at almost any season of the year. Care should be taken to select strong healthy shoots, as they root more readily and form useful plants much more quickly than do weakly cuttings. They are best inserted singly in small pots and placed in a close propagating frame, where they must be shaded from the sun. When rooted they should be somewhat restricted at the roots by only allowing very moderate shifts. Useful decorative plants may be grown in 6 or 8-inch pots, and they usually succeed better in these than in larger sizes. A sound rich porous soil suits them admirably.

Impatiens Sultani is without doubt one of the most useful of the family. It is of a neat compact habit, and almost a perpetual bloomer. Small plants with their brilliant scarlet flowers are most effective for decorative purposes, especially for the dinner table and drawing-rooms. It is quite at home in a stove temperature, and also does very well in the greenhouse during the summer months. Impatiens flaccida alba, although not so neat in habit as

Sultani, is nevertheless well worthy of a prominent position, its pure ivory white flowers, which are produced in great profusion, making a pleasing contrast to the bright scarlet of Sultani. It is frequently met with in gardens under the name of *Impatiens Sultani alba*.

Impatiens Hawkeri is a very useful and showy variety and should find a place in all collections of stove flowering plants. It is of free growth and good habit; but, unlike the preceding varieties, it requires a liberal amount of pot room. Young plants that are well rooted in 60's may safely be potted into 24's, provided careful attention is paid to the watering, till the roots are well established in the new soil, when they must never want water. This variety seldom requires to be stopped, as it naturally breaks all down the stem, forming dense and compact specimens in a short time. Its flowers, which are produced freely, are large, and of a rich carmine colour encircling a small white eye.

Impatiens Balsamina (common Balsam) is a popular favourite with all classes; yet, although of comparatively easy cultivation, good blooms and well grown plants are far too rarely seen. Seeds should be sown about the middle of March, and not later than May, in properly prepared pans of rich sandy soil, and placed in a gentle bottom heat of about 65°. As soon as the first rough leaves are developed the plants should be placed in 3-inch pots, care being taken to keep the seed leaves close to the soil. As soon as the roots reach the sides of the pots the plants should be shifted into 6-inch, and then finally into 8-inch or 10-inch pots. The plants require all the light possible, and ought to be turned around frequently so that they do not draw to one side. A gentle sprinkling with the syringe at closing time is very beneficial to them till they commence flowering. The soil must be light and rich, and plenty of drainage allowed, as the amount of water required after the plants are well rooted is very great. If they are liberally supplied with liquid manure they will continue in beauty for a long time.—G. PARRANT, *Ashby St. Ledger's Lodge, Rugby*.

COMMON ASPARAGUS FOR POT CULTURE.

It sometimes happens that useful hints are picked up in apparently the most unlikely places, and by cultivating our powers of observation we often see things which might otherwise pass unnoticed, and which, when retained in the memory, prove valuable aids to success in cases of peculiar difficulty if not in everyday practice.

About two years ago I was walking down one of the many narrow busy streets of London where hundreds of commodities, extremely varied in character, provided a brisk trade in the open air. Of course, the itinerant hawker of plants and flowers figured among the number, shouting in eulogistic terms of the beauty of his wares, which were "a-growing and a-blowing." I was much struck with a batch of remarkably pretty Fern-like plants in 3-inch pots, and in the distance could not discern what they were. Closer inspection clearly showed they were seedlings of the common Asparagus, sown thickly and grown to a height of about 9 inches or a foot. Here, I thought, is a hint well worth acting upon, for I could conceive few things more useful for house decoration than a large batch of similarly well-grown and pretty plants. Since then I have grown many batches, which have fully borne out my opinion as to their great value. For arranging in small groups, jardinettes, or baskets they are extremely useful, and large plants are effective when placed singly in vases. I have just sown a good batch in 3-inch pots. These will be ready for use by the end of October and November, a time when small Ferns are not generally plentiful. Another sowing made early in spring will provide plants for use during the summer months. If required several sowings might be made during the spring and summer to keep up a regular succession of young plants. I sow about ten or a dozen seeds in a pot, and do not thin the young plants. The soil used is two parts loam and one well-decayed hotbed manure, with a little soot added, and in this compost they grow well and keep good in colour. Those from the present sowing are grown in cold pits till frosty nights set in; then they will be kept near the glass in a greenhouse temperature. Sowings made early in the spring should, of course, be kept for a time in a gentle heat, and afterwards transferred to a greenhouse shelf or cold pit.

Plants which have matured a season's growth, if cut down and potted in the spring, make good clumps in 6-inch pots the same season. I have grown a few in this way, and have found them useful; but I consider this Asparagus is better adapted for using in small pots as above indicated, so that when they have done duty in dwelling rooms or entrance halls the majority of them may be consigned to the rubbish heap, reserving a few of the most

promising potfuls for growing another season. By working on these lines a great quantity of useful decorative material may be obtained from a limited amount of glass.—D.

JUDGING HERBACEOUS FLOWERS.

IN view of the fact that herbaceous perennials are now so frequently exhibited, is it not desirable that some principles should be agreed upon for the guidance of exhibitors and judges? Without some principle to go upon it is most difficult to decide between rival stands of anything like equal merit, and the decision when arrived at is not likely to give satisfaction.

We have had a class for these flowers here, in connection with our Rose show, for many years; offering prizes for thirty-six varieties, twenty-four varieties, and twelve varieties, which have year after year brought excellent competition. We think we have learnt by experience some things as to the best way of showing herbaceous flowers, and something also as to the way in which they should be judged. We have found that no two judges are agreed as to which flowers are good and which are common; we have therefore adopted "beauty" as the simple criterion, asking also, of course, that all flowers shall be shown in the best possible condition, and be the finest of their class. We also require that they shall be well and tastefully staged. The instruction in our schedule runs thus, "In judging the herbaceous section, beautiful flowers and effective arrangement will be preferred to mere rarity."

We encourage such staging as will show as far as possible the habit of each flower, and for this purpose the stalk should appear, or as much of it as may be required. We discourage mere "bunching," while we like to see a sufficiency of flowers in each tube; we like each flower and each spike to be so far separate that the judges may discern its excellencies or defects. The "bunching" system, while it makes a great display of collective colour, deceives the judges by tying together small spikes (say of Lily or Phlox) and producing the effect of a good spike; it deceives also the public, for whose instruction chiefly our flowers are exhibited. There should, however, be some understanding as to the showing of varieties of the same class. Of course there are certain things of which you cannot show varieties in the same stand without loss—e.g., Delphiniums and Phloxes; but does this hold good with such things as Lilies and Campanulas, which differ from each other so much not only in colour, but in form? I should like to elicit some expression of opinion on the points I have raised.—L. GARNETT, *Christleton, Chester*.

FLOWER GARDENING IN LONDON.

SUMMER flower gardening should now be in the zenith of its beauty. It is seldom that the plants become properly developed and full of blossom ere the summer is half over, and oftentimes August has set in before the beds are well filled. Such is the case this year. A long spell of cold dull weather during last month retarded the growth of tender plants, and prevented others blooming so freely as they otherwise would have done. This is most noticeable in several of the parks and public gardens in the metropolis. Notwithstanding the skill brought to bear upon the bedding, many of the beds this year present rather a bare appearance, which can only be attributed to the weather. Happily, however, these are exceptions, not the rule. In some instances more freedom and greater variety are noticeable than in former years, whilst the employment of hardy plants indicates other changes in the near future. Public taste has to be gratified in the parks, and it is therefore in such places that the most progress in flower gardening is generally made. Each year, I am glad to note, brings some improvement, and less of the stereotyped arrangements which were so fashionable a decade or so ago.

HYDE PARK.

For summer bedding this park has long been famous. The series of beds that run parallel with Park Lane are, as a rule, most elaborately planted, and usually attract considerable attention. This year is no exception to the rule. The beds, perhaps are not quite so gay just at present as they sometimes are, but a few days' bright sunny weather will improve them wonderfully. Still, they are even now well worth a visit. Among them may be found a great variety of combinations of colour such as are rarely seen in private gardens. Some form vivid contrasts, others quiet and pleasing harmonies. Here we find a bed filled with gay Pelargoniums, and edged with Lobelia or Pyrethrum in the ordinary manner; there may be seen some planted with graceful habited foliage plants, relieved by the daintiest of colours, such as Plumbago capensis, Heliotrope, white Lilies, and delicately tinted Violas; all are good in their way, and each has its respective admirers. The enumeration of the most noticeable combinations might be interesting.

Entering the park by Stanhope Gate the visitor is at once attracted by a number of beds filled with Zonal Pelargoniums and Violas. One bed, oblong in shape, is very showy. The centre is planted with Pelargonium Mrs. Morris and Viola Blue Bell, and around these are rows of

Coleus Verschaffelti, *Pelargonium Princess Alexandra* (variegated foliage), the edging being *Lobelia pumila magnifica*. Near to this is a very pretty combination. The body of the bed is filled with pink *Pelargonium Titens* and blue *Violas*, the other portion being planted with light-leaved *Robert Fish Pelargonium*, *Coleus*, and white *Lobelia*. In the background is a group of dark-leaved *Cannas*, which add to the effect. An uncommon bed is that of dark *Fuchsias*, *Lilium candidum*, *Petunias*, herbaceous *Lobelia Queen Victoria*, and the *Canary Creeper* (*Tropæolum canariense*) trained on stakes, the groundwork being filled in with pale blue *Violas*. This may seem a strange combination, but the effect is good. The white *Lilies* contrast well with the tall dark *Fuchsias*, heavily laden with bloom, whilst the *Tropæolums* add their own peculiar charm.

Tuberous *Begonias* are largely employed, but the plants do not seem to have grown so vigorously as they usually do. In most cases, however, they are flowering grandly and do not present that washed-out appearance which in dull seasons is characteristic of the *Zonal Pelargonium*. One noticeable feature in the bedding at Hyde Park is associating *Violas* with *Begonias* and *Pelargoniums*. The delicate hues of the first tone down the vivid colours of the two latter, and the result invariably is a charming effect. A small bed planted rather sparsely with *Begonias* and blue *Violas*, the ground being covered with *Lysimachia Nummularia aurea*, and edged with *Iresine* and *Lobelia Blue King*, is exceedingly pretty. Near to it are clumps of a small dark crimson climbing *Tropæolum* planted on the turf and trained on stakes. These are most effective, and might with advantage be imitated. Similar masses of the same *Tropæolum* are disposed in a large bed filled with clumps of white *Liliums*, *Cauterbury Bells*, white *Petunias*, and tall *Abutilons*, the ground being covered with blue *Violas*. The effect is excellent. The plants are not too crowded, but fill the space comfortably, and their graceful character contrasts pleasantly with the more formal beds hard by. Near this another bed similarly planted is likewise good and out of the common. Here we find the blue and white form *Campanula pyramidalis* disposed over the bed, and between them clumps of dark *Lilies*, tall yellow *Calceolarias*, and masses of a white summer flowering *Chrysanthemum*. Many visitors stop to look at this strange but effective bed, and the large plants of *Plumbago capensis* in the background.

Fuchsias are always a feature in Hyde Park. Besides being extensively used for the beds large specimen plants 4 or 5 feet in height are disposed in groups on the turf, the pots being sunk below the surface. This plan is a good one, and those responsible for the summer decoration of private gardens might utilise *Fuchsias* in a similar manner. Given proper attention as regards watering they flower most profusely, and produce a good effect. The free growing varieties and most profuse bloomers are best adapted for the purpose, and these are conspicuous in Hyde Park. Mrs. Marshall, *Arabella*, *Earl of Beaconsfield*, *Henry Brookes*, and *Tower of London* are the favourite varieties there, some grand specimens of these laden with blooms making an imposing display. Ivy-leaved *Pelargoniums* are also employed with good effect. Large specimens are disposed in beds, also in groups on the turf, the plants being retained in their pots, which are plunged below the surface. *Zonal Pelargoniums* similarly grouped and plunged were also very striking. Treated thus the plants are less vigorous in growth, but certainly more floriferous than when planted out. Many of them are covered with bloom, the trusses, too, being remarkably fine.

Mixed beds are of course numerous. It is pleasing to note this fact, inasmuch as it is a sign that the departure from conventional methods is still progressing. Time, no doubt, will bring further changes. Hardy plants are in some instances interspersed with those of a more tropical nature with good results. White *Carnations* and light coloured *Picotees* blend well with brilliant *Begonias*, and early flowering *Chrysanthemums* make very effective beds. In due course we may see beds of the old crimson *Clove* and other *Carnations*, they being among the best of town flowers. And why not? *Pentstemons*, too, are noticeable in Hyde Park, while clumps of the sweet-scented *Tobacco* (*Nicotiana affinis*) are most imposing. *Violas* naturally are to be found in the bulk of the beds, these being available for mixing with most plants. They grow freely, too, and flower abundantly. The favourite varieties are *Blue Bell*, *Beauty of Chipping Norton*, *Lilacina*, *Mrs. Turner*, *Holyrood*, and *Cliveden Purple*. *Zonal Pelargoniums* are undoubtedly less popular than they were for bedding, but they are still used extensively in Hyde Park. *Henry Jacoby* and the *Rev. F. Atkinson* are exceedingly good, these varieties making a brilliant display with large trusses of bloom. The pale yellow leaved *Pelargonium Robert Fish* is still used largely, and *Cloth of Gold* and *Meteor* are two *Fuchsias* adapted for edging. Among foliage plants *Grevillea robusta* and *Acacia lophantha* figure conspicuously, whilst for edging purposes generally *Lobelias Blue King* and *Snowball* (a good white) are extensively employed. Carpet bedding is still carried out, though on a limited scale compared with former years. The beds devoted to this style of bedding are well planted, simple rather than intricate, and, as they should be, maintained in excellent order.

From the above mentioned series of beds the visitor should cross over to the broad expanse of turf abutting Rotten Row, where beds filled with plants of a sub-tropical nature are most to be found. Here may be noted fine examples of *Seafortias*, *Chamærops*, and other *Palms*, as well as *Musas*, dotted about the grass, the tubs or pots being plunged below the surface and turfed over. Considering the rough winds which have prevailed this season the huge leaves of the *Musas* are by no means split so much as I have seen them. Large beds well filled with *Ficus elastica*, *Aspidistras*, *Eucalyptus*, *Liliums*, and other plants are

also most effective, the groundwork in many beds being planted with *Violas* of various colours. The dell at the head of the *Serpentine* likewise is devoted to sub-tropical gardening. The scene here is truly tropical on a warm summer's day. At the bottom is a small stream. The banks of this are clad with Ivy and shrubs, from which tower huge *Tree Ferns*, *Palms*, and *Cycads*, presenting to the visitor a miniature representation of a New Zealand forest. Close by a border well filled with *Fuchsias*, *Liliums*, *Snape dragons*, *Marguerites*, and other plants disposed in groups and patches makes a good contrast and naturally attracts much attention.

FINSBURY PARK.

Although small compared with some of the other metropolitan parks this northern lung of London is a popular resort. It is laid out in a picturesque style, and the bedding, both spring and summer, is always good. At the present time many of the beds there are very gay. What might be termed the "flower garden" is situated on the north side of the park, and is divided into two portions, a broad walk running through the centre. In the background on each side is a shrubby border, the front of which is now gay with *Zonal Pelargoniums*, yellow *Calceolarias*, blue *Lobelia*, *Pyrethrum*, and *Ageratum*. Clumps of *Nicotiana affinis* flowering splendidly are conspicuous in these borders. The beds also are most effective. On each side there are three large circular beds planted with *Cannas* and *Nicotiana affinis*, these being edged with pink, scarlet, and *Crystal Palace Gem Pelargoniums*. Carpet bedding is not very extensively practised in this bed, though what is done is excellent. The beds are well planted and the designs effective. Among the mixed beds *Henry Jacoby Pelargonium* shows up well, and appears to be used in preference to tuberous *Begonias*. A few beds are planted with *Begonias*, but they are by no means so extensively employed there as *Pelargoniums*. Plants of the variegated mauve dotted amongst the scarlet and crimson *Pelargoniums* produce a pretty effect, and in several beds *Acer Negundo variegata* is used as centre specimens. A number of small beds filled with *Carnations*, *Begonias*, and *Stocks*, with centre plants of the blue and white forms of *Campanula pyramidalis*, planted alternately, are very pretty, and being close to a wall are much admired.

The borders in Finsbury Park are exceedingly showy. The flowers are seen at their best, the majority of them being planted in bold masses at frequent intervals. Here may be found a large clump of *Godetias*, these splendid masses of *Violas* of various colours. The latter seem to thrive amazingly, and are now literally covered with bloom. Among other varieties *Countess of Kintore* is very conspicuous. Annuals of different kinds are similarly employed, the whole making an imposing display. On one border fine clumps of the old crimson *Clove* are noticeable. The plants apparently grow with great freedom, and are now laden with their large fragrant blooms. Where it does well this is still one of the best of border *Carnations*, and might with advantage be extensively planted. *Sedum Sieboldi*, too, is just coming into flower, great clumps of it being disposed over the borders. *Dolias* and *Sweet Peas*, the latter grown in clumps, are also showy, and the same may be said of the Sweet-scented *Tobacco* and *Hyacinthus candicans*. Among the shrubs we noted a fine bush of *Olearia Haasti* in full bloom, its pure white blossoms being exceedingly pretty.

Roses deserve a word. It is generally thought that *Roses* will not thrive in or near London. They are, however, an exception in Finsbury Park. Here beds of dwarf *Roses*, chiefly *Hybrid Perpetuals*, may be seen, and to all appearances they flourish in spite of fogs and a sulphuric atmosphere. At present the plants are looking remarkably strong and healthy, producing thick growths 4 or more feet in length. Many are, of course, past their best as regards flowers, though many at the time of my visit were in bloom. As in Hyde Park, there is a decided tendency here to depart from the ordinary bedding out system, and it is quite possible that a few years hence vigorous growing, beautiful hardy plants will take the place of the poor weak coloured foliage things that even yet disfigure many public and private flower gardens.—C. C.

SUMMER BEDDING AT HAMPTON COURT PALACE.

It is early yet to make full reference to the very charming bedding display for the summer, which is already delighting visitors to these very popular gardens. Mr. Graham is the head, but credit also belongs to the energetic foreman, Mr. Barnshaw, who has done his work well. The carpet beds evidence that this form of garden decoration is still as attractive as it is popular with the masses; one, a balloon-pattern bed, will become a great favourite during the autumn. Especially effective are the *Begonias*, and although these are largely employed in mixed beds, two that are planted with them thinly, just a few carpet plants being mixed in, will be very beautiful and do a great deal to help in popularising *Begonias* as bedding plants. The variety *Northiana*, with its myriads of pendent orange-scarlet flowers, is very fine; it cannot be excelled for effectiveness anywhere. This variety makes also a glorious pot plant, especially from two-years-divided tubers. A very pretty effect is produced by two large beds planted with *Flower of Spring Pelargonium* and blue *Violas* topped with *Abutilon Thompsoni*. *Fuchsias* are also prominent alone, also mixed with pink Ivy-leaf *Pelargoniums*, *Violas*, and diverse plants. Double *Zinnias* also will soon be in splendid condition. Such rich-coloured *Pelargoniums* as *H. Jacoby* and *Lord Gifford* make grand masses. I can guarantee to anyone who will visit these gardens during the next few weeks ample repayment in the beautiful attractions the bedding presents.—A. D.

EVENTS OF THE WEEK.—To-day (Thursday, August 11th) there will be Exhibitions at Maidenhead and Taunton Deane. On Friday, the 12th, Shows are to be held at Matlock and Cheadle, both being continued on the following day. On Saturday, the 13th, Barnard Castle Show takes place. On Wednesday, the 17th, the great Exhibitions at Cardiff and Shrewsbury will be held, both being continued on the following day. On Thursday, the 18th, Aberdeen Show opens, continuing on the 19th and 20th. A sale of Orchids will be conducted by Messrs. Protheroe & Morris on Friday, August 12th.

— THE WEATHER IN LONDON.—The weather has been much colder during the last few days. On the 7th rain fell intermittently. The 8th was bright until evening, when more rain fell. On the 9th the weather was dull, and towards evening a cold east wind sprang up, the temperature falling considerably. At the time of going to press the barometer is rising. The weather is dull and the wind easterly, but inclined to be warmer.

— UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The usual monthly meeting of this Society took place on Monday evening last at the Caledonian Hotel. Mr. W. Woods was elected Chairman. Two new members were elected. There are three members on the sick list at the present time. It was announced with much pleasure and gratitude that Mr. and Mrs. H. J. Veitch had (through the Treasurer) very kindly and generously presented the Society with a cheque for £100 on the occasion of their silver wedding, the interest of which will be put to the Convalescent Fund.

— GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We have much pleasure in announcing that the Right. Hon. Lord Brassey, K.C.B., has kindly consented to preside at the fifty-third anniversary festival dinner of this important Charity. The dinner, which was unavoidably postponed in consequence of the lamented death of Lady Goldsmid, will take place at the Hôtel Métropole on a date to be fixed in November next. Gentlemen who are interested in the welfare and progress of the Institution are invited to act as Stewards on the occasion, and should communicate with the Secretary (Mr. George J. Ingram) at 50, Parliament Street, London, S.W., who will gladly reply to any inquiries that may be addressed to him. We have also to announce that Mr. Arthur Veitch has been elected a member of the Committee in the place of Mr. John Fraser, who is retiring after many years of zealous service on behalf of the Institution.

— A GOOD CROP OF PLUMS.—Plums are the reverse of plentiful in many, if not most districts, but evidently not at Glewston Court, Herefordshire, according to the following note from Mr. S. T. Wright :—“ I am pleased to tell you our Plum crop is enormous ; I estimate it at 20 tons per acre. Apples are a heavy crop on some varieties, notably Ecklinville, Worcester Pearmain, Lord Suffield, and King of the Pippins ; other kinds below the average. Pears light.”

— FROST AND APHIDES.—On Wednesday night, the 3rd inst., we had quite a sharp frost for some four or five hours. On Friday afternoon I found aphides in quantity on the young shoots of my Tea Roses, also on the Chrysanthemums. I quite thought that I was going to boast a record as regards the aphid nuisance this year. The old idea of cheeked sap becoming sweet and palatable to this pest receives one more mark in confirmation of the theory.—J. A. W., *Norfolk*.

— ANNUALS *versus* BEDDING PLANTS.—At the last meeting of the Wakefield Paxton Society, held at the Saw Hotel, a paper was given on “ Best Hardy Annuals : How to Grow Them ” by Mr. W. Wardman, gardener to Councillor Roberts of Wakefield. The paper proved exceedingly interesting, the lecturer pointing out that by means of careful selection of the best annuals the grower may get a display in the garden equal to bedding plants and at a much less cost, as a greater variety both in form and colour is found amongst annuals than in bedding plants. There was a beautiful display of annuals on the table. A very hearty vote of thanks was accorded to the essayist and exhibitors of flowers.

— THE OPENING OF GRIMSTON PARK.—The opening of Grimston Park to the public in aid of the Gardeners' Orphan Fund and the Gardeners' Royal Benevolent Institution, by permission of J. Fielden, Esq., will take place on Wednesday, August 17th. The public will have access to the beautiful gardens and grounds, and a cricket match will be played.

— INTERNATIONAL EXHIBITION IN 1900.—It is stated that M. Carnot, as President of the French Republic, has signed a decree deciding upon the opening of a great Exhibition at Paris in 1900, so as to make a good start with the twentieth century. This is certainly taking time by the forelock, and providing us with plenty of time to prepare material for the horticultural department.

— THE JULY RAINFALL IN SUSSEX.—The total rainfall at Cuckfield, Sussex, for July was 2.57 inches, which is a little more than the average. The heaviest fall was 0.52 on the 5th. Rain fell on ten days. Maximum temperature, 76° on the 3rd ; minimum, 46° on the 1st. Mean maximum, 68° ; mean minimum, 51.2°. Mean temperature, 59.6°. Partial shade readings, 2° below the average.—R. I.

— JULY WEATHER IN HERTS.—During the past month the weather was of a very pleasant character although somewhat cool. There was a fair amount of sunshine and a good rainfall. A heavy thunderstorm occurred on the 16th, when 1.50 of rain was registered in three hours. The nights for the most part were very cold, as the wind was generally in the northern quarter. Rain fell on seven days during the month. The maximum in any twenty-four hours was 1.53 on the 16th, minimum 0.07 on the 17th. Total for the whole month 4.02 against 2.48 in July, 1891.—E. WALLIS, *The Gardens, Hamels Park*.

— DISQUALIFYING FRUIT.—“ W. H. M. ” writes :—“ I fully agree with Mr. J. McIndoe that (in the absence of the contrary in the schedule) he was fully justified in exhibiting the two Pine Apples as separate dishes, for which he was disqualified. There is no doubt that committees forming schedules ought to be more definite in quoting the conditions, which would prevent any unpleasantness through an exhibitor being disqualified. In any case the judges ought to have fully considered the words in the schedule, and doing so, I fail to see on what basis they formed their decision.”

— SALVIA PATENS.—This lovely old plant is not met with now as much as formerly. Though not hardy it makes a fine bedding plant throughout the summer and autumn. The large dark green leaves generally tinged with purple, serrated and hairy, are themselves very pretty ; but the full glory of the plants is seen when they are covered with their elongated spikes of bright blue flowers in large clumps or circular beds. There seem to be several varieties of *S. patens* differing from each other in the colour of the leaves or flowers, the latter in some instances having quite a purple shade. A round bed is looking splendid in the R.H.S. Gardens, Chiswick. Light soil suits the plants provided they can be cared for in the matter of moisture.—C. K.

— FRUIT GROWING IN AUSTRALIA.—The Earl of Jersey, Governor of New South Wales, has paid a visit of inspection to the Australian Irrigation Settlements, situated in the neighbouring colonies of Victoria and South Australia, where some 5000 settlers have become located during the last four or five years for the purpose of engaging in the cultivation of fruit, their plantations being rendered highly productive by means of irrigating them with the fertilising waters of the River Murray. The Governor and party were driven round the settlements, calling upon Lord Ranfurly, Captain Aylmer, Mr. W. B. Chaffey, and other prominent settlers, and expressed astonishment at the magnitude of the works and the horticultural progress which had been made.

— THE YELLOW CALLAS.—A few weeks ago “ Boscobel ” stated explicitly in the *Journal of Horticulture* that *Calla Elliottiana* was a hybrid between *C. æthiopica* and *C. hastata*, but on being challenged to give his authority for the statement had to confess that it was only an inference. The fruit of his precise, but, as it appears, most ill-founded assertion, is to be seen in the notes in continental papers, wherein the parentage suggested is accepted in good faith. It is in this manner that information of doubtful accuracy is disseminated, and it is very much to be regretted that explicit statements should be made on other than reliable information. Perhaps “ Boscobel ” will in the future exercise greater care in his remarks.—E. H. M.

— DEVON AND EXETER HORTICULTURAL SOCIETY. — The autumn Show of this Society has been fixed for November 11th, and is to be held at Exeter.

— MR. W. R. WILLIAMS, the able gardener at Seymour Court, Maidenhead, has been appointed gardener to John F. Hall, Esq., Sharcombe, Wells, Somerset, where he will have scope for the exercise of his taste and skill.

— CONFERENCE OF GARDENERS' ASSOCIATIONS AT TUNBRIDGE WELLS.—A full report of the proceedings at the Conference of Gardeners' Associations held at Tunbridge Wells on July 6th has been issued, price 3d., and those interested may procure copies from the Secretary, Mr. D. G. Cornwell, "Courier" Office, Tunbridge Wells.

— CERCIS SILIQUASTRUM.—May I state that I am anxious to obtain a few pods of the Judas Tree (*Cercis siliquastrum*), of which I do not know any specimens accessible hereabout. Perhaps some readers of the Journal may be able and obliging enough to let me have an example of these.—JOHN R. S. CLIFFORD, *Gravesend*. [We shall be glad if our correspondent and esteemed coadjutor succeeds in obtaining the pods in question.]

— CASSIA CORYMBOSA.—Introduced from the West Indies by a Lambeth nurseryman as long ago as 1796, this plant at the present time is seldom seen in any other than a botanic garden. Where grown in pots it flowers sparingly. This note is written with the object of bringing this plant under notice, as in large gardens, where variety is wanted, a bed of it would be a novelty and a pleasant surprise. It is no trouble to propagate either from seeds or cuttings, and is not particular as to soil. At the Royal Horticultural Society's Gardens at Chiswick a circular bed is planted early every summer, and the plants kept dwarf. They quickly form a mass of pretty green pinnate leaves, from the axils of which, towards the end of July, the corymbs of bright golden yellow flowers are produced in abundance. Many large establishments might produce fine beds of this Senna, provided it is planted in a sheltered position.—C. K.

— WILD FLOWERS.—I was interested in the description and figure of *Linaria Peloria* (page 85). It grew wild hereabout at one time, and has grown for thirty years in a neglected state at the root of a Pear tree. I enclose a flower spike, and would like to know if it is the same as the one referred to. There is another wild flower with foliage not unlike the above, its flowers being like miniature *Antirrhinums*, yellowish in colour and pretty; but it is a noxious weed. Can you name it? I also send a prettily formed blue flower, attractive to bees. It resembles the Prince of Wales' Feathers. Please name it too. I have a continuous flowering Ox-eye Daisy or Marguerite, the blooms being 3 inches across. It makes a pretty border plant, each flower lasting a month. I also have *Veronica repens* with three faint streaks of blue on the petals, different from the one cultivated. Mine grows wild near here.—W. T., *Blantyre*. [The *Linaria Peloria* spike is the same as the one figured on page 85. The miniature *Antirrhinum*-like plant is *Linaria vulgaris*, a native and progenitor of the variety *Peloria*. The blue flower is *Phacelia tanacetifolia*, a Californian annual.]

— THE NATIONAL AMATEUR GARDENERS' ASSOCIATION. — A party numbering nearly fifty members of this Association had their usual half-day's outing in Kent this season. They visited Messrs. H. Cannell & Sons' nurseries at Swanley and Eynsford. At the Home of Flowers, the 150 feet house filled with Carnations and Cannas was the chief attraction; but the most remarkable object was a fine bloom of *Stapelia grandiflora*. This remarkable Cactus-like plant produces flowers resembling the Starfish, measuring 7 inches across, and covered with soft downy hair half an inch long; its colour is somewhat like the dull rosy cheek Apple. Its odour is exactly opposite to the Rose and Carnation, and somewhat resembles tainted meat, attracting numerous blow flies. They deposit eggs in the centre of the flower, and in a few hours live maggots are distinctly seen crawling about, evidently after something agreeable, which the flower does not supply. All, particularly the ladies, were astonished, so much so that it was said it looked uncommonly like a mistake in Nature. It was evident the flies had made a mistake. After tea at the Lullingstone Castle Hotel Mr. Cannell conducted the party over his extensive grounds at Eynsford. Here the acres of *Violas* and Double Stocks seemed to astonish them, and after loading themselves with flowers they continued their journey among the annuals, vegetables, and ripening fields of corn; returning to the station at eight o'clock for home, apparently delighted with their outing in Kent.

— ROSES AT THE MANSION HOUSE.—It will be remembered that reference was recently made in the *Journal* to a Rose Show and fête held at the Mansion House in aid of the Royal Hospital for Women and Children, Waterloo Bridge Road, London. We are now able to announce that as a result the Lady Mayoress has been able to hand over to Mr. Edwin Lawrence, Chairman, and Mr. R. G. Kestin, Secretary, a cheque for £1028 9s. 9d., the net profits. This is the noblest feature of the past Rose season.

— FILMY FERNS AT KEW.—A new house for Filmy Ferns has just been erected on the north side of the large Fernery (No. 2), and the plants removed from the old house (No. 3), which is to be replaced by one more suitably adapted for the cultivation of temperate Ferns. The Filmy Fern house is 50 feet by 14 feet, with a central path and two cases running the full length of the house. The Cooper-Forster collection is now incorporated with the Kew plants, the whole forming an exceptionally rich collection of these delicate little Ferns.

— A BEAUTIFUL LANTANA.—A short time ago I observed a *Lantana* employed as an edging to a flower bed in Messrs. Veitch and Sons' Nursery at Chelsea that struck me as being particularly beautiful and useful. It only grows 4 to 6 inches high, and is covered with brilliant yellow flower heads. It comes into bloom very early, and flowers continuously until October. Its name is *Drap d'Or*. A plant like this would be most valuable in bedding arrangements, and I was not surprised to hear that many who see it order it at once.—P.

— THE GAMMA AND SMALL ERMINE MOTHS.—Not long ago I noted the abundance of the Gamma moth this season. As yet, however, the caterpillars have not been abundant, but rather the other way—i.e., scarcer than usual. I shall be curious to note if they are reported as numerous elsewhere. It may have been that many perished when young from some cause, or possibly the eggs have remained unhatched as yet. One of our familiar pests is very unpleasantly common this year in our district (*Gravesend*), the Small Ermine (*Yponomeuta padella*).—J. R. S. C.

— SUMMARY OF METEOROLOGICAL OBSERVATIONS AT HODSOCK PRIORY, WORKSOP, NOTTS, IN JULY.—Mean temperature of the month, 56.0°. Maximum on the 3rd, 81.0°; minimum on the 25th, 38.7°. Maximum in the sun on the 3rd, 136.3°; minimum on the grass on the 21st, 32.0°. Mean temperature of the air at 9 A.M., 58.1°. Mean temperature of the soil 1 foot deep, 57.9°. Total duration of sunshine in the month 112 hours, or 22 per cent. of possible duration; six sunless days. Total rainfall, 2.14 inches; rain fell on eleven days. Average velocity of wind, 8.0 miles per hour; the velocity exceeded 400 miles on three days, and fell short of 100 miles on seven days. Approximate average for July:—Mean temperature, 60.7°; sunshine 160 hours; rainfall, 2.42 inches. The coldest July for at least seventeen years, and the dullest but one (1888) of the last eleven years. A temperature of 70° was only reached twice. Sunshine is very much wanted.—J. MALLENDER.

— CHANGES IN THE KEW STAFF.—The "Kew Bulletin" for July and August contains a very complete article, with plate, on Sugar-cane borers in the West Indies. An announcement is also made of several changes in the staff. Mr. William Truelove retired from the service of the Royal Gardens on April 30th last, after serving twenty-six years as foreman of the arboretum, a position which he filled with great credit to himself and satisfaction to his superior officers. Before coming to Kew Mr. Truelove had charge of the then famous Bickton arboretum, and his selection to fill the post from which he has retired has been justified in every way. From small beginnings—the number of ligneous plants cultivated in the open air at Kew was comparatively very small twenty-six years ago—the Kew arboretum has developed to a considerable extent; at the present moment it contains about 3000 species and named varieties—excluding garden varieties of such plants as Roses, Rhododendrons, Hibiscus, &c. The Superannuation Act of 1887 having practically abolished the pensions to which men in Mr. Truelove's position were formerly able to look forward, he was on retirement only entitled strictly to the gratuity of £47 10s. which the Treasury awarded him. But in consideration of his exceptional services the First Commissioner was pleased to make a special application on Mr. Truelove's behalf to the First Lord of the Treasury. This obtained for him a further grant, though it was expressly stipulated that this was not to be regarded as a precedent for the future. The Board recorded the award in the following minute:—"In dispensing with his services the

Board desire to record their appreciation of the diligence and skill which he has shown in the discharge of his duties during the period that he has been in their employ. It is to a large extent in recognition of this that the First Commissioner recommended, and that the First Lord of the Treasury has granted, an additional gratuity of £120 from the Special Service Fund." Mr. W. J. Bean succeeds Mr. True-love as foreman in the arboretum. Mr. Bean first entered the Kew service from the gardens of Belvoir Castle on April 2nd, 1883. He was not long before rising to the rank of sub-foreman, and on the retirement of Mr. Binder in 1888, Mr. Bean became foreman of the temperate house. Mr. Thomas Jones fills the post of foreman of the temperate house vacated by Mr. Bean. Mr. Jones came to Kew as gardener on January 2nd, 1888, from the nurseries of Messrs. James Dickson & Sons, of Chester. In July, 1889, he was promoted sub-foreman in the Palm house.

— FRENCH HORTICULTURE AT THE WORLD'S FAIR.—Our neighbours are going to do themselves great credit in horticulture at the Chicago World's Fair next year, it would appear. A cablegram has been received from the French Commission asking that it be allowed to do, and bear the expense of, the "whole decoration of the spaces surrounding the Horticultural and the Woman's buildings." This generous offer, doubtless, will be accepted if it does not interfere with plans too far advanced to be changed. The French are world-renowned as artistic landscape gardeners, and it is believed they would hardly have made the offer referred to unless they intend to make a display of surpassing beauty. The Commission asked also for 60,000 square feet for the French horticultural exhibit. British horticulturists must look to their laurels; but there is little doubt that if a combined effort was made they would not be eclipsed.

— 60,000 GLADIOLI.—M. Hooibrenk, the well-known Dutch florist, an old man of eighty-four years, who has for a long time been settled at Vienna, has organised a unique Exhibition at the village of Hietzing, near the Imperial Castle of Schönbrunn. Our (*Daily News*) Vienna correspondent sends us a description of this remarkable collection of 60,000 specimens of the Gladiolus. M. Hooibrenk had them cultivated and reared out of the simple original Gladiolus which was imported from the Cape by the Bohemian florist and traveller, Prince Salm. The flowers show a tropical richness and abundance of colours. No one specimen resembles the other, and the colours vary from the white of the Lily to the red of the Pomegranate, and between these extremes are to be seen many beautiful yellow, brown, and violet tints. The various colours are also combined on one specimen. While the original flower is but small, the skilful Dutch horticulturist has by forcing, produced a flower four times the size of the Lily.

— CROSS-FERTILISATION OF FRUIT.—At a meeting of the fruit-growers of Ontario two Apples were exhibited which were the result of careful cross-fertilisation by Mr. P. C. Dempsey, between the Golden Russet and the Northern Spy. The first of these was specially commended by the Fruit Committee for appearance, solidity, flavour, and keeping quality. It seems an almost perfect Apple for export, not too large, of a clear dark red colour, such as the foreign market demands, and its very solid flesh enables it to be packed firmly and carried well. The other is rather later, and does not reach its best quality till after the New Year. It is larger, and quite as well coloured and beautiful. Both of these Apples have very small cores. The fact that they are not chance seedlings, but have been produced by careful selection from parents of known qualities, is certainly an encouragement for those who are devoting themselves in a studious way to the production of new fruits by careful breeding.—(*Garden and Forest*.)

— POTATOES AT EARL'S COURT.—The space at your disposal doubtless prevented a very wide reference to the merits of the admirable vegetables staged at the cottagers' exhibition at Earl's Court on Bank Holiday. I would trespass upon that space this week just so far as to draw attention to the excellence of the Potatoes, which were largely shown in several classes, not only because of the good variety found, but also because of the high quality of the best examples, quite reminding those with memories of the admirable exhibits formerly seen at the International Potato Exhibitions. In the class for four dishes white varieties had the pre-eminence; the best four were Windsor Castle, one of Messrs. Sutton & Sons' fine rounds, Sutton's Seedling, Chancellor, and White Beauty of Hebron. In the second four were Schoolmaster, Sutton's 21, International, and Abundance, the latter, being unusually long in form, shown as a kidney. In the single dish

classes the best four white kidneys in the order of merit were International, Satisfaction, also long in form; White Rose, and Midsummer Kidney. Of white rounds in the same order came Sutton's Seedling, the same second, Daniel's Defiance, and London Hero. Of coloured kidneys Sutton's Ruby, very handsome, though not large; Beauty of Hebron, Mr. Bresee, and Prizetaker, whilst of coloured rounds the sorts were Reading Russet, Pink Perfection, Reading Russet again, and General Gordon, a handsome purple striped variety. Here is a record of twenty distinct varieties, all of great excellence, and in no case big in sample, no less than eight of which were sent out from Reading by Messrs. Sutton & Sons.—A. D.

— WHAT JAPANESE GARDENERS DO.—"The art of the Japanese gardener," writes Sir Edwin Arnold, "had turned our little plot of a couple of acres into the appearance of a large and various pleasure, with miniature hills—from which you could see the towering snows of Fuji San—fish ponds, rockworks, trellised arbours, and clumps of flowers and bushes, which gave us an unbroken succession of floral wealth. Scattered about the grounds were stone lamps called Ishi dōrō, and grotesque demons, and quaint water cisterns in stone with Chinese inscriptions. Around these first came into bloom, defying snow and frost, the beautiful red and white and striped Camellias. When these had fallen the white and pink and rose-red plum flowers filled the eye with beauty. Afterward the Azaleas blazed, like burning bushes, all round the Lotus pond; and these were followed by a delicious outburst of pale rose tinted Cherry blossoms, making an avenue of beauty and glory all the way from the Shinto temple at our gate to the front door, where were suspended the little, indispensable, but useless fire engine and the bronze gong on which visitors beat with a little wooden hammer to announce their arrival. The Wistaria and a second crop of Camellias, and then some red and yellow Roses, took up the running, and the Maple bushes came out resplendent with blood-red leaves; after which there were purple Irises and Callas flowering by the fish pond, with orange and red Lilies brighter than the gold fish swimming in it, and the lawn became covered with a pretty little flower called the Neji-bana, the pink buds of which, growing diagonally and reaching round to get the sunlight, twisted the stem into the shape of a corkscrew. Thus, along with the sprays of the Firs and Loquats and ornamental shrubs, our gardener—whom we christened the 'Ace of Spades,' out of 'Alice through the Looking-glass,' and who wore a blue coat with white dragons upon it—was never destitute of delightful material wherewith to exercise the high art of decorating our rooms after the great æsthetic Enshin fashion."

— MAGNOLIA WATSONI AND THE ENGLISH BOTANISTS.—Under this heading Mr. W. Falconer writes in the "American Florist," "Apropos of my note about this Magnolia, June 9th, page 1009, the venerable Samuel B. Parsons of the Kissena Nurseries, writes me:—'What is the matter with the English botanists? Are they never willing to give Americans credit? Our Magnolia parviflora named in 1891 by Sir Jos. Hooker as Watsoni was introduced by us into this country through the enterprise of Thos. Hogg, and named by us in 1875. If the name is changed from that we gave it, it should be by us, and we should call it after Mr. Hogg. The English cannot plead ignorance, for we advertised and sold it ten years before it appeared in the Paris gardens, and it was well known here when they named it at Kew.' The Committee on nomenclature of the S. A. F. in their report last fall covered this case exactly. See Proceedings of Seventh Convention ('91), page 91. 'In the case of new species of plants, the first published botanical name takes precedence, but this publication must be technical and made in a recognised botanical or horticultural periodical or work, and not in a trade catalogue.' Messrs. Parsons' Magnolia was named in their trade catalogue twelve years ago, and the name was kept up by them ever since in their catalogue, but as the plant was a species and not a garden variety, the botanists cared not a crack of their fingers for Messrs. Parsons' name or catalogue, and named it just as they pleased, and their name will stand. This is pretty galling, but we cannot help it. We know the law, and if we will profit by it we must take timely advantage of it. When at Professor Sargent's the other day I called his attention to this same Magnolia Watsoni case, and he answered, 'Well, I agree with you, I don't see the justice of naming it Watsoni.' The English botanists, or European botanists anywhere, don't give us any more credit than we deserve. Our only hope, therefore, is to fight our own battles and name our own plants, and that, too, before they cross the Atlantic, and publish these names properly, then the Europeans can rename them if they wish to our name being the original one will stand for ever in spite of theirs."

TRADESCANTIA REGINA.

THE useful character and general acceptability of *Tradescantia zebrina* and other members of the genus should command attention for the large and handsome kinds that have been exhibited this year by L'Horticulture Internationale, and which may be classed as great improvements on the old species. Two, *T. Regina* and *T. superba*, have received first-class certificates from the Royal Horticultural Society this year. The former, which fig. 18 represents, exhibits remarkably attractive leaf-colouring. It is a Peruvian species of great beauty, with much bolder and more beautiful foliage than that of *T. zebrina*. The leaves are lanceolate, 6 to 7 inches long. The centre is dark green lightly flecked with greyish white. Two broad flakes of the same shade extend along each side of the central band from base to tip, and the edges of the leaf are of the same deep green hue as the centre; the under surface

with a grand promise of seeds for next year. One patch of minor *Convolvulus* yielded the deepest blue, and not far off were Marigolds of glorious colouring. The *Calendulas* were vast, of the brightest yellow and orange, almost unequalled for massing.

The Sweet Peas promised this year to make up for last year's disastrous failures, Imperial Blue, a lovely red, white in abundance, and the usual mixed sort were all represented. It must be admitted there are other flowers at this season worth looking at besides Roses. Annuals also have their excellencies. I could mention many others were their names likely to be admitted. I must claim space for three, now at the very height of glory: Summer Chrysanthemums, Nasturtiums, and Godetias. The good monks to whose domain the Suttons in part have succeeded—and they are very loyal to the Abbey in Reading—(The Abbey arms with the town arms are on the Palmer Park gateway; the Abbey Hall is a most admirable Evangelistic place of worship; the Archaeological Society, again, rejoices in the Abbey three-escalop-shells badge and holds its meetings in the Abbey gateway house by favour of

FIG. 18.—TRADESCANTIA REGINA.

is purple. Added beauty is given to the foliage by the rich rosy mauve colouring of the young leaves. This is a notable addition to the list of plants suitable for surface covering.

SUTTON'S SEED TRIAL GROUND.

TRAVELLERS at this season approaching Reading by the G.W.R. may be seen deeply interested by the view on their left hand; if by the S.E.R., it is true they have the noble Palmer's Park on their left, but still more interesting is the sight on their right. The trial grounds are between the two railways, and the glorious beauty of the vast beds of annuals as massed there must be seen to be realised. The result is a Turkey carpet of more than gigantic size and of more than gorgeous colours. Art is a very long way off being a copier of Nature. These beds of flowers are well worthy of a closer inspection. They are always open to the public with a generous hospitality, the seventy acres of trial ground running up from the Palmer Park to the very edge of the woods of Sonning.

The entrance is up a wide path bordered with various kinds of grasses, and then presently begin the bright patches to be taken in detail. The Shirley Poppies were nearly over and showed endless heads

the Corporation.) I was saying, those worthy Benedictines, how they would wonder at the two railways and admire the grounds if only once again they could revisit their former property, especially if they could see the last three seed plots I have space to mention.

The advance in Nasturtiums of late is really wonderful. Tall Fairy Queen is an exquisite variety with profuse flowers of the most lovely white, yellow, and the very palest shadings of red; then come grand masses of King Theodore bronzed almost into blackness, and Empress of India, fiery red with its darkest green leaf; while the mixed Tom Thumb varieties show nearly every colour from palest yellow to darkest orange, many beautifully striped, almost all shades of colour, in fact, except that blue which even the queen of all flowers has never attained to. The Summer Chrysanthemums are now at their very best, and of amazing variety, Cloth of Gold single, double white, golden bronze, Picotee edged, vast masses of each; it is utterly impossible to give an idea of their loveliness. And then what eclipses all else is the large portion of ground which is now carpeted with masses of Godetia. Its exceeding beauty was a new revelation to me.

Imagine several acres of the most perfect Azaleas, but exhibiting far more colours than they can attempt, and not on bushes, but 1 foot high, and so thick that the leaves can hardly be seen for the flowers. And such flowers! Satin Rose, of the softest and brightest Duchess of

Albany, a pure white, very large and resplendent; and then the purple, and claret coloured, and other varieties! and, by way of climax, as one of those employed there informed me, a packet to be had for the sum of 3d., with seed in it enough to make gloriously gay their own appointed side of the garden. I am almost persuaded that in August, at any rate, Roses have rivals.—A. C.

ROYAL HORTICULTURAL SOCIETY.

AUGUST 9TH.

THE Drill Hall was only half filled on this occasion, but if the exhibits were not very extensive they were fairly diversified, and formed a display by no means devoid of interest.

FRUIT COMMITTEE.—Present: Philip Crowley, Esq., in the chair; and Rev. W. Wilks, with Messrs. H. J. Pearson, T. Francis Rivers, G. Bunyard, J. Cheal, W. Bates, A. Dean, H. Balderson, G. W. Cummins, G. Reynolds, G. Wythes, G. Sage, J. Taber, and J. Wright.

Tomatoes, Melons, Figs, Peaches, Peas, and Vegetable Marrows were brought chiefly under the notice of the Committee; but the most noteworthy fruits were a dish of Cherries and Plums from Sawbridgeworth. A. W. South, Esq., Measden House, Measden (gardener, Mr. C. Payne), sent fruits of a new and very neat seedling Tomato, resembling Conference (vote of thanks). Mr. Leach, The Gardens, Albury Park, sent large fruits of Lady Bird Tomato, of which he exhibited clusters of small fruits in the winter. The fruits, though fine, were over-ripe. A dozen fruits of Swanson's Eclipse Tomato were sent by Messrs. J. R. Pearson and Sons, Chilwell. They were very globular and beautifully shaped, but apparently over-ripe, and the quality consequently was not at its best (vote of thanks). W. M. Bullivant, Esq. (gardener, Mr. T. Crosswell), sent a good dish of Tomatoes (vote of thanks).

Mr. Crosswell sent four Melons closely and splendidly netted, quite distinct in appearance, but not properly ripened. This is a Melon of promise, and the Committee desired to see it again. Mr. J. Barkham, Haver Street, Ryde, sent a Melon, but distinctly over-ripe. T. Statter, Esq., Stand Hall, Whitefield, Manchester (gardener, Mr. R. Johnson), sent a fine-looking Melon, but quite deficient in quality. Mr. G. Wythes sent from Syon House, seedling green-flesh Melons of a very peculiar flavour that did not seem to be highly appreciated. Messrs. Hender and Sons, Plymouth, sent a dish of Hartley Green Gage Gooseberries. They were too ripe for testing the flavour, which was, however, not superior to some other of the best dessert varieties. The variety is said to be a very abundant bearer. Mr. Leach sent a dish of Runner Beans with long pods (vote of thanks).

Mr. T. F. Rivers sent a dish of Emperor Francis Cherry; fruit pale red, of enormous size, and extremely rich in flavour. The fruits had been grown on a tree in a pot, and a cultural commendation was unanimously awarded. Mr. Rivers also showed fruit of the Late Transparent Gage Plum. The flesh is very firm and the flavour delicious. It ripens about the end of August. For growing in warmer climes where it would ripen sooner, it is thought it would prove of great value for drying. Persons who wish to taste Plums in perfection should grow the Late Transparent Gage. A first class certificate was unanimously awarded, as well as to the Emperor Francis Cherry, and both well deserved the honour.

Several dishes of Figs were brought from Chiswick, including Bourjasotte Grise, medium size, roundish, of excellent quality, and the tree is an abundant bearer. Nebian, fruit large, green, extremely rich, like a sweetmeat. Monaco Bianco, green, roundish, and remarkably rich in flavour. Gouraud Noir, purplish black, of good size and excellent quality. Violette Sepor (Veitch), yellowish, of good size and splendid flavour. Grosse Violette de Bordeaux, small to medium, purple, rich, and hangs long when ripe. Large Black Dawro, large but of only fair quality. Madeleine, yellowish, small and very free bearer, fruit refreshing but rather watery.

First class certificates were awarded to Bourjasotte Grise, Nebian, Monaco Bianco, Gouraud Noir, and Violette Sepor. Leaves and fruit, were exhibited attacked by the Continental Phytopsis ficus, its destructiveness being apparent in the arrested growth.

Messrs. W. W. Johnson & Son, Boston, sent thirteen varieties of Peas, good in size and colour (a cultural commendation was awarded). Messrs. Sutton & Sons, Reading, exhibited large baskets of three varieties of Peas. Sutton's Perfection, 3 feet, dark green, nine and ten peas in a pod; New Marrowfat, 4 feet, splendid dark pods, nine peas; and Windsor Castle, 3 feet, clear green, fine pods. These Peas had been grown in a field for market, without stakes, and were far in advance of the best samples usually offered for sale.

Messrs. D. Burton & Son, Bexley Heath, sent four boxes of Peaches and the same number of Nectarines, as packed for market. They were very fine, and a small silver medal was awarded. Vegetable Marrows in many varieties were exhibited from Chiswick.

FLORAL COMMITTEE.—Present: W. Marshall, Esq., in the chair; Messrs. R. Dean, H. Herbst, H. B. May, R. B. Lowe, W. C. Leach, C. E. Pearson, G. Phippen, James Walker, J. T. Bennett-Poë, T. Baines, H. Cannell, R. Owen, B. Wynne, H. Turner, G. Paul, T. W. Girdlestone, and G. Gordon.

Mr. Thos. S. Ware, Hale Farm Nurseries, Tottenham, exhibited a collection of Carnations in bunches with their own foliage, which were extremely attractive, and well showed the effectiveness of these charming flowers for cutting. Gloire de Nancy, Ketton Rose, Germania, Mrs. Frank Watts, Mrs. Reynolds Hole, and the Picotee Redbraes were

amongst the most prominent. A silver Banksian medal was awarded. Mr. Cuas. Turner, Royal Nurseries, Slough, had three stands of Carnations and Picotees. King of Scarlets was noteworthy for smoothness of petal and great size of bloom, but was lacking in perfume. A yellow ground Picotee named Remembrance was very attractive, and so was the deep rose self Salamander. These and several others received awards of merit; see below. Mr. W. C. Leach, Albury Park Gardens, Guildford, exhibited a large-flowered crimson and fragrant Mignonette named Her Majesty; also double Stocks and Zinnias. The latter represented an excellent strain, but the colours of most of the flowers were faded. A vote of thanks was accorded. A beautiful collection of Sweet Peas came from the Society's garden at Chiswick, the varieties being extremely beautiful. They comprised Dorothy Tennant, Boratton, Ignea, The Queen, The Bride, Countess of Radnor, Waverley, Indigo King, Princess of Wales, Primrose, Queen of England, Orange Prince, Her Majesty (a beautiful rose), Imperial Blue, Mrs. Eckford, Apple Blossom, Delight, Empress of India, Cardinal, Splendour, Lemon Queen, Mrs. Gladstone, and Jeannie Lea. Mr. F. Bull, Wormingsford, Colchester, exhibited a box of seedling Carnations; Mr. W. H. Divers, Ketton Hall Gardens, Stamford, had a bunch of his beautiful variety Ketton Rose; and Mr. R. Greenfield, Leamington, sent border Carnations Lord Randolph Churchill and The Speaker. Mr. Wells, Earlswood, exhibited a Chrysanthemum named Rose Wells. It was about a foot high, and had four expanded flowers of a rosy lilac shade, as well as several buds.

Mr. R. Dean, Ealing, sent Antirrhinums George Findlay (award of merit) and Brilliant, Lathyrus delicata, and Sempervivum Boissieri. A box of new Roses came from Messrs. Paul & Son, Cheshunt, comprising H.P.'s T. B. Haywood, Chas. Gater, and J. D. Pawle, Bourbon Mrs. Paul, Noisette Gustave Régis, and Tea Waban. Mr. A. Waterer, Woking, exhibited a Liliun named Parkmani, somewhat resembling auratum, but the petals more loosely disposed and more reflexed, deeply suffused with rosy crimson, and marked with purple patches. It is rich in colour. A flower stem was shown inserted in a pot of sand. H. Warburton, Esq., Claverhouse, Ascot, exhibited a Begonia named Ethel Louise, with handsome foliage, but nothing noteworthy in the inflorescence. Mr. P. McArthur, Maida Vale, exhibited Aloe Gortonia in bloom. Mr. G. Clarke sent a variety of Lathyrus latifolius with lilac wings and rich rose keel. Mr. Edmund Holman, Bishops Waltham, had a double Tuberous Begonia with bright salmon red flowers and white centre, unnamed. Mr. T. Jannoch, Dersingham, King's Lynn, received a cultural commendation for a beautiful box of Lilies of the Valley. These were very noteworthy considering the time of year. Messrs. J. Veitch & Sons exhibited a box of their Rhododendron Javanico-Jasminiflorum hybrids, a class of great beauty and value; a large box of Streptocarpus from seed sown in January of this year—a delightful display. They also had Robinia Pseud-Acacia semperflorens, Eucryphia pinnatifolia, Pavia macrostachya, and Vallota purpurea amabilis. A silver Banksian medal was recommended. Mr. Wythes, Syon House Gardens, received a similar honour for a magnificent group of Campanula pyramidalis, blue and white, which he grows very finely. C. p. compacta received an award of merit.

Messrs. Cannell & Sons, Swanley, exhibited a collection of tuberous Begonias, arranged in bunches, with Fern and Asparagus, also Cactus Dahlias Robert Cannell, Mrs. Keith (see awards below), and Cannell's Favourite; and several Stapelias. The Begonias were extremely attractive, and the plan of arranging them should be more generally adopted (a silver Banksian medal was awarded).

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair), Messrs. J. O'Brien, H. M. Pollett, T. W. Bond, E. Hill, H. Ballantine, W. H. White, F. Sander, and Dr. Masters.

Messrs. Hugh Low & Co., Upper Clapton, had some beautiful pieces of Vanda coerulea, also the chaste little Angræcum articulatum, Cypripedium leucociliun, and Trichopilia rostrata. Messrs. Sander & Co., St. Albans, had a small but varied and interesting group, comprising Cattleyas Gaskelliana, gigas, and Schofieldiana; Odontoglossum Schröerianum; Cypripediums Macfarlanei, Doliare, Doris, pectinatum, radiosum Sander's variety, and Ashburtoniae expansum; Vanda Sanderiana, Saccolabium Hendersoni, Calanthe Sanderiana (see below), Lælia Oweniana (see below), and others; a silver Banksian medal was awarded.

T. Statter, Esq., Stand Hall, Whitefield, Manchester (gardener, Mr. Johnson), sent Lælia elegans Bluntii, a richly coloured variety, also L. Amesiana and L. crispa superba (see below). Messrs. Charlesworth, Shuttleworth & Co. sent Bifrenaria Charlesworthi, Zygopetalum Warlesianum, Oncidium macranthum nanum (see below), Anguloa Turneri, Miltonia Morelliana atro-rubens, and Oncidium intermedium. C. L. N. Ingram, Esq., Elstead House, Godalming (gardener, Mr. T. W. Bond), sent Lælio-Cattleya Ingrams (see below) and Cypripedium Elsteadiana (so-called, though obviously the name should be elsteadense) F. Wigan, Esq., Clare Lawn, East Sheen (gardener, Mr. W. H. Young) exhibited Lycaste tetragona and Angræcum caudatum. Messrs. J. Veitch & Sons sent Cypripedium Astræa; J. M. Barton, Esq., Cypripedium Maynardi; and M. Godefroy Lebeuf, 5, Rue d'Edinbourg, Paris, C. caudatum Luxembourg variety (see below).

CERTIFICATES AND AWARDS.

Cypripedium caudatum Luxembourg variety (M. Godefroy-Lebeuf).—A very beautiful and distinct variety, remarkable for the colouring of the dorsal and lower sepals. These are rich buttery yellow, paler towards the base, and veined with green. The dorsal sepal arches over, exposing the

deep yellow of the back. It is narrow and recurved, the two edges meeting at the back. The pouch is dull green, dotted on the edges of the throat with purple, the interior pure white. The tails are long and twisted, dull purple in hue (first-class certificate).

Lælio-Cattleya Ingrami (C. L. N. Ingram, Esq.).—A hybrid between *Lælia pumila* Dayana and *Cattleya aurea*, the former being the pollen parent. It is quite a miniature Orchid, not exceeding 6 to 8 inches high. The leaves are bluntly lanceolate. The solitary flower was very beautiful and distinct in respect to colour. The sepals and petals are rosy mauve, the latter being much broader than the former, and wavy in outline. The lip is a very deep velvety purplish crimson, the colour extending right into the throat (first-class certificate).

Oncidium macranthum nanum (Charlesworth, Shuttleworth & Co.).—In this variety the flowers are similar to the type, but the peduncle is only a foot long (award of merit).

Lælia crispa superba (T. Statter, Esq.).—A grand plant bearing three flower stems and about twenty blooms. The sepals and petals are white, the lip velvety purple shading to mauve, and elegantly fimbriated (award of merit).

Lælia Oweniana (F. Sander & Co.).—This is a hybrid between *L. Dayana* and *L. xanthina*, and is very attractive. The sepals and petals are pure white, the side lobes of the lip brownish purple, the centre white, and the throat pale yellow (award of merit).

Calanthe Sunderiana (F. Sander & Co.).—A distinct and attractive species with a flower stem about 18 inches long. The blooms are borne alternately towards the top; the sepals and petals are purplish mauve, the lip rich purplish magenta (award of merit).

Dahlia Mrs. Keith (H. Cannell & Son).—A decorative variety of admirable form; central florets yellow, suffused with rosy magenta; outer florets deeply suffused with the latter shade (award of merit).

Sarracenia Farnhami (W. E. Farnham, Esq., Loughborough).—An extremely beautiful form, 12 to 15 inches high, the pitchers rich crimson with paler transparent patches (first-class certificate).

Antirrhinum George Findlay (R. Dean).—A very beautiful variety, yellow, flaked and spotted with crimson, raised by Mr. Forbes; described as a dwarf bushy grower and very free (award of merit).

Campanula pyramidalis compacta (G. Wythes).—A dwarf selection of the well-known type, about 4 feet high, and densely clothed with bloom (award of merit).

Carnation The Moucher (Mr. Spurling, Blackheath).—A tree variety with bright yellow flowers of good form, petals broad and substantial but scentless (award of merit). We cannot see much taste in the nomenclature.

Picotee Duchess of Sutherland (Turner).—A large, well-formed flower, white ground, heavily edged with rose, the colour breaking somewhat into the petals (award of merit).

Picotee Nellie Bath (Turner).—A large yellow ground, heavily edged with purplish crimson (award of merit).

Carnation Old Coin (Turner).—A Fancy of considerable merit, the flowers being large and well filled; the colour is a mixture of yellow, light brown, and crimson.

Picotee Mrs. Arthur Barrett.—A yellow ground, heavily edged with rosy-red (award of merit).

Carnation Salamander (Turner).—A large, handsome, and well-filled self, rich rose (award of merit).

Carnation King of Scarlets (Turner).—A large, full, and heavy flower, with broad crumpled petals, very glowing in colour (award of merit).

Carnation Acme (Messrs. Pearson & Sons, Chilwell).—A Fancy, yellow ground flaked with bright rose, flower large. The variety is evidently a very free bloomer (award of merit).

Cherry Emperor Francis (Rivers).—Fruit pale red, of enormous size, and extremely rich in flavour (first-class certificate).

Plum Late Transparent Gage (Rivers).—Flesh very firm, of delicious flavour, ripening about the end of August (first-class certificate).

Fig Bourjasotte Grise (R.H.S. Gardens).—Fruit medium size, roundish, of excellent quality. The tree is an abundant bearer (first-class certificate).

Fig Monaco Bianco (R.H.S. Gardens).—Green, roundish, and remarkably rich in flavour (first-class certificate).

Fig Gourand Noir (R.H.S. Gardens).—Purplish black, of good size and excellent quality (first-class certificate).

Fig Violette Sepor (Veitch).—Yellowish, of good size and splendid flavour (first-class certificate).

In the afternoon a paper on Fuchsias was read by Mr. G. Fry. It was to be regretted that there were no plants in the Drill Hall to illustrate and give weight to his remarks. If a collection of species as well as florists' varieties could have been got together it would have been of much interest.

CARNATION SHOWS.

THE CARNATION AND PICOTEE UNION, OXFORD.

THE annual Exhibition was held in Mr. Dodwell's garden in the Stanley Road on Tuesday, August 2nd, and was in every way most satisfactory. Not only were there good entries in the various classes, and quality ruling good, but there was the additional attraction of the superb display of Mr. Dodwell's plants, just in prime condition, his garden being now given up to a great extent to the culture of these two

popular flowers. Those who have not seen Mr. Dodwell's gardens cannot without a visit get a reliable notion of the wealth of beauty to be found there in the thousands of plants in bloom, which include so large a number of Mr. Dodwell's own seedlings. Mr. Dodwell himself was in excellent health, considering the ravages of a very dangerous illness not long since, and gave a cordial welcome to friends, his old floral confrères especially. It was also pleasant and gratifying to see Mrs. Dodwell in health again, for she also was not long since prostrated by a very serious illness.

In the class for twelve Carnations, flakes or bizarres, dissimilar, Mr. M. Rowan, Clapham, was first with a stand of very fine flowers—viz., Gordon Lewis, very fine; Thalia, Master Fred, George Melville, William Skirving, extra fine; Robert Houlgrave, a beautiful bloom of Jessica; Sportsman, in good character; Robert Lord, Oscar Wilfred, a rich coloured P.F.; Edward Rowan, and a fine bloom of John Buxton. Second, Mr. Reed, gardener to Mr. E. S. Dodwell, with a fine seedling R.F. 722; Master Fred, John Cliff, a fine C.B.; Florence Nightingale, Sarah Payne, Robert Houlgrave, Rifleman, Chaundy's 340, a superb scarlet flake; and seedlings. Third, Messrs. Thomson & Co., Spark Hill Nurseries, Birmingham, the finest blooms being their fine S.F. Claudian (F.C.C.), Sarah Payne, Seedling R.F., a fine bloom of C. H. Herbert; Master Fred, Thalia, Florence Nightingale, Admiral Curzon, Gordon Lewis, and Sharp's Lord Salisbury, a bright and promising C.B. Fourth, Mr. C. Phillips, Reading, in whose stand were fine blooms of Sportsman, Rifleman, Rob Roy, and Admiral Curzon, very fine. Fifth, Mr. A. R. Brown, with fine blooms of Edward Adams S.B.; John Keet, R.F., E. S. Dodwell, and a very fine Mars S.B. Sixth, Mr. George Chaundy, Oxford, there being three promising seedlings in this stand. Seventh, Mr. John Walker, Thame, Oxon.

Six blooms, dissimilar.—First, Mr. F. Hooper, florist, Bath, with Mrs. Barlow, Mrs. Daniels, Dr. Foster, P.F., dark in colour; Robert Houlgrave, Royal Scarlet, and a very fine seedling C.B. Second, Mr. Robert Sydenham, Birmingham, with Master Fred, very fine; Sarah Payne, Lovely Mary, Campbell's Miss Grainger, a promising P.P.B. with good petal; Prince George of Wales, and Thalia. Third, Mr. J. J. Keen, Southampton, with Matador, Rifleman, William Skirving, Sybil, Robert Houlgrave, Geggie's Ellen Crossley, a very promising P.P.B., as shown. Fourth, Mr. F. Nutt, Southampton. Fifth, Mr. W. Bacon, Derby. Sixth, Mr. John S. Heddesley. Seventh, Mr. R. Vesey, Clapham.

For twelve Picotees, Mr. Reed, gardener to Mr. E. S. Dodwell, was first with Norman Carr, very fine; Little Phil, Mrs. Coldridge, very fine; Nellie, very fine; Annet Lyle, Favourite, Imogen, Mrs. Sharp, Amelia, very fine; and three seedlings. Second, Mr. Rowan, with Little Phil, Amy Robsart, very fine; Favourite, J. B. Bryant, Clara Penson, Nellie, very fine; Mrs. Payne, very fine; Calypso, Edith D'Ombra, Mary, Mrs. Dodwell, and Mrs. Gorton. Third, Mr. George Chaundy, Oxford, with Mrs. Burnett (seedling) extra fine; Dora Goodman, light rose edge, a very fine flower; a very fine bloom of Favourite, and others. Fourth, Messrs. Thomson & Co., Henry, red edge; Campanini, Lady Louisa, and Mrs. Ricardo, being fine. Fifth, Mr. John Walker, Thame, having Mrs. Gibbons very fine, and a good bloom of Nellie. Sixth, Mr. C. Phillips. Seventh, Mr. Vesey. Eighth, Mr. Anstiss, Brill.

For six Picotees, dissimilar, first Mr. W. Bacon, Derby, with Her Majesty, Norman Carr, Little Phil, very fine; a lovely bloom of Nellie, Mrs. Payne, and a grand bloom of Miriam. Second, Mr. Robert Sydenham with Constance Heron, Favourite, Lady Louisa, very fine; Brunette, Norman Carr, and Lakin's Seedling No. 10, very fine. Third, Mr. Rebeck, Southampton, Nellie and Mrs. Sharp, good. Fourth, Mr. Keen, Isabella Lakin and Mrs. Payne, both fine. Fifth, Mr. A. R. Brown, Handsworth, Birmingham, Juliette and Amelia being the best. Sixth, Mr. F. Hooper. Seventh, Mr. H. Startup. Eighth, Mr. John Payne, Oxford. Ninth, Mr. Nutt.

Twelve Fancy, Self, or yellow ground varieties, dissimilar.—First, Mr. Reed with Dodwell's 919, 921, 184, 167, Germania, Van Dyck, Madame Van Houtte, Schleiben (very fine), Theodore, Stadtrath Bail (very fine), also Premier; Gentle Jackie, a very fine pale pink Self; and Dodwell's 931, pale primrose with white blotch on the margin of each petal, and quite distinct. Second, Messrs. Thomson & Co. with Parbine Liecca (Pauline Luca?), one of Benary's new varieties, bright rosy carmine, and extra fine; Brockhaus, another of Benary's new ones, and resembling Schleiben in the peculiar slate colour; Mrs. Joseph Chamberlain, a lovely Self; Germania; Van Dyck, very fine; Firefly, very brilliant colour; Mrs. Fred; Negress, rich dark Self; Klopstoeck, another of Benary's new varieties, very bright colour, and fine; Purple Emperor; Kathleen (Fancy), deep salmon tinted; and Victory, a brilliant coloured Fancy, somewhat resembling A. W. Jones. Third, Mr. M. Rowan, with the crimson Self Germania, Emmie, Terra Cotta, Janira, and Rose Celestial, all very fine. Fourth, Mr. George Chaundy, Seedling 1105, Mrs. Fred, and Hebe, all fine. Fifth, Mr. R. Sydenham, Victory and Ruby, fine. Sixth, Mr. C. Phillips. Seventh, Mr. J. Walker, and in this stand was a good bloom of Benary's Von Helmholtz, style of Mrs. Edwards, but better; and an excellent bloom of Queen of Hearts, one of the best of the Kilmurrys.

For six blooms of miscellaneous Fancies, Selfs, or yellow grounds.—First, Mr. W. Bacon with four seedlings, Mrs. Fred and Germania. Second, Mr. Nutt with Gladys and Terra Cotta, both fine; Germania, Annie Lakin, The Governor, and Theodore. Third, Mr. Rebeck with Lord Rendlesham (Fancy), very fine; Gladys, Annie Lakin, Germania, Joe Willett, and The Governor. Fourth, Mr. A. R. Brown, Victory and Schleiben, very fine. Fifth, Mr. J. P. Sharp. Sixth, Mr. Keen, who had

in his stand Benary's Gustav Frytag, very pale orange salmon, a distinct and beautiful variety.

In the class for six Kilmurry yellow ground seedlings, not less than three varieties, the awards were made as follows:—First, Mr. Reed with Nancy, Patricio, very fine; Queen of Hearts, also fine; Lyles No. 4, Tournament, and Gretchen. Second, Mr. Rebeck with Tournament (2), Queen of Hearts (2), Alfred Grey, and Exile. Third, Mr. W. Bacon, Rachel, very fine. Fourth, Mr. G. Chaundy. Fifth, Mr. Anstiss.

For six blooms of yellow grounds, any raisers, Messrs. Thomson and Co. were first with Terra Cotta, Victory, Rachel, Mr. Robert Sydenham, a superb new variety, raised by Mr. Douglas; Madame Van Houtte, and A. W. Jones, a fine collection of blooms. Second, Mr. Reed with Dodwell's 919 and 921, Germania, very fine; Nancy, Queen of Hearts, and a very fine Stadtrath Bail. Third, Mr. F. Hooper with Romulus and Janira, both fine, and four seedlings. Fourth, Mr. J. Walker, Thame, Dodwell's 156, fine. Fifth, Mr. Keen, Stadtrath Bail, very fine. Sixth, Mr. Nutt, Lilian, very fine; and a fine bloom of Agnes Chambers. Seventh, Mr. A. R. Brown. Eighth, Mr. Rebeck. Ninth, Mr. Anstiss.

SINGLE SPECIMENS.—A large number of single blooms were staged, and the following were the awards:—Scarlet Bizarres.—First and fourth, Mr. Rowan, with Robert Houlgrave. Second, Mr. Reed, with ditto. Third, Mr. Phillips, with Admiral Curzon. Fifth, Messrs. Thomson & Co., with the same. Crimson Bizarres.—First, second, and fifth, Mr. Robert Sydenham, with Master Fred. Third, Mr. Rowan, with Edward Rowan; and fourth with J. D. Hextall. Pink and Purple Bizarres.—First and third, Mr. Rowan, with Wm Skirving; and fourth with Sarah Payne. Second and fifth, Mr. R. Sydenham, with Sarah Payne and Miss Grainger. Scarlet Flakes.—First, Mr. G. Chaundy, with Guardsman, a superb flower. Third, Messrs. Thomson & Co., with Claudian. Fourth, Mr. Rowan, with Sportsman. Fifth, Mr. Sydenham, with Clipper. Purple Flakes.—First and fourth, Mr. Rowan, with Gordon Lewis; and third with George Melville. Second, Mr. Reed, with 1003. Fifth, Mr. Phillips, with Seedling. Rose Flakes.—First, Mr. Sydenham, with Thalia; and third with Lovely Mary. Second, Mr. Reed, with Seedling 722. Fourth, Mr. Rowan, with John Baxter. Fifth, Mr. Startup, with Mrs. May.

The single bloom classes of Picotees were thrown together and divided into three classes—heavy edge, medium edge, and light edge, and the awards were as follows:—Heavy edged.—First, Mr. Chaundy with a very fine bloom of Morna. Second and sixth, Mr. Rowan with Amy Robsart. Third and fifth, Mr. Reed with Little Phil. Fourth, Mr. Rowan with same. Seventh, Miss Thomson with Gertrude. Medium edged.—First, Mr. W. Bacon with Miriam (see certificate), a grand bloom, and fifth with the same. Second, Mr. Reed, with Mrs. Coldridge. Third, Mr. Chaundy with Mrs. Burnett (see also certificates). Fourth, Mr. Vesey with Norman Carr. Sixth, Mr. Rowan with Muriel; seventh with Mrs. Payne. Light edged.—First and second, Mr. Rowan with Nellie, and sixth and seventh with Mary. Third, Mr. Phillips with Jessie. Fourth, Mr. Sydenham with Sylvia. Fifth, Mr. Reed with Favourite.

For Selfs Messrs. Thomson were first with Mrs. Joseph Chamberlain (see also certificates), and second with Mrs. Fred. Third and fifth, Mr. Sharp with Germania. Fourth, Mr. Nutt with Annie Lakin.

Fancies.—Mr. Nutt was first with a grand bloom of Von Beningen, and fourth with Theodore. Second, Mr. Reed with Van Dyck, and fifth with Schleiben. Third, Messrs. Hewitt & Co. with Sir Henry Wiggin, a fine flower resembling Dorothy. **Yellow Grounds.**—First, Mr. Nutt with Terra Cotta. Second, Mr. Reed with Dodwell's 846, third with Stadtrath Bail, and fourth with Dodwell's 150. Fifth, Mr. F. Hooper with a seedling.

FIRST-CLASS CERTIFICATES.—CARNATIONS.

A fine collection of flowers was staged for certificates, high class quality ruling throughout, three scarlet flakes obtaining these honours, a circumstance unprecedented in the history of the Carnation. And Mr. Dodwell may honestly feel some degree of pride in this event happening at one of his great Carnation *jêtes*. The following flowers received the honours of a F.C.C.

Claudian, S.F.—Exhibited by Messrs. Thomson & Co., Birmingham. A noble well built flower, bright in colour with clear white ground, and fine petal.

Guardsman, S.F.—Exhibited by Mr. George Chaundy, Oxford. A very bright coloured flower with superb petal and form, and very fine.

William Dean, S.F.—Exhibited by Mr. George Chaundy, Oxford. Not so large as the two preceding, but grand in its rich colouring and bold flakes, very good in form and petals, and the white very fine.

Fred Phillips, P.P.B.—Exhibited by Mr. George Chaundy. A bright deep coloured, very fine flower.

Princess May (Self).—Exhibited by Messrs. Hewitt & Co., Birmingham. Soft pink tinted blush colour, a very fine flower.

Mrs. Joseph Chamberlain (Self) exhibited by Messrs. Thomson & Co. A very lovely pale salmon pink self of exquisite form and beautiful petal, and quite distinct.

Negress (Self) also from Messrs. Thomson, rich dark shaded crimson maroon with a velvety surface; both fine and distinct.

PICOTEES.

Miriam, medium purple edge; a bright margin, a flower of great substance; broad petal; the white very pure; a superb flower. Exhibited by Mr. Wm. Bacon, Derby.

Mrs. Burnett, heavy rose edged. Exhibited by Mr. George Chaundy. Broad petal; a full well built flower, and very fine.

Duchess of Portland (Fancy).—Exhibited by Mr. Joseph Lamb, Burton Joyce, Notts. White, with small pale rose bars, resembling Thomson's "Annie Sophia," but deeper in colour; a fine well built flower with a strongly marked Old Clove Carnation perfume; a fine border variety especially, as well as an exhibition flower.

PREMIER BLOOMS.—The premier blooms in the Exhibition were:—Carnation Seedling R.F. 722, shown by Mr. Reed. Self Germania by Mr. Rowan. Fancy Van Dyck by Mr. Reed; also Picotees Little Phil, and yellow ground Stadtrath Bail, by the same exhibitor.

Mr. Thomas Anstiss sent a stand of twelve fine Dahlias.

Picotees were generally in grand form, purity and quality being strongly represented. There was also a marked advance in the Fancies, the leading winning stands being especially fine, Mr. Dodwell's twelve, exhibited by his gardener, Mr. Reed, and Mr. Bacon's six being of remarkable quality. Both Fancies and Selfs are fast finding their way into the affection of growers, and most deservedly so, for they are really beautiful. Mr. Dodwell must be credited with having assisted much to make both sections popular.

The southern growers were in condition. The Lancashire, Yorkshire and still more northern growers' plants were not in bloom. The season in the north, even to Scotland, is very late. The Birmingham growers did much better than they expected, for so few blooms were open, and some very promising blooms they depended upon were so long in developing that they collapsed before getting fully developed, and their final bloom is late, the flowers not being of the usual size.

The luncheon party at Oxford is always a most pleasant meeting of growers, judges, and friends, and the luncheon itself of a *recherché* character. Mr. Dodwell presided, Mrs. Dodwell sitting by his side, and many members of his family present. A few genial speeches were made, a most delightful feature of the gathering being the finished vocal music by Mr. E. Jackson's quartette party, so heartily enjoyed by the visitors from a distance, who have not many opportunities for hearing such admirably rendered glees and quartettes.

Mrs. Dodwell was the recipient of a handsome presentation silver teapot to celebrate the Jubilee year of her married life.

THE MIDLAND CARNATION AND PICOTEE SOCIETY.

THE second annual Exhibition was held at the Edgbaston Botanic Gardens on Saturday, the 6th inst., and although the Yorkshire and Lancashire and more northern growers were not in bloom, and could not stage a flower, there was an excellent display; a large number of fair blooms were staged, and the competition was very close in many instances.

For twelve Carnations, dissimilar, Mr. R. Sydenham was first with an excellent stand of flowers, amongst them Master Fred, a very fine flower, beautifully marked and rich in colour; Edward Adams, S.B., a good flower and finely bizzared; Prince George of Wales, finely flaked with purple and ground colour very pure; Sarah Payne, P. and P.B., rich in colour with a clear white ground, and still one of the best; Thalia, very bright and evenly marked. Second, Mr. E. S. Dodwell, his best blooms being a grand Dodwell's Othello S.B. with bright scarlet and maroon markings and fine form; Dodwell's 1003 P.F., clear white ground finely flaked with bright purple; Chaundy's 346, deep scarlet flake, clear ground colour and fine form; and a seedling, R.F. 1026, bright rose on a clear white ground. Third, Messrs. Thomson & Co., Birmingham, and in this stand was a fine bloom of C. H. Herbert, S.B., Robert Houlgrave, very fine, and a fine Florence Nightingale, clear ground and bright purple flake. Fourth, Mr. E. Clinton, London. Fifth, Mr. J. Lakin, Oxford, with very fine blooms of Douglas's Agricola, P.F., large and of fine form; Robin Hood, P. and P.B., beautifully marked and bright in colour; C. H. Herbert, and the grand old variety Sportsman in fine character. Sixth, Mr. R. Makepeace, Leicester. Seventh, Mr. John Walker, Thame, Oxon. Six Carnations, dissimilar.—First, Mr. A. R. Brown, Handsworth, with Richard Bealey, Mars, Biddy Malone, S. S. Thomson, J. D. Hextall, Sportsman: a fine even lot. Second, Mr. F. Hooper, Bath. Third, Mr. George Chaundy, in whose stand were very fine blooms of Guardsman, S.F., bright in colour, and Gilbert, a seedling S.B., very bright in colour and of fine form. Fourth, Mr. C. P. Thurstan, Wolverhampton, and in this stand was a very fine bloom of Edward Adams, S.B. Fifth, Mr. H. Foxen, Leicester. Sixth, Mr. J. Edwards, Manchester. Seventh, Mr. J. P. Sharp.

For twelve Picotees, first, Mr. Charles Turner, Slough, with a superb lot of blooms, Esther, very fine, medium purple edge, and broad smooth petal; Nellie, very fine; Adolphus, Liddington's Favourite; also Premier, light edge Picotee; Lady Emily Van de Weyer, Zerlina, Mrs. Hasford, very fine; William Summers, Dr. Epps, Madeline, also very fine; Thomas William, and Lady Churchill. Second, Mr. Joseph Lakin, including very fine blooms of Norman Carr, Polly Brazil, and seedling heavy red Ne Plus Ultra. Third, Mr. E. S. Dodwell, with Little Phil, Nellie, and Mrs. Payne, very fine. Fourth, Mr. R. Sydenham, Amy Robsart, Favourite, and Brunette especially fine. Fifth, Messrs. Thomson & Co., Mrs. Herbert and Campanini, fine. Sixth, Mr. E. Clinton. Seventh, Mr. R. Makepeace. Six Picotees, dissimilar; twelve competitors.—First, Mr. A. W. Jones, Handsworth, with a bright stand of refined flowers—viz., J. B. Bryant, Campanini, Thomas William, extra fine. Second, Mr. A. R. Brown, Favourite and Becky Sharp, very fine. Third, Mr. J. Edwards, Amelia and Mrs. Geggie, very fine. Fourth, Mr. F. Hooper. Fifth, Mr. Henry Pither, Oxford. Sixth, Mr. Hy. Foxen. Seventh, Mr. F. Denning, Moseley.

Twelve yellow ground or Fancy Carnations or Picotees, dissimilar.—First, Mr. Charles Turner with very fine blooms, comprising Annie Douglas, Romulus, Countess of Jersey, Almira, Stadtrath Bail, Mr. Henwood, Victory, Adela, Old Coin, Remembrance, Sophia, and Edith M. Wynne, a bright fine yellow ground flower. Second, Mr. E. S. Dodwell with Richard Tryon, one of Benary's new varieties, a very fine flower with rich orange yellow ground colour, and bright coppery plum margin; Terra Cotta, very fine; also Dodwell's 475 and 156; other kinds were Tournament and Seedlings. Third, Messrs. Thomson & Co. with very fine blooms of A. W. Jones, Von Helmholtz, Victory, and Terra Cotta. Fourth, Mr. John Walker. Fifth, Mr. Anstiss. Six yellow ground kinds.—First, Mr. George Chaundy with Nova, very fine; Annie Ross, orange yellow ground with blue tinted lilac markings, a fine flower; Stadtrath Bail, Agnes Chambers, and two seedlings. Second, Mr. A. W. Jones with Victory, Mrs. Robert Sydenham, Stadtrath Bail, Dodwell's 191, Alfred Grey, and Brockhaus. Third, Mr. J. Lakin. Fourth, Mr. F. Hooper. Fifth, Mr. Sydenham. Sixth, Mr. Brown. Seventh, Mr. A. Spurling, London.

For twelve self Carnations, dissimilar, first Mr. C. Turner with Germania, Salamander, very fine salmon; The Governor, Rose Unique, very fine; Niphetos, Golden Fleece, Lady Mary Currie, Rose Wynne, shaded scarlet maroon (also the Premier Sel), King of Scarlets, Catherine, and two seedlings. Second, Mr. Dodwell with Purple Emperor, Mrs. Muir, Mrs. Reynolds Hole, Midas, a fine rose self; Ruby Perfection, Mrs. Fred, Tom Pinch, Emmie, and others. Third, Mr. Sydenham. Fourth, Messrs. Thomson & Co. Fifth, Mr. G. Chaundy. Sixth, Mr. Anstiss. For six self Carnations Mr. F. Hooper was first, Mr. Jones second, Mr. Brown third, Mr. Spurling fourth, Mr. J. Edwards fifth, and Mr. W. Bacon, Derby, sixth. In the class for six Carnations or Picotees for those who have never won a prize there was a large number of entries. First, Mr. J. J. Clarke, Leicester; second, Mr. A. West, Leicester; third, Mr. E. B. Handley, Birmingham; fourth, Mr. E. M. Sharp, Birmingham; fifth, Mr. E. Causer, Barton-on-Needwood.

Seventeen classes were set aside to the different sections of Selfs, and a large number of blooms were staged, but we can give only the first and second prize winners in each class—viz.: S.B.—First, Mr. E. Clinton. Second, Mr. Sydenham. C.B.—First, Mr. Sydenham. Second, Mr. Dodwell. P. and P.B.—First, Mr. C. F. Thurstan. Second, Mr. Sydenham. S.F.—First, Mr. Lakin. Second, Mr. Pither. R.F.—First, Mr. Sydenham. Second, Mr. Chaundy. P.F.—First, Mr. C. Turner. Second, Mr. E. Clinton. PICOTEES, H.R.E.—First, Mr. Chaundy. Second, Mr. A. W. Jones. H.P.E.—First, Mr. Jones. Second, Mr. Dodwell. Heavy Rose Edge.—First, Mr. Turner. Second, Mr. Dodwell. Heavy Scarlet Edge.—First, Mr. J. P. Sharp. Second, Mr. E. M. Sharpe. Medium Red or Purple Edge.—First, Mr. C. Turner. Second, Mr. R. Sydenham. Medium Rose or Scarlet Edge.—First, Mr. Sydenham. Second, Mr. A. W. Jones. Light Red Edge.—First, Mr. Jones. Second, Mr. Clinton. Light Purple Edge.—First, Mr. Clinton. Second, Mr. Lakin. Light Rose or Self Edge.—First, Mr. Dodwell. Second, Mr. Jones. Self Carnation.—First, Mr. C. Turner; also second. Fancy or Yellow Ground.—First, Mr. J. Lakin. Second, Mr. C. Turner.

For twelve varieties of Carnations or Picotees, dissimilar, five stems of each.—First, Mr. S. Rogers, Whittlesey, Peterborough. Second, Mr. F. Hooper. Third, Mr. John Walker. Fourth, Mr. W. H. Divers. Fifth, Mr. Samuel Beal. Some excellent exhibits were staged in this class, as also for six varieties, set up under the same conditions. Some excellent bouquets, posies, sprays, and baskets of Carnations were staged for the prizes offered, and there was a spirited competition for the prizes for border kinds, six varieties in bunches. Mr. W. H. Divers of Ketton Hall Gardens, near Stamford, was first; Mr. F. Perkins, Leamington, second; Mr. F. Hooper, Bath, third; Mr. S. Rogers, fourth; and Mr. S. Beal, extra. Other classes were also filled.

The premier blooms were Bizarre Dodwell's Othello, from Mr. Dodwell; Flake, Charles Henwood, from Mr. C. Turner; Heavy-edge Picotee, Mrs. Harford, from Mr. Turner; Light edge ditto, Liddington's Favourite, from Mr. Turner; Yellow ground ditto, Mrs. Robert Sydenham, from Mr. J. Lakin; Self ground ditto, Germania, from Mr. C. Turner.

First-class certificates were awarded to Mr. J. Lakin for heavy red edge Picotee Ne Plus Ultra, a very fine flower of pure ground colour, great substance, and with fine petal; to Mr. S. Beale for rose-edge Picotee Mrs. S. Beale, a flower of great merit; to Mr. J. P. Sharp for heavy scarlet-edge Picotee Scarlet Queen, a superb flower, better than Mrs. Sharp by the same raiser; to Mr. Joseph Lakin for light purple-edge Picotee Miss Lakin, a very refined flower; to Mr. Charles Turner for rose-edged Picotee Lady Emily Van de Weyer and Fancy Picotee Edith M. Wynne; to Mr. J. Lamb, Benton Joyce, Not's, for Fancy Picotee Duchess of Portland, also certificated at Oxford; to Mr. C. Turner for self Carnations Rose Unique and Rose Wynne; and to Messrs. Thomson & Co. for self Carnations Negrass and Mrs. Joseph Chamberlain. Several other very promising seedlings were staged, some already certificated at Oxford and London, but not in good character. One variety, Crayon d'Or, pale cream striped half way down the petal with pale carmine, and with fairly formed petal and good build, is a distinct and beautiful flower.

A large number of honorary exhibits were also staged, and handsome silver medals awarded to the following:—Mr. Davis, Yeovil, for Begonia blooms; Mr. Eckford, Wem, for Sweet Peas; Mr. W. Sydenham, for Pansies; Mr. J. Forbes, Hawick, for cut flowers; Messrs. Dicksons, Chester, for Roses and herbaceous blooms; Messrs. Hewitt & Co.,

Solihull, for group of plants; Messrs. Dobbie & Co., Rothesay, for cut flowers; Mr. Bailey, jun., Sunderland, for Pansies, &c. Some bronze medals were also awarded.

NEW DWARF CANNAS.

It is not often that one has the pleasure of drawing public attention to a novelty of such genuine excellence as the splendid new race of dwarf Cannas originated by M. Crozy, of which an illustration, from a photograph, appears below (fig. 19). These new Cannas, unlike many new things which are announced with a great flourish of trumpets, and then after a year or so sink into oblivion, have, as our American friends say, "come to stay." They have so many good points to recommend them that I have no fear in predicting a prosperous future for them, and I venture to say that in a few years they will be found in the ducal

FIG. 19.—DWARF CANNAS.

conservatory and the amateur's 10-foot structure, which he fondly calls by the same name.

To enumerate their good qualities—firstly, the flowers are gorgeous enough to attract attention in any society, resembling rather fine spikes of Gladioli than the older kinds from which they are descended, while the foliage is handsome enough to make them worthy of cultivation on this count alone. Then the height of the plant has been reduced from 5 or 6 feet to 18 inches or 2 feet—indeed, a plant of "Star of '91" produced a fair spike of bloom this summer when only 6 inches high, so that they may be employed in innumerable ways instead of sub-tropical bedding only, which was formerly the case.

The constant succession of flowers produced is another good point, as the same spike will go on pushing up fresh flowers from just below the faded ones for months together, if care be taken not to cut too low in removing the old trusses. Then, again, the plants die down in winter, and only require protection from frost, a great point where glass space is limited.

The cultivation of the plant is of the simplest, rich loam with a fair share of pot room, plenty of water, and a light airy greenhouse,

presuming they are grown under glass; though, of course, as in the case of the older kinds, they make a fine effect planted outside in fairly sheltered situations. While thus easily grown, the propagation by division is not so rapid as to cause any risk of the best varieties becoming "common" for many years to come, which has been the bane of such things as *Coleus*.

I might go on singing the praises of the Crozy Cannas for a column or so, but must stop for fear of the pruning scissors, and conclude by giving the names of a few excellent varieties. Madame Crozy, as yet the gem of the collection, rich scarlet edged with gold; Star of '91, closely resembling Madame Crozy, but even dwarfer in habit; Kaiser Wilhelm, rich glowing crimson scarlet, a grand colour, should be included in the most limited selection; Alphonse Bouvier, rich crimson scarlet, and a massive spike of bloom, extra; Comte H. de Choiseul, rosy purple, fine bold flower with well rounded segments; and Ulrich Brunner, dark red shaded orange.—CHAS. E. PEARSON, *Chilwell Nurseries, Notts.*

HORTICULTURAL SHOWS.

WESTWELL GARDENERS' SOCIETY.—AUGUST 1ST.

THE question as to the value or otherwise of cottage gardeners' societies has been often discussed, and there is certainly much to be said, as Sir Roger says, on both sides. It has been urged that they encourage a great deal of jealousy and ill-will, that dishonesty is, if not openly, at any rate secretly, practised, that borrowing from neighbours and exhibiting the borrowed articles as the product of the exhibitor's own garden is not an unusual thing, and that the rest of the cottager's garden is sacrificed to growing a few special things for exhibition, and so it is said better not have them. I have known societies where these things have been done, and certainly there no good was effected; indeed I have known one society where an exhibitor the night before the Show visited his neighbour's garden, and had the impudence to display the productions thus obtained as the produce of his own garden.

On the other hand exaggerated notions of their neighbours are sometimes entertained. It is not to be supposed that a man who is interested in his garden will of necessity be a sober man. I have known many sad instances to the contrary; but it does him good in many ways. It quickens his thoughts, leads him perhaps to read, occupies his evening hours during the summer months, and increases his supply of home productions. It is a home occupation, and whether in allotments or cottage gardens ought, I think, to be encouraged, provided certain lines be followed.

This Society of which I now write is entirely managed by themselves, and as I have nothing to do with it in that way I can more readily advocate its mode of working. The members are all working men, and all their officers are chosen from among themselves; they keep their own accounts, arrange their own meetings, and, in fact, do all the business. To transact this they meet monthly, and show such things as may be in season, receiving points, which are counted up at the end of the year. The meetings are held (be not shocked, my blue ribbon friends) at the public-house in the village. I had some questionings with myself on this point, but I quickly decided that they ought not to be an obstacle to my supporting it. The house is an exceedingly well conducted one; and I could not see why, if our National Rose, Dahlia, and other societies hold their meetings at a London hotel, country societies of a like nature should not hold theirs at the country inn. The meetings are invariably well conducted, no excess in drinking or other bad practices takes place; and, in fact, the Society rather helps the cause of temperance than hinders it. Were the house in any way disorderly I should at once say no, but so long as it continues to be well conducted so long, I think, may the Society hold its meetings there without offence.

Another cause of their success I believe to be that they have confined the membership to the one parish. They have flourished so well that some of the neighbouring parishes have been anxious to join them. This they have, and as I think wisely, refused. As the case is now they all know one another's gardens, and if there were any attempt to act unfairly by exhibiting things not grown by themselves it would be at once detected. This may seem a very low reason, but we must consider what a poor thing human nature is. Besides, there would be sure to be jealousies and heartburnings. There can be no doubt that our people here enjoy exceptional advantages. The village is sheltered from the north and east, and the soil is a good alluvial deposit, so that not only can our people compete successfully, as they have sometimes done with neighbouring ones, but even those who live in the other parts of it could have no chance of competing with them successfully.

Another cause of success is that they are very wide awake to the necessity of having good seeds. They procure these from one of our most eminent seedsmen (Sutton & Sons of Reading), and they are distributed amongst all the members alike. They are very keen as to novelties, and one or other of their number often goes in for these, hoping thereby to score a point or two.

Another point is that they do not allow themselves to get into debt. They secure a certain number of subscriptions from those resident in the parish and their friends. They do not look for much gate money,

but they have hitherto contrived to keep that as a reserve fund. The prizes are small, and so it is not so much the hope of getting money as the honour of winning a prize that gives zest to their competition.

The schedule of prizes is carefully arranged into two classes, one for gardeners, the other for cottagers; and that the value of the prizes is not altogether the object of the exhibitors may be gathered from the fact that the whole amount is under £10, and the number of prizes upwards of a hundred, not including special prizes offered by friends, which are open to all members. Amongst these are prizes for butter and bread.

The outcome of all this was the Exhibition held on Bank Holiday, in a tent in the Recreation Ground in the village. Like a good many exhibitions it was held in unfavourable weather. The day was showery, not such an incessant downpour as we had at Chester, but still enough to keep visitors away in the afternoon; but the evening dried up, and there was a good attendance of the villagers, who all took a great interest in it. It would be useless to give the names of the competitors or enumerate the prizes obtained, but, as an impartial witness, I may say that the vegetables were such as would do credit to any exhibition, and that the competition was very keen, especially in Potatoes.

My object in giving this notice of the Show was the hope that it may be useful to those who wish to encourage cottage gardening, and to point out the lines on which I think such societies ought to be managed, and that when certain principles are kept in view success may be fairly looked for.—D., *Deal.*

NORTHAMPTON.—AUGUST 1ST.

THE eleventh annual Show of the Northampton Horticultural Society was held on Bank Holiday, at Delapré Park, by kind permission of J. S. Bouverie, Esq., J.P. A better site for holding such an extensive horticultural exhibition could scarcely be found. The Society offers tempting prizes, consequently the competition in most classes was good. The principal class, for twelve stove or greenhouse plants, was won by Mr. J. Cypher, Cheltenham, with magnificent specimens of the following—*Erica Thompsoni*, *Croton angustifolius*, *Croton Sunset*, *Latania borbonica*, *Ixora coccinea*, *Kentia australis*, *Erica tricolor vera*, *Phenocoma prolifera*, *Stephanotis floribunda*, *Cycas revoluta*, *Kentia Forsteriana*. Mr. Finch, gardener to J. Marriott, Esq., Coventry, closely followed for second honours. His best plants were *Croton Johannis*, *Ixora Fraseri*, *Bougainvillea glabra*, and *Sobralia macrantha*. The latter was an exceedingly fine plant, and was awarded the silver medal for high cultivation.

For six stove or greenhouse plants the competition was also good. Mr. Lainchbury, gardener to C. Watkin, Esq., Wellingborough, was well first with creditable plants; second, Mr. J. Holland, gardener to W. Jeffery, Esq., Cliftonville. For a group of miscellaneous plants (open), first, Mr. J. Cypher with a light and very graceful arrangement. In the group confined to gardeners the competition was very spirited; first Mr. Jeffery, second Mr. H. Tressler, gardener to M. P. Manfield, Esq., M.P. Miscellaneous plants were also well shown, such as Ferns, Fuchsias, Begonias, and table plants.

Cut flowers made a grand display. For twenty-four Roses the Rev. W. H. Jackson, Bedford, was first; Messrs. J. Perkins & Sons, Northampton, second; Messrs. T. Perkins & Sons, Northampton, third. The Rev. W. H. Jackson was also first for twelve Tea Roses, splendid specimens.

Collections of fruit were poorly shown. First, Mr. S. Cole, gardener to Earl Spencer, Althorpe. Vegetables were a striking feature. Mr. W. Fyfe, gardener to Lord Wantage, won first honours in the principal classes, his collection of twelve in the open class closely approaching perfection. They were staged in that excellent manner for which Mr. Fyfe has long been noted. The sorts were Pea Autocrat, Beet Pragnell's, Tomato Champion, Turnip Snowball, Cauliflower Autumn Giant, Cucumber Perfection, Artichoke Green Globe, Onion Main Crop, Potato Snowdrop, Carrot Matchless, Celery Standard Bearer, and Dwarf Bean Canadian Wonder. Mr. J. Kightley, gardener to Sir Hereward Wake, Bart., was second, also showing well.

The competition in the amateur and cottagers' classes at this Show is always of a high character, and the exhibits continue to maintain their excellence. Honorary exhibits were largely and well shown by Messrs. T. Perkins & Sons and Messrs. J. Perkins & Sons.

KENLEY AND COULSDON.—AUGUST 3RD.

THE verdict of the Judges, Messrs. Whalley of Addington Park, Jeffries of Eltham, and A. Dean, Kingston-on-Thames, was that this was a remarkably neat Show. The arrangements were carried out with such good taste by Mr. W. Smith, the active Secretary, and Mr. Grant of Caine Hill Asylum, that when judging began everything was as clean as a new pin.

The trade, as usual, sent out several good groups of plants, especially Messrs. J. Laing & Son, Forest Hill; Messrs. J. Peed & Sons, Norwood; Mr. Box, Croydon; Mr. Butcher, Norwood; and the Westerham Nursery Company; and there was a very fine group of handsome plants from the Caine Hill Lunatic Asylum, which Mr. Grant had arranged. Very good indeed were the large decorative groups in competition, the best a charming one set up by Mr. Carey, gardener to Cecil Price, Esq., Kenley. The best small group was set up by Mr. Evered, gardener to R. Blenkinsop, Esq. Plants were numerous and fairly good, but cannot all be referred to. Mr. Carey had the best six Begonias, good plants, also the best Zonal Pelargoniums; and Mr. Johnson, gardener to W. C.

Straker, Esq., had the best three Caladiums, whilst the best four Ferns were staged by Mr. Westbrook, gardener to J. Young, Esq. There were many good exhibits in cut flowers, especially the boxes of bunches of hardy varieties. Dinner table decorations formed an attractive class, the best set being dressed with small yellow flowers, Iceland Poppies, Sweet Sultan, Coreopsis, and Ferns and Grasses arranged by Mrs. Beadel. Other tables were dressed with yellow coloured Shirley Poppies, Bougainvillea glabra, white Peas, and foliage of variegated Acer and Sweet Peas in dark colours.

Some good Buckland Sweetwater and Black Hamburgh Grapes, not in competition, were sent by Captain Arkwright. Mr. Evered had the best collection of hardy plants in a dozen small dishes, and also the best Melon, of very fair flavour. Vegetables in all classes were excellent. In two classes for six varieties Mr. Floyd, gardener to Mrs. Jackson, was well first, having his admirable exhibits arranged in flattish green wooden trays, 2 feet by 2½ feet; they were as nicely set up as well could be, and presented features far more commendable than the ungainly baskets so generally used. Mr. Evered showed the finest six dishes of Potatoes, Vicar of Laleham, Satisfaction, Beauty of Hebron, White Beauty, &c.; and Mr. Johnson was second with a rather smaller, but still handsome, lot of tubers. We would not omit mention of a very interesting collection of Cacti, sent by Messrs. Jas. Carter & Co., High Holborn.

During the afternoon, from the band-stand, to a good and much-interested audience, assisted by various exhibits taken from the Show, Mr. A. Dean, on behalf of the Surrey County Council, gave an address on the lessons to be learned from the Exhibition. The site of the Exhibition was a park-like meadow situate in a deep valley a few minutes' walk from the railway station.

NEWENT.—AUGUST 4TH.

THE fifth annual Exhibition of this Society was held in the beautiful grounds at Newent Court, kindly placed at the disposal of the Committee by the owner, A. Knowles, Esq., on August 4th. The fine weather induced a large attendance, and no doubt the Show was as great a success financially as it was in other respects, there being over 1000 entries. It is most gratifying to note the improved quality of the exhibits staged each year by amateurs and cottagers, the latter more especially exhibiting first-class produce.

Groups were the greatest attraction, and were a marked improvement on former years. Messrs. Roberts & Storr of Gloucester were first with a lovely group, admirably arranged. The flowering and foliage plants were finely grown and put together with great taste. A. Knowles, Esq. (gardener, Mr. G. Shaw), was placed second, and Captain Archdale, The Holts, Newent (gardener, Mr. Durham), third. The competition between the second and third was very close, causing the Judges much trouble to decide which was best. — Martin, Esq., Upper Hall, Ledbury (gardener, Mr. Bailey), was fourth, his group being rather heavy. For six Ferns Messrs. Roberts & Storr were a good first with massive plants. Second, Mr. Bailey. Roses were not shown well, and the competition was not keen. Mr. Bosly, Redmarly, was the most successful exhibitor. Asters and Zinnias do not call for any special mention.

Mr. Dawes, gardener to Lady Elizabeth Biddulph, Ledbury Park, Ledbury, was a good first for a collection of eight dishes of fruit. His Madresfield Court Grapes were magnificent, the berries and bunches being of extra size, and only required a few more days for perfect finish; Brown Turkey Figs, Melons, Peaches, Nectarines, Apricots, Plums, and Exonian Strawberries were very fine. Mr. Bailey was second with a good collection, his Grapes being a little weak. For both black and white Grapes Mr. Dawes took the first prizes, his Alnwick Seedling and Buckland Sweetwater being specially worthy of note for size and finish. Mr. Bailey and Mr. Preston, Quarry House, Gorsley, took the other Grape prizes. Messrs. Roberts & Storr were the most successful with Melons, Mr. Dawes following closely. For both Peaches and Nectarines Messrs. Dawes and Bailey took the prizes in the order named the former staging grand fruit. Mr. Dawes was first for Cucumbers, Messrs. Roberts & Storr second, both staging well. For Tomatoes Messrs. Roberts & Storr were an easy first with a dish of perfect and very large fruits, unnamed. Mr. Dawes second.

With collections of vegetables, J. Smith, Esq., The Scarr, Newent, was first for both Messrs. Sutton's and Messrs. Carter's prizes. Other successful exhibitors in these classes were Major Howe, Captain Onslow, Rev. R. Horton, and Dr. Smelt. For Messrs. Wheeler's prizes, A. Knowles, Esq., was the most successful, very closely followed by Captain Archdale and Mr. Bellamy. Good competition took place in the jam and honey classes, the exhibits being of a very high order. Prizes were given for cooked Potatoes, and excited much interest. The Committee are to be congratulated on having worked up the Show so successfully, and also on having such an enthusiastic Secretary as Mr. J. J. Clark. Long may they prosper in their good work is the wish of—
A CORRESPONDENT.

LEICESTER ABBEY PARK FLOWER SHOW AND GALA.

THIS Show, which is most admirably managed by a Committee of the Leicester Town Council, with Mr. John Burn, the Park Superintendent, as Secretary and Curator, is fast becoming one of the most important and popular in the midland counties. It is visited not only by the major portion of the best citizens of Leicester, for whom it provides an enjoyable holiday, but also by thousands of the inhabitants

of neighbouring towns and country villages, the railway companies offering special facilities by running numerous special trains. The Show has continued increasing in importance and popularity each year since its commencement some ten years back, and so long as the present able management lasts its prosperity is likely to be uninterrupted. The Park in which it is held is admirably adapted for the purpose. The grounds are extensive, and in point of keeping and beautiful embellishments are scarcely second to any in the kingdom. The river Soar forms the boundary on one side, and this is taken advantage of by the Committee to provide a series of water sports, which, judging by the thousands of people crowding the banks of the river whilst they are in progress, are immensely popular. Three excellent local brass bands discoursed good music in different portions of the park.

The Show was of generally excellent quality throughout, and sufficiently extensive to well fill five large tents. Its most meritorious features are the fruit, cut flowers, and vegetables, in all of which it is scarcely surpassed by any provincial show. The weak points are the groups arranged for effect, and the collections of stove and greenhouse plants, the prizes for these being insufficient to bring exhibitors from a distance. The result is that the display does not compare favourably with what has been seen at such shows as Manchester, York, and Shrewsbury. It is hoped that the Committee having thus far done their work so well, and made of the Show a popular annual holiday, as well as a great financial success, will take note of weak points as here indicated, and endeavour to strengthen them.

Leaving generalisation for detail, we enter No. 1 tent, where were shown the groups and collections of stove and greenhouse plants. Class 1 in the schedule was for a group of plants to occupy 100 feet superficial. Four prizes were offered—viz., £5, £3, 30s., and 20s. For these four groups were arranged (all by local growers), occupying the whole space down the centre of the tent. A want of originality was apparent in them; all of these groups were put up on the much too stereotyped plan of starting from a tall Palm in the centre and working downwards, forming a sloping bank of foliage and flowering plants closely packed together, the close packing serving to hide the pots and also defects in the plants. The first prize was taken easily by Mr. John Smith, gardener to S. Bennett, Esq., Holmedale, Stoneygate, Leicester, who had far the brightest and best arranged group, which very well deserved the honours it won. Second, Mr. George Barry, gardener to H. Snow, Esq., Glewood. Third, Mr. John Mawby, Victoria Nurseries, Leicester. Fourth, Mr. W. Calvert, gardener to G. Oliver, Esq., Hughendon, Knighton, Leicester.

In the class provided for six stove and greenhouse plants there was only a small entry, the first prize going to Mr. John Smith, whose collection contained a very fine specimen of *Abelia floribunda*, densely covered with its small white flowers. It is a plant worthy of more general cultivation. Class 4 was for three exotic Ferns, and produced good competition. The plants exhibited by Mr. John Smith, which worthily won first honours, were grand specimens. They were *Adiantum farleyense*, *A. cuneatum*, and *Davallia fijiensis*. Second, Mr. G. Barry. In the same tent were shown excellent collections of Zonal Pelargoniums, double and single Fuchsias, Tuberous Begonias, and Coleus. The prizes in these classes were pretty equally divided between Mr. H. Rogers, Gipsy Lane Nursery, Leicester; Mr. James Wright, nurseryman, Thurmarston; and Mr. John Smith.

Tent No. 2 was devoted to fruit and vegetables in the open class. In that for eight distinct dishes of fruit there were five collections staged, the first prize being taken by Mr. J. H. Goodacre, Elvaston Castle Gardens, with a fine lot, consisting of three varieties of Grapes, two bunches of each, Muscat of Alexandria, Muscat Hamburgh, and Black Hamburgh, medium-sized bunches, berries not large but well coloured; Dymond Peach, Lord Napier Nectarine, an excellent Smooth Cayenne Pine, a very fine Melon (Read's Scarlet Flesh), and Negro Fig. Second, Mr. P. Blair, Trentham Gardens. Third, Mr. J. McIndoe, Hutton Hall Gardens. Fourth, Mr. J. Edmonds, Bestwood, Notts. The names of the exhibitors are a sufficient guarantee of the quality of the exhibits. For four dishes of fruit, Pines excluded, Mr. McIndoe was first, Mr. Goodacre second, Mr. P. Blair third, and Mr. C. Slade, Clumber Gardens, Worksop, fourth. In a class for one Pine there were some good fruits shown. First, Mr. Slade; second, Mr. Goodacre; third, Mr. P. Blair. In the respective classes for two bunches of black and for two bunches of white Grapes the entries were numerous, and some splendid fruit was shown. For two bunches of Black Hamburgh.—First, Mr. A. MacVinish, Lockington Hall Gardens; second, Mr. C. Slade; third, Mr. J. McIndoe. Two bunches White Muscat of Alexandria.—First, Mr. A. MacVinish; second, Mr. J. McIndoe. Two bunches black Grapes, Hamburgs excluded.—First, Mr. J. McIndoe, with grand Alicantes. Six Peaches.—First, Mr. W. H. Divers; second, Mr. G. Barry. Six Nectarines.—First, Mr. J. Edmonds; second, Mr. J. H. Goodacre. One dish of Figs.—First, Mr. W. H. Divers. One dish of Cherries.—First, Mr. W. H. Divers. One dish of Strawberries.—First, Mr. W. H. Divers. One Melon, Green Flesh.—First, Mr. C. Slade. One ditto, Scarlet Flesh.—First, Mr. J. Edmonds. With twenty-four Tomatoes there were many entries, mostly of high quality.—First, Mr. A. J. Smith; second, Mr. J. Edmonds; third, Mr. J. Read. Currants and Gooseberries were shown in great numbers, and were generally of good quality.

The vegetables were indeed a fine display. For the collection in the open class Mr. A. MacVinish was placed first with a most meritorious exhibit, consisting of Cauliflowers, Celery, Cucumbers, Tomatoes, Peas, Scarlet Runner Beans, Potatoes, Leeks, Turnips, Carrots, and Onions, all good throughout, well arranged, and finely set up, on a groundwork of

Parsley; Mr. Underwood, gardener to Mr. R. Walker, was second; and Mr. R. Shaw, gardener to the Marquise de Saliceto, third. There were seven collections. In the class for a dish of twenty-four Tomatoes there was keen competition and a fine display. First, Mr. A. J. Smith; second, Mr. J. Edmonds; third, Mr. J. Read, gardener to the Earl of Carnarvon. Potatoes were very extensively shown in all the classes devoted to them, and were generally of very good quality.

Probably the greatest interest of the Show was centred in the tent devoted to Roses and cut flowers in the open classes. The display of Roses was magnificent, the best which has yet graced the tables of an Abbey Park Show. The weather of late having been especially favourable the flowers were in nearly all cases of very fine quality, fresh, and brightly coloured. In the principal class for thirty-six blooms, dissimilar, Messrs. Harkness and Sons were first with grand flowers. Amongst the best in the stand were Madame Margottin, Marie Baumann, Comte Raimband, Beauty of Waltham, Horace Vernet, Alfred Colomb, Madame C. Crapelet, and Duchess of Bedford. In this stand also was a bloom of the sport Merrie England, described in our report of Chester Show. Messrs. Perkins and Sons of Coventry were second in this class; third, Messrs. Mack and Sons, Catterick; and fourth, Mr. H. Merryweather, Southwell, Notts, six collections being staged, all of a high order of merit. For twenty-four Roses, single blooms, dissimilar, Messrs. Perkins & Son were first; second, Messrs. Harkness; third, Messrs. Mack & Sons. For twelve Teas or Noisettes.—First, Messrs. Harkness, with a grand lot; second, Mr. H. Merryweather; third, Messrs. Perkins. For twelve blooms of one variety Messrs. Mack were first with a superb box of A. K. Williams. Second, Messrs. Harkness, with Marie Baumann. Third, Mr. H. Merryweather also with Marie Baumann. In a class for eighteen varieties, amateurs' and gentlemen's gardeners, the Rev. J. H. Pemberton, Havering-atte-Bower, was first; Mr. W. Boyes, Derby, second; and Mr. W. Drew, Ledbury, third. Mr. Pemberton was also first in the class for twelve Roses, dissimilar, and for six Teas Mr. H. V. Machin, Worksop, and Mr. Boyes were second in those classes; and Mr. Lansdell, the Gardens, Barkby Hall, third.

Double and single Begonias, cut flowers, were well shown; the prizes going to Mr. John Forbes, Hawick; Mr. W. Lewis, The Gardens, Tintern House, Leicester; and Mr. Lansdell. There was a very fine display of memorial wreaths, bouquets (bridal and ballroom) and dressed epergnes. In each of these classes the first prize went to Messrs. Perkins, Coventry; second, Mr. W. K. Woodcock, Barkby Road Nurseries, Syston, Leicester; third, Mr. John Mawby, Victoria Nurseries, Leicester. For ladies' sprays there was keen competition and many entries. First, Messrs. Perkins; second, Mr. H. Rodgers, Gipsy Lane Nurseries; third, Mr. W. K. Woodcock. For twelve bunches of stove or greenhouse flowers Mr. P. Blair was first, Mr. Mawby second, and Mr. J. Smith third. With twelve bunches of hardy border flowers there were numerous competitors and a fine display. First, Messrs. Biddles & Co., Loughborough; second, Messrs. Laxton, Bedford; third, Mr. Lansdell; the last named being also first for twelve bunches of Zonal Pelargoniums.

The amateurs' tent was well filled with excellent exhibits in both plants and cut flowers, but space forbids details. The most successful exhibitors, however, were Mr. W. Bell, Knighton; Mr. J. Goadby, Mr. Royce, Messrs. Whittle, Makepeace, Jackson, Yeomans, Sibson, Hassell, Beal, and Ward. Amongst the numerous miscellaneous exhibits Mr. Wm. Whitehead, Secretary of the Leicester Pansy Society, received a bronze medal for a splendid display of cut flowers containing upwards of twelve dozen dissimilar varieties, including nearly all the best named varieties Show and Fancy. The flowers throughout were large, stout, and in the best possible condition. Messrs. B. S. Williams & Son, London, were awarded a gold medal for a very fine group containing a superb collection of insectivorous plants, which were extremely interesting to the public. Silver medals were awarded as follows:—To Mr. John Forbes for collections of cut flowers, Pelargoniums, Verbenas, Violas, and Pansies; to Messrs. Yarde & Co., Northampton, for collections of cut flowers and hardy border annuals; to S. Bennett, Esq., for a fine group of decorative plants; and to Mr. Salisbury, Melbourne, Derbyshire, for a fine collection of Gooseberries and Currants. A certificate was also granted to the same exhibitor for a new Raspberry named Salisbury's Seedling, a very large dark red variety apparently very fruitful. A dish of picked fruit surrounded by a large number of very heavily laden fruiting laterals was shown. It seems likely to be a very valuable addition to our not too numerous list of good Raspberries. The arrangements and conduct of the Show were very good, thanks very much to the able Secretary and Curator, Mr. John Burn.

FRUIT FORCING.

Vines.—*Early Houses*—Vines that have been forced to ripen their fruit in May or early June have the wood ripe. Some of the leaves may also have fallen through ripeness, which generally are the first formed, as these from their thin texture have poor elaborative power, so that the

buds in their axils are often ill nourished, and the show of fruit from close pruning is unsatisfactory. There are other causes for the basal leaves being shed early, such as infestations of red spider, insufficient supplies of water, and lack of nourishment. These must be guarded against, but under the best of treatment some of the lower leaves fall early from no other cause than their thin texture, whilst the laterals which are formed later have stouter foliage; these are useful, not only in appropriating surplus sap, encouraging root action, and preventing the starting of the pruning buds, but in assimilating nutrient elements, some of which find their way to the leafless buds, as is seen in their plumping and in the thickening of the adjacent wood. No attempt must be made at removing the foliage from the principal buds, nor to cut the laterals close in, as that would probably cause the principal buds to start; therefore remove the laterals by degrees and shorten some of the long shoots, preserving, however, some growth above the buds to which the Vines are to be pruned, deferring the final pruning until the early part of September.

Root Assistance.—When the Vines are weakly it is a good practice to remove the surface soil down to and fork it from amongst the roots, taking the opportunity of raising any that are deep and laying them in fresh turfy loam nearer the surface. Good calcareous loam is the best, or one-sixth of lime rubbish may be added where lime is deficient and the soil heavy. If the soil be light and gravelly, add a sixth of clay marl dried and pounded. A bushel of wood ashes and half a bushel of steamed bone meal may be added to every cartload of the loam, but these substances are best applied as surface dressings. Give a moderate watering; fresh roots will push, especially from near the collar, into the soil at once, and be in capital condition to support a good start in the Vines when the time comes round. This border renovation, also lifting, should be performed whilst the leaves are on the Vines, for when deferred until the leaves are all down the start is not nearly so satisfactory. If the weather is bright the house will need shading and keeping rather close and moist for a few days.

Midseason Houses.—The Vines have had favourable atmospheric conditions upon the whole this season, and have perfected or are ripening satisfactory crops. There is no country in which finer Grapes and cheaper can be grown than in the United Kingdom. We ought to be able to export Grapes which would meet a ready sale in the opulent cities of the Continent and in America, for in bloom, colour, superb finish and size, British Grapes are unequalled. Where the Grapes are ripe air should be freely admitted, and enough afforded at night to insure a free circulation. If water is needed supply it early on days that promise to be fine, and with a free ventilation the moisture will not do any harm, but favour the keeping of the Grapes in a sound condition. It is stagnant air—the deposition of moisture on the berries—that causes the Grapes to spot and decay. A slight shade, such as that of a double thickness of herring net drawn over the roof lights, is necessary to prevent the sun taking the colour out of Black Hamburgh and other black Grapes, especially where the foliage is thin. Grapes commencing to colour need a free circulation of air in the daytime, and enough at night to insure a change of atmosphere, a gentle warmth in the hot-water pipes often being necessary when the weather is cold or damp both day and night. Copious supplies of water and occasional supplies of liquid of a sustaining nature will be needed until the Grapes are well advanced in colouring, and then the inside border may be mulched with a little short dry material, which will absorb moisture arising from the border, keep it evenly moist, and prevent its cracking. The border, however, must not be allowed to become dry or the Grapes will shrivel, and no amount of water will restore them to plumpness, whilst the Vines are weakened, and the succeeding crop more or less prejudiced.

Late Houses.—Full supplies of water and feeding at the surface are necessary until the Grapes are coloured up to the footstalk, for many, indeed most, late Grapes appear ripe when they are only partially finished. Late Grapes take a long time to finish properly, and too early stopping the supplies of food manifests itself in the berries shrinking at a late period. All late Grapes require time; they ought now to be well advanced in colouring, then, with a circulation of warm rather dry air constantly and a thoroughly moist condition of the soil, they will swell and finish well. Poverty is the cause of Mrs. Pince not colouring, and it is the chief cause of shrivelled Muscats even before they are ripe, and of others shrinking after they have hung some time. Afford a temperature of 70° to 75° by day artificially, 80° to 90° with sun, and close sufficiently early to increase to 90° or 95°. When the sun is losing power afford enough air to insure a circulation, and allow the temperature to gradually cool, which prevents moisture depositing on the berries, as they are warmer than the atmosphere whilst the air is cooling, and this rests the Vines. The hot-water pipes should if necessary have a little warmth in them to prevent the night temperature falling below 65°. Pay particular attention to the early ventilation of the house, for when this is neglected the sun heats the atmosphere more quickly than the berries, and they become covered with dew through the moisture in the air being condensed on their cooler surfaces, therefore increase the ventilation early with the advancing temperature.

Melons.—In pits or frames the last batch of plants will have set or be setting their fruit, and it is necessary that these plants have every encouragement, for late Melons are about as flavourless as Pumpkins unless quality is developed in them whilst the sun has considerable power. Where the setting is not effected the growths should be kept rather thin, the atmosphere warm and rather dry by the aid of linings, so as to insure steady progress and the free admission of air. Plants in

hot-water heated pits should have a gentle warmth in the pipes on cold nights and on dull wet days; this affords facilities for ventilation, and a little ought to be given to prevent the deposition of moisture on the flowers. When the fruit is set the plants may be sprinkled early in the afternoon of fine days, avoiding the collar of the plants. Close by or before the temperature has receded to 80° or 85°, and so as to raise the temperature to 90° or 95°. Admit a little air at 75°, increase it with the advancing temperature to 85° or 90°, which maintain through the day from sun heat. Attend to frames for linings with sweetened fermenting materials as the nights become cold, so as to prevent the temperature falling below 65° in the morning. Place mats over the lights after the sun leaves the frames in the evening, and remove them shortly after the sun has risen. This will cause the fruit to attain to greater perfection than is usually the case with late Melons in frames.

Melons in Houses.—Fire heat will be necessary to maintain a night temperature of 65° to 70°, and 75° in the daytime. Afford sufficient water to keep the soil moist whilst the fruit is swelling, but after it is full-sized no more should be given at the roots than is necessary to keep the foliage healthy till the fruit is perfected. A too dry atmosphere whilst the crop is swelling keeps the fruit constantly evaporating and hardens the rind, causing it to crack if the weather prove moist when it is ripening. Moisture with judicious ventilation keeps the fruit in steady progress. Stop the laterals to one joint, and rub off all superfluous shoots as they show, allowing nothing to interfere with the principal leaves, or to retard the swelling of the fruit. Plants with the fruit advanced for ripening should be kept rather dry at the roots and have air liberally, with an advance of temperature, avoiding a close atmosphere at night, which after a spell of bright weather causes the fruit to crack and militates against the quality of the Melons.

Late Melons in Houses.—The plants will be put out and growing freely. The leader ought not to be pinched until it reaches the trellis, when it may have its point taken out if more than one leader is required, or if only one leader is wanted it may be allowed to advance two-thirds up the trellis and then be stopped, removing every alternate lateral on opposite sides of the stem directly they can be handled. Maintain a moist atmosphere and keep the roots well but not excessively supplied with water. Provide a temperature of 70° to 75° by artificial means, falling to 65° at night, and keep the bottom heat steady at 80° to 85°. Canker at the collar is often troublesome; it is mainly due to excessive moisture there and on the stem, and once established is difficult to subdue, but it may be held in check by rubbing quicklime into the affected parts, repeating as necessary.

THE KITCHEN GARDEN.

Celery.—Allowing the plants to attain a great size where they are pricked out is certain to weaken them considerably, much-drawn plants flagging badly when moved. All ought now to be in the trenches and growing strongly. Easterly winds and bright sunshine cause a rapid evaporation and loss of moisture, and Celery ought to be watered very freely and often, especially when the trenches are full of hungry roots, liquid manure also doing good. The evening is the best time to water, and there should be no stint about it, even those that are about half moulded up requiring abundance of water far more often than they get it. Soot freely dusted among the plants and washed in is both a good fertiliser and preventive of slug attacks, while good dustings, applied when the dew is on the leaves, will keep away the Celery fly, few or no leaf-mining maggots being seen accordingly.

Blanching Celery.—Celery required for the early shows will have been already either earthed up or bandaged round with several folds of brown paper—the latter being the surest way to obtain clean yet perfectly blanched stalks. For ordinary purposes papering round is also to be commended, though not if extra large quantities are required. Celery that is to be ready for use from a month to six weeks hence ought now to be well advanced in growth and partially moulded up, taking care that this process is not much in advance of the heart development, or bulging and splitting will result, successional rows to have the lower small leaves, suckers, and weeds cleared away, and after a liberal dressing of soot has been given this should be followed by a good soaking of water. Next day bring the outer leaves lightly up together, and chop down 2 inches or rather more of soil about them, this serving to prevent the plants opening out too much, also as a mulch, and gives something for the surface roots to lay hold of. Neglect this precaution, and the chances are the leafstalks will become set in a somewhat horizontal position, and split when drawn up together later on.

Celeriac.—Seedlings being first pricked out similarly to the ordinary Celery ought ere this to have been transplanted to a good open well manured plot of ground, or they may be planted in close succession to early Cauliflowers. Seeing that they are grown for their Turnip-like roots, the system of culture adopted should be of a character to promote such root-growth rather than the formation of extra strong leaves. No mistake will be made by planting very firmly on the level, 18 inches apart each way in the case of the old form, and 3 inches less when the Apple-rooted large Prague or other continental varieties have rightly been preferred to the former. Subsequent culture merely consists of watering freely during dry weather and surface hoeing of the ground.

Cabbage.—If the first sowing has not been a success, another ought always to be made directly it is seen that such is the case. There is also a possibility of the sowing made about the middle of July or following week being too early, and more seed should be sown during either the first or second week in August. It is a mistake to sow either in a very sheltered spot or very thickly, the aim being to raise abundance

of sturdy plants that will not require to be first pricked out into nursery beds. Pricked out plants never move so well as do those drawn from a seed bed, after the latter has been moistened thoroughly either by watering or rains, and replanted with a dibber. It is better, however, to temporarily prick out a good portion of early raised plants than allow them to spoil each other in the seed beds. Seeing that pricked out plants must be moved with a ball of soil and roots they ought to have the benefit of fine freely worked soil, anything that is hard or lumpy not answering.

Onions.—Tripolis, autumn sown, are now nearly fully grown, and in many cases would be improved in appearance and mature more quickly by having their necks boldly twisted down. Directly they come away freely from the ground, the roots having then done their duty, the bulbs are better off the ground than on, too much moisture causing them to root afresh, thereby greatly impairing their keeping properties. Harvest them well on dry walks, boards, or shutters prior to storing. The ground they come off to be surface-hoed, and at once planted with Coleworts, or quickly hearting small Cabbage, put out 1 foot apart each way. Spring-sown Onions ought now to be thickening at the base rapidly. If somewhat crowded, draw out any that do not promise to bulb well for present use; also remove any badly mildewed or grub-eaten, burning these, the rest of the crop being freely dusted over with a mixture of soot and newly slaked lime. The more advanced in growth, with their stems still erect and stiff, may well have these twisted down, the best roots and the quickest to mature being those that have small necks.

Garlic, Shallots, and Underground Onions.—Directly the tops of these have died down lift and harvest the roots. Neglect this precaution, and they will root afresh, and not keep well. These also may be followed by Coleworts, and in warm localities Savoy may yet be planted instead of Coleworts.

Potatoes.—All the early varieties ought now to be quite fit for lifting and storing. There is no necessity to wait till the tops are dead or the skins quite hard set, and clearing them off early may be the means of saving them from the disease. At present there are no signs of the latter, but it may put in an appearance after a few dull rainy days. Ashleaves ought certainly to be lifted, and abundance of medium-sized tubers saved for planting next season. There should be no attempt at greening seed tubers, exposure to light and air not unfrequently resulting in their becoming diseased. Store them thinly in a cool light shed, while those to be eaten should be placed in heaps and kept dark and cool. Potatoes maturing rather earlier than usual will afford good opportunities for close successional cropping. The ground should be well forked over during the process of lifting, all lumps being broken down, levelling and clearing it of rubbish, completing all the preparation needed for Winter Turnips, Strawberries, Endive, Spinach, Leeks, or even late-raised Broccoli, Savoy, and such like.

Winter Spinach.—Now is a good time to make a fairly large sowing of winter Spinach, more seed being sown a fortnight hence. This important crop requires and ought to have a well prepared site, anything in the shape of poor lumpy ground not suiting it. Stir not freely into the surface, at the same time reducing the soil to a good depth to a thoroughly finely divided state. Sow Victoria in drills drawn 15 inches apart, 3 inches less space usually being sufficient for the smaller-leaved prickly seeded and round-seeded varieties, both of which are suitable for present sowing.

THE BEE-KEEPER.

APIARIAN NOTES.

FAULTY COMB FOUNDATION.

"R. M." sends me a sample of comb foundation with the name and address of the dealer, wishing me to expose him in the *Journal of Horticulture*. The proper course is for purchasers to buy from dealers or firms of good reputation or on terms that would prevent purchasers being imposed upon. The foundation is principally composed of tallow, resin and a small portion of mineral or vegetable wax. One of the objects of bee societies should be to protect bee-keepers from fraudulent dealers.

OLD IDEAS AND NEW NOTIONS.

I am pleased to see Mr. Meadows appearing in a friendly attitude. I am quite aware that it is unfair to conceal anything of benefit to the public, but the frames in question were sent out by me by the thousand thirty years ago, and that is not concealment. I give the readers of the *Journal* the benefit of all useful things I possess and conceal nothing. I made an extractor different from any others, but used it so little that I destroyed it.

FEEDERS.

Some recent introductions are not so new as modern apiarians imagine. I have one I should say 150 years old made on the same principle as some of the so-called new ones, and others exactly similar to the so-called "Rapid Feeders," and have used them for

forty years or more. I show all I possess to everyone who pleases to call on me, and who, like Mr. Meadows, holds out the right hand of fellowship. It was one of the rules of our Society (broken through by dealers) that all articles new in idea and exhibited were to be registered to prevent acrimonious correspondence founded on claims of originality.

SWARMING AFTER DRONES ARE KILLED.

"J. S. Boswell" asks if I ever knew a hive of bees to swarm after they had killed their drones. My reply is, Yes. He also asks if I ever had a natural swarm in August. Again I answer Yes, and till the 15th of September.

SUPERIORITY OF PUNICS.

We have had several days' more favourable weather, but as bees do not gather honey until the temperature is at 65° to 75°, and as it has seldom been above 50° very little honey has been gathered, only as much as will put the bees in good trim for the Heather. Indeed, so bad has the season been that many hives have neither swarmed nor gathered as much honey as will carry them through the winter. It has also been of poor quality, and by the time it is sealed it will not represent more than one-third the bees gathered. In every case of weighing they lost one-half during the night that they gathered the day previous. Crossed Punics are in every case, except with crossed Syrians, the richest in honey. One prime swarm less than half a mile distant has filled nearly to completion eight 6 lb. supers; its contents being 50 lbs., this is by far the best in the district. My first test failed on account of the queen of the Punic swarm being a virgin, and the weather being unpropitious she was lost. The contents of a Carniolan swarm pitted against it are 45 lbs. This is a superior strain of the first imported Carniolans, and never sting. Another test is a pure Punic and a pure Carniolan. The former are ahead of the latter with their supers. This strain of Frank Benton's Carniolans is inferior to my other strain, and sting more readily; they are, I believe, the descendants of a cross of some sort.

Those who deny the superiority of crossed Punics might as well deny their own existence. The pure ones are good, too; but to manage them properly, and prevent them causing any annoyance, all superfluous queens and queen cells should be destroyed, so that they will work with vigour, and prevent robbing. The Punics are no worse than other varieties in this respect, but the number of queens aggravate the offence. This is the only fault I can find in them, and I state it as freely as I do their virtues. The opinions of strongly prejudiced persons can have little weight.

WHAT OTHERS THINK.

Lately several individuals have spoken to me about the strictures in another paper. One gentleman brought me three numbers of it, to show me, as he said, the spite it contained. I do not know why I should be attacked or coupled with "A Hallamshire Bee-keeper," who is personally a stranger to me. A vile accusation was printed against me, signed J. D. McNally, the Editors stating at the time that "they did not even know the writer." The charges referred to were publicly apologised for by Wm. McNally of Glenculce as "being false." I laid the case before a meeting of the C. A. Society, and Major R. J. Bennett exonerated me from every one of the charges. At this stage J. D. McNally, after denying being the author of the article, produced a letter from one or both of the Editors, urging him on with the disreputable literature. I care nothing for any of the gentlemen named. I speak and write only what I know to be true. I therefore repudiate the charges made. It would have saved Mr. Cowan both trouble and expense to have procured Punic bees in England, and tested them there. The good or bad qualities of bees cannot be known in their native country apart from other bees. We must bring them side by side in some place in Great Britain, just what I am doing in the interest of bee-keepers, not of dealers, either in Hallamshire or anywhere else.—A LANARKSHIRE BEE-KEEPER.

FERTILE WORKERS—THEIR UTILITY.

ON page 112 for August 4th, "A. L. B. K." seems to have made a discovery, and seems to think that the drones produced by fertile workers are to mate with queens.

It is now nearly ten years since I discovered and published in another journal that fertile workers and queens would live peaceably and lay eggs side by side. When I made this discovery I looked far beyond what our friend suggests for a solution of their use. I asked myself how it was that if anything happened to the young queen while on her mating trip, no means were at hand for the bees to requeen themselves? I noted many observations, and at length came to the conclusion that bees had the means of requeening themselves by means of fertile workers. I have had Punic bees rear so many queens from the eggs of

fertile workers that I am quite prepared to take my stand on the truth of the discovery. In one case a number of Punic worker bees entered a stock of queenless Carniolans and reared a queen from the eggs they laid. This queen is in the British Museum.

If "A. L. B. K." will make up a stock of Punic bees absolutely queenless, and see that there are some drones in, as these seem to be necessary, in as natural a manner as possible, compared with a stock that lost its queen on a mating trip, the bees will soon be busy laying and rearing queen cells. If any of these seem natural, i.e., not long ones, but just like ordinary queen cells, queens will most certainly be found in them, and not only so, but numbers of worker bees will hatch from worker cells. Hence, Punic worker bees have the power to raise both queens and drones from themselves. The instinct seems perfect in Punic bees, only partly so in Syrians, and quite absent in our native bees. I cannot go into the matter just now, but should like as many as possible who have these bees to confirm my discovery, incredible as it may seem.

I notice the gentleman who has acquired such a reputation for "accuracy" says these are not a new race, and were known as far back as 1885; this was the year Punic bees were first seen alive in this country. No other person, other than myself, has ever imported a bee alive from Tunis, and no other person has introduced them into this country or America. I sold the first in 1890, after first testing them, yet I am now told they are not "new." What next?—A HALLAMSHIRE BEE-KEEPER.

TRANSFERRING BEES.

I HAVE a stock of bees in an old straw skep which I should like to transfer to a Stewarton hive, as the old skep is very much worn. I should, therefore, feel obliged if you would kindly let me know when would be the best time to make the change and how I should proceed.—AN AMATEUR.

[It is difficult to advise as to when is the best time to transfer bees, this depending upon the state of the queen and the amount of brood there may be in the hive. Unless the queen is one of the current year she should not be kept. Drive the bees from the straw hive at once, then begin at one side and remove comb by comb until brood is seen; put these combs carefully aside upon their edge so as not to crush the seals. Now lay the Stewarton bars upon their top above two or more pieces of tea twine, placing the combs upon them so that they will hang in their original position. Catch the two ends of the twine, and tie them tightly or till the twine takes a catch of the comb by the dragged portions, or lay a bit of thin spale and tie over it. If there is honey in the removed combs use it and melt the others. If there is no brood turn the bees into the hive without more ado with comb foundation, but do not depend upon an aged queen, then feed up. If you have drones in plenty you might do worse than try a Punic queen; I am certain you will not regret it. I have a great deal more evidence in favour of crossed Punics. They are the best wherever they are. I shall require another season to prove the pure ones, or perhaps the Heather may do so this one. The season could not be worse to test them fairly.—A LANARKSHIRE BEE-KEEPER.]

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Incipient Cucumbers (*No Name*).—We have received a parcel containing examples of Cucumbers shrivelling instead of swelling, but no letter in reference to them.

Disqualification of Fruit (*A. B.*).—If the fruit in the collection had to consist of the same kinds alone as are mentioned in the preceding classes (as is implied but not stated so clearly as it might be), you were rightly disqualified. We doubt if the other exhibitors could have been excluded on the grounds you suggest under the somewhat unprecise wording of the schedule.

Parisian Parks and Gardens (*Frenchman*).—We have no doubt young English gardeners occasionally find employment in France, in fact we know some have done so who knew little or nothing of the

French language, but we believe they are not sought for. Wages are low and working hours long. A nurseryman who does business with a French house may possibly give you an introduction if you are well known to him.

Rosa Polyantha Seed (W. S.).—We regret our inability to give the name of the French nurseryman who sent seeds to an American cultivator as described on page 49 of our issue of the 21st ult. We are not aware that seeds are sold in England. Possibly Messrs. Vilmorin, Andrieux & Cie, 4, Quai de la Mégisserie, Paris, might be able to supply them. As you are probably aware, the charming little Polyantha Roses may be readily increased from cuttings.

Keighley Queen Raspberry (John Carter).—The samples arrived in a very different condition than you intended. Nine-tenths of the berries were spoiled, but the few uninjured were very fine, and the sprays had been loaded with them. If you consider the variety an improvement on your Carter's Prolific, as we suspect it is, good specimens should be placed before the Fruit Committee of the Royal Horticultural Society, and the variety should be added to the Chiswick collection for trial in the gardens.

Croton Leaves Falling (C. A.).—You fail to indicate the conditions under which the plants are grown. The leaves will become "spotted and fall" through (1) the attacks of insects or deleterious fumes; (2) defective root-action, the result of unsuitable soil or defective watering; (3) an excessively dry or excessively moist atmosphere; or (4) a too low temperature. With a little examination and reflection you ought now to be able to discover the cause of the evil. When the plants are properly attended to in suitable structures they develop clean, handsome, persistent leaves.

Melons (Disappointed).—So far as we understand your statement you took off the wrong flowers for pollen. Those with a swelling at the base—the embryo fruit—should be retained and pollen applied to them from the flowers that are simply borne on short thin stalks. The latter are what are called the male flowers, and it does not matter whether the pollen is applied to the fruit bearers with a small brush or not so long as it reaches the pistils of those for which it is intended. Try again, and if you have sufficient heat for sustaining healthy growth you may yet have good Melons late in the season.

Worms in Pots (H. J. H.).—You ask for reference to an advertisement for "killing worms in pots." We are unable to find a specific advertisement on the subject. Mr. A. Porter, Stone House, Maidstone, has advertised his worm excluders, and they are good for the purpose. On the front page of the last and several issues you may find an advertisement under the heading of "Slugicide." This may be worth trying. We test everything of this nature on weeds or plants of little worth before applying generally to plants of value. If any other advertisements such as you wish to see can be pointed out as having appeared in our columns, we will give the references to them if these are supplied.

Disqualified Bouquet (J. L.).—The class stipulates for the "best bouquet of garden flowers." You employed Maidenhair Fern, presumably *Adiantum cuneatum*, and were disqualified. This is certainly not a "garden flower," and the judges decided accordingly. But if they acted with equal strictness all round they would disqualify all bouquets that contained a fringe of leaves of any kind, for if used alone—that is, without flowers on the same sprays, they would be outside the terms of the schedule. Some schedules state that Fern is admissible in such bouquets, and undoubtedly a little greenery of some kind improves them. We have seen autumn-tinted Carrot leaves pleasingly associated with flowers, but under the terms of the class quoted they would not be eligible, though some judges would in the exercise of their discretion, overlook the technicality. If you had handed a written protest to the Secretary before four o'clock, the Committee would have settled the matter, as they are entitled under regulation 9. It would be better to say whether Fern is admissible or not in the class, and so avoid possible misunderstandings.

Muscat Grapes Failing (C. R. P.).—The Grapes have set badly, stoned imperfectly, and are seriously scalded. Unheated houses are not suitable for the Muscat of Alexandria, nor is it prudent to leave the door of your vinery open all night. The berries have become so cold that moisture has been deposited on them in the form of dew, and they were then injured by the evaporation that followed during bright sunny days. We are rather surprised the other varieties are doing so well, and are by no means certain they will finish as satisfactorily as is desirable. Instead of leaving the door open leave the top ventilators open to the extent of an inch or so, admitting more air in the morning when the temperature approaches 65° as indicated by a shaded thermometer. Maintain a day temperature of about 80° with ventilation, when the weather permits, and close early in the afternoon, so that that temperature is maintained as long as possible. The house should not be damped late, but the paths and other surfaces should be dry before nightfall. At that time the top ventilators may be opened a little, or the house might perhaps remain closed till too late in the morning, a too common cause of injury to Grapes in the vineries of amateurs.

Names of Fruits.—*Notice.*—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to

be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (W. W. Buseot).—We are unable to name the Peach, but possibly we might have been able to discover its identity if you had stated the character of the flowers—large or small. This is an essential condition, as was indicated on page 112 last week.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (Thirty-years Subscriber).—*Cattleya guttata* Prinzi. (R. R. P.).—No. 1 is *Gongora galeata*. We are not sure about the others in the absence of flowers or some particulars about the plants.

TRADE CATALOGUES RECEIVED.

DAIRY REFORMS.

DAIRY schools, creameries, lectures and demonstrations at agricultural shows, are among the most prominent schemes hitherto offered to farmers to enable them to effect improvements in butter making, so as to compete more favourably or upon more equal terms with French and Danish producers, whose butter is imported in such large quantities as to virtually give them the control of the butter trade in this country. It is quite true that what butter is made in British and Irish factories finds a ready sale when placed upon the market in the right manner, but this is a mere drop in the ocean, and is nothing at all like the national effort that must be made to arrest the tide of importation if we would re-establish the trade for home-made butter. The principles which underlie the successful production and sale of high class butter are so simple that there can be no insuperable difficulty in the way, always provided that it is the right one.

What the butter factor wants and will have is a specific guarantee of quantity as well as quality. Once convince him that he may rely upon a steady supply of first class butter of uniform quality, and he will buy fast enough at a price comparatively high to that given for butter of doubtful quality, with which he will have nothing whatever to do. We especially commend this fact to County Council technical committees, who among other things are striving to improve practice in farmhouse dairies. Do they comprehend all the difficulties in the way? Not simply by the instruction of farmers' daughters in dairy schools will they succeed, very much more goes to build up success than churning and working butter. The cows' food and water, the construction and management of the cowsheds, cleanliness of milkers and milk pails, the construction, situation, and surroundings of the dairy, are all factors to success or failure. Then come the questions of milk setting or separation, of cream ripening, of temperature and manipulation. To master and deal with all these things in detail there must be practical experience combined with a knowledge of the principles which underlie the work. In a badly ventilated dirty cowhouse there is not only milk contamination but there are diseased animals much more frequently than is supposed, whose innocent looking milk frequently conveys the germs of disease to humanity. In Denmark these points are so well understood that the cows and all that affects them are kept under regular government supervision; if this were attempted in this country what an outcry there would be about infringement of the liberty of the subject.

County Council's cannot deal with the whole matter without a special Act of Parliament, but they may do much by the establishment of dairy factories in conjunction with dairy schools. This probably would be a prominent feature in the curriculum of such agricultural colleges as may be established, but very little good would be done in that way compared with dairy establishments pure and simple. A conviction that dairy farming must take a much more prominent position with us in the future than it has in the past is our inducement to insist upon the importance of this matter, and we would aim at a sweeping reform, not only in cow and dairy management, but also in the provision of food for the cows. It is but the repetition of an oft-told tale to say that most of the pasture on which cows graze in summer is not half cultivated. Here is a test which will not fail anyone. Pasture which is brown and bare of herbage in winter, which gives useful growth late in spring, or which becomes bare early in autumn, is alike bad; that which is really green in winter and is the converse of poor pasture in spring and autumn is good.

One difficulty in the way of the establishment of factories is an erroneous idea of the cost. We repeat that buildings and plant should cost not more than £700, which is the maximum outlay necessary for a factory of sufficient capacity for the milk of 800 cows. If cows with land and buildings for them are required there would be a proportionate additional outlay, which is easily estimated for, but not so readily obtained. Nor is that the footing upon which it is desirable creameries should be placed. To be really useful, to promote the interest of farmers generally, it should be supplied with milk by them. This is done in the best way under a scheme of co-operation similar to that now in force in the South of Ireland. With the farmers for shareholders all difficulties about money and milk supply vanish; all that is then wanted is skilful management, and a market for the butter, both of which things are easily obtained. There may be some little difficulty at the outset in placing the butter. There ought to be. We have let the trade slip through our fingers into the hands of the foreign producer, and the lost ground cannot be recovered without special effort.

WORK ON THE HOME FARM.

Corn harvest is now in full swing in the southern counties. On August 3rd we saw Wheat being cut with hook and scythe on the Surrey hills, and Oat reaping in a similar primitive fashion a day or two later on the Essex flats. Much of the Oat straw was still unripe, but the practice of early reaping of both Wheat and Oats is highly commendable. Cut at once when the grain is so firm that no milky juice can be squeezed out of it, and then carting and staking should be easily managed. Very much corn is wasted by being left uncut so long that it is shaken off in the reaping and carting. Oats mown green into swathes require turning over once; sheaves set up in shocks should also be turned once, especially if the weather is dull or showery. In real hot harvest weather the dry air soon absorbs any moisture left in the straw, and very little turning is necessary. Let the master give an eye to the making of shocks and see that the sheaves are so well set up as to throw off rain and are not easily blown down. The making of shocks is often left till the evening, when they go up with a rush, and are not always well done.

With a continuance of fair weather there will soon be clear stubbles, over which pigs and sheep are run to clear up fallen corn. Be prompt about this, so that broad-shear, harrows, plough, and cultivator may be at work without the loss of a day. During the next five or six weeks more good may be done upon the land than at any other period of the year. Every possible effort must be made to clean the land, to eradicate all perennial weeds, and to destroy much Charlock where it infests the soil. With the surface at all loose a turn or two with heavy harrows will often work the Charlock seed sufficiently into the soil to induce speedy germination; but when the land is firm shallow ploughing becomes necessary, and when the Charlock plant is visible harrowing across the furrows destroys it and causes another crop to grow.

Take the first clean fallow that can be had for sowing *Trifolium incarnatum*; do not break it up, but sow the seed broadcast, harrow it in, and there should be a full plant well established before winter. Early sowing is essential to ensure a full crop of this useful early fodder crop. Push on ploughing for the sowing of Wheat, Winter Oats, and Rye in September.

REMARKS.

- 31st.—Sunny and warm in morning, cloudy afternoon, slight rain in evening.
 1st.—Spots of rain early, cloudy morning, generally sunny in afternoon but a slight shower at 3 P.M. and again in evening.
 2nd.—Brilliant early, generally cloudy after 10 A.M., spots of rain at 0.30 P.M.
 3rd.—Overcast morning, occasional sunshine in afternoon.
 4th.—Bright and warm.
 5th.—Sunny throughout.
 6th.—Alternate cloud and sunshine in morning with occasional spots of rain, sunny afternoon and evening.
 A rather unsettled week with a good deal of cloud but very little rain. Temperature near the average.—G. J. SYMONS.

A VISIT TO SPEDDOCH AND ITS FAMOUS VINE.

FROM a distance one would hardly imagine that such a lovely place as Speddoch was hidden away among the bleak hills that border the valley of the Cairn. The road from Dumfries, running for the first five miles through the open country, enters this mountainous district at Irongray Church, where the prototype of Jeanie Deans is buried, and where the country parson once ministered to a flock scanty enough to leave him leisure in plenty for his recreations. Then the country becomes wilder and more rugged. On one side are rounded hills, now beginning to put on their imperial mantle of purple Heather, while across the river are thickly wooded slopes, a solid mass of greenery, save where the grey rock appears through the foliage. Mountain streams cross the road at intervals, the dark brown waters of which show the colour of the peat moss, and testify to their origin in the moorlands.

Nine miles from Dumfries the traveller turns aside through a gate, no more pretentious than a dozen he has passed on the road, into a long avenue of Limes and Chestnuts, and soon the quaint old mansion of Speddoch is reached. At first there is apt to be a little disappointment with the long low house devoid of all architectural adornment, to say nothing of the rococo finery of the modern country dwelling. But there is a quiet beauty, a charm of retirement, that gradually steals upon one as the noise of the wheels on the gravel dies away, and the protecting presence of those great trees begins to be felt. In that sheltered nook no rude wind may blow. On the uplands around the storm may rage in all its fury, but down in the valley there is peace. It is not surprising to learn that many plants, which are too delicate to thrive anywhere in the neighbourhood, are to be found at Speddoch in perfectly healthy growth.

On that plain two-storeyed house, for instance, are creepers such as one finds in the favoured climate of the South of England rather than among the bleak hills of Scotland. On one end is a fine plant of *Aristolochia siphio*, which in summer covers the entire gable with its beautiful large foliage, while the other end is clad with the purple blossoms of an old *Wistaria*. Half of the front is covered with a noble *Gloire de Dijon* Rose, yielding upwards of fifty blooms daily for many weeks every summer, and the other half is divided between a splendid specimen of *Clematis Jackmani* and an enormous plant of *Chimonanthus*, the flowers of which scent the whole house in winter when it is in bloom. We are told that within there are many wonderful things in the shape of ancient carved oak furniture, curious weapons, valuable books yellow with age, and antiquarian treasures of many kinds.

Our business, however, is not with the house itself and its contents, but with its surroundings, and we gladly accept the leadership of Mr. Smith, who has been gardener at Speddoch for over twenty years, and knows every plant and tree as one knows the friends of his youth. He points out to us the extensive view, comprising glimpses of the Lowther Hills and the distant cone of Queensberry. He calls our attention to a magnificent purple Beech, the bronze foliage of which shows in fine contrast to the greenery around it; to an Oak of beautiful form, with top rounded as if regularly trimmed, the stem, a yard above the ground, measuring 12 feet in circumference; to a Douglas Spruce, only some thirty-five years old, which yet measures 100 feet in height, though it has lost its top more than once, with branches coming

out from the stem only 6 inches above the ground, which cover an area 60 feet across; to another Oak, with a girth of 15 feet; to some fine specimens of *Picea Lowi*, *Sequoia gigantea*, and *Abies Albertiana*, as well as to a collection of Hollies of a size and variety such as one seldom sees.

Then we enter the garden and make our way over the trim gravel walks direct to the house which contains the famous Vine. As we go Mr. Smith tells us of the great anxiety he had for its safety in spring. *Phylloxera* attacked the smaller Vines in the adjoining house, and they had to be removed with much care and labour, and all the soil carted to a distance. The work of purification occupied many weeks, but fortunately the old Vine remained unharmed, while the young plants with which the victims of the disease were replaced are thriving satisfactorily.

This year the ancient Vine bears a crop of Grapes far surpassing that of any previous season, and Mr. Smith is so well satisfied with it that he declares himself prepared to challenge the world. The Hampton Court Vine may possess a greater antiquity, and its branches may cover a wider area, but the size and flavour of its fruit and the weight of its crop are far inferior to this. The Manresa Vine at Roehampton may send its rods to a distance of 224 feet from the parent stem, and hang out its seven rows of bunches in their purple pride, but at best it is only an unwieldy giant, producing, with all its acreage, a crop inferior in weight, and fruit inferior in size and flavour, to those of the Speddoch Vine. The Vine at Kinnell, much as its praise has been spoken, must yield to its Dumfriesshire rival, and concede to the Speddoch Vine, with the best grace it may, the honour of being the finest Vine in Britain.

The story of the Speddoch Vine reads like a romance. Its parent was the historical Vine at Hampton Court. Somewhere about the beginning of the century the grandfather of the present proprietor, Mr. Clark, visiting Hampton Court while pruning was going on picked up some pieces which were lying on the floor, and asked if he might have them. His request was, of course, acceded to at once, and an eye being planted in the usual way the Speddoch Vine was the result. The house in those days was quite a small one, only 20 feet long, and it was occupied by several other Vines. But this scion of the Hampton Court Vine made headway, and one by one the others were removed, till in time it had the whole place to itself, and soon its abode had to be enlarged by the addition of 20 feet to the house. Its rapid growth continuing more space still was required, and the present house was built over the old one in 1871. It is a very substantial structure, measuring 60 feet by 20, and it might have been made much larger but for the conformation of the ground. The front parapet consists of two courses of Ashlar freestone, with freestone mullions, from which rafters 26 feet in length extend, supported in the centre by tubular pillars of malleable iron. The stem of the Vine, which, as anyone who knows the Hampton Court Vine will be aware, is of the Black Hamburg variety, is at one end of the house. Its girth at the ground just before it branches is 2 feet 4 inches. There are thirteen rods, together with one grafted rod of the Buckland Sweetwater, and these extend, not horizontally, as is often the case, but vertically. The Vine, with its clustering bunches, now in beautiful colour, is wonderful to see. The bunches are not distributed at wide intervals, as in so many Vines which make a great assumption of superiority, but are set close together, so that when viewed from one end the roof seems a solid mass of purple fruit. This season the bunches number considerably over 500. The smallest of them cannot be much under 2 lbs. in weight, while some of the largest must weigh 4 or 5 lbs. and upwards. The weight of fruit obtained last year was considerably over 1000 lbs., and those who are best qualified to judge estimate that this season there will be at least 200 lbs. more. "By their fruits ye shall know them!" Manresa and Kinnell may boast their branches spreading under yards and

yards of glass, but with it all where are they when the bunches come to be counted and the fruit to be weighed? Can either of them, with all their bulk, produce 1200 lbs. of such delicious, large, well-flavoured Grapes as this Speddoch Vine in its little house of 60 feet by 20?

This old Vine has had several marvellous escapes from utter destruction. More than once it has suffered the ordeal by fire. On one occasion in its early days it came very near being entirely consumed. One Sunday morning the gardener having made a good fire owing to the weather being cold, banked it up well and set off to go to church three miles away, leaving his wife with instructions to see that no harm happened to the vinery. But, busied with her household affairs, the good woman forgot all about her charge, and when the gardener returned he found that in his absence the flue had taken fire, and all the Vines in the house were destroyed except this, which happened by good luck to be in the cool corner. Once again, when the new house was being erected, an impatient mason in endeavouring without assistance to remove the lintel from the old door tumbled it over on the leading branch, which was, of course, irretrievably ruined. Then a superstition used to prevail in the neighbourhood in favour of burying the bodies of dead donkeys at the roots of a Vine, as the most appropriate manure it could have. So all the creatures, dogs and cats and other animals as well as donkeys, that died within a radius of a mile or two were brought religiously to nourish the roots of the old Vine. When the present gardener came his first care was to effect a thorough pruning of the branches, and when that was done to look to the roots. The border was duly trenched, and, sure enough, the bodies which had been brought to the spot were found in a putrid mass. There was not one root of the Vine near them. As soon as possible the evil stuff was removed and replaced with good loam, and no more defunct pets were allowed to find their last resting place there.

Mr. Smith has something to say about the honours he has won in past years at the horticultural shows in Edinburgh, Glasgow, Dundee, and Dumfries. Once he took a prize with a bunch of Grapes 9 lbs. in weight, believed to be the second heaviest bunch of the Black Hamburgh ever exhibited. He mentions a curious instance of the uncertainty of judges which occurred in 1884, when he was awarded the second prize at the International Show at Dundee, while at Edinburgh a week later he carried off the first prize from the previously successful competitor. It is now a good many years since Mr. Smith ceased to exhibit.

Leaving the house containing the old Vine, and passing through the span-roofed house in which the phylloxera made its appearance in spring, noticing how the young Vines are flourishing, and noting the large specimen Ferns ranged on the tables, we visit next the potting house, the fruit room, and the well-lighted boiler house. Everywhere we observe the same substantial fittings, and the same convenient arrangement of accessories. The windows of the fruit room are of obscured glass 1 inch thick, so that the temperature within is little affected by the temperature without; while the fruit tables and shelves are of foreign maple—a wood free from all resinous odour. In the boiler house are two large Meiklejohn's cruciform boilers, which can be used together or separately as required. The heat is regulated by a convenient arrangement of Messenger's patent valves.

These all adjoin the house where the old Vine has its habitation. Passing now into the open air, a few steps lead us to a second span-roofed house. It was originally intended for a Melon house, but is now occupied by five Vines of Alicante and Gros Colman, which, planted at one side, are trained right over the span. They bear an enormous crop of heavy bunches, with berries of an unusual size. Another house contains Vines of Muscat of Alexandria, and I was struck with the length and weight of the tapering bunches, which seem extraordinary for Vines not more than six years old. In these two houses, which

open into one another, we had barely time to glance at the Ferns and bright-foliaged plants, such as *Gesnera zebrina*, which crowd the tables, or the Tomatoes trained against the walls, or at the Fig tree in the corner, but were compelled to hurry on to the Peach houses, where we found such a grand crop of Victoria and Lord Napier Nectarines, that we felt as much inclined to compliment Mr. Smith on his success with this fine fruit, as on his unparalleled crop of Grapes. Then we walked through the garden, remarking how well the wall fruit was thriving, protected as it is in places with a glass coping; noticing the great rockery, 120 yards in length, with its wealth of Alpine plants and Ferns almost concealing the enormous boulders of conglomerate and the blocks of shining felspar brought all the way from the mines at Wanlockhead; admiring the showy flower borders with their cleverly contrasted tints; and out into the cool shade of the giant trees, where there was something new to observe.

We took our stand on the tennis ground, and noted how well its oval shape fitted into the steep ascent which rises beyond. All around were a great variety of magnificent trees, some standing singly, some planted in groups, including specimens of *Araucaria*, *Thuja gigantea*, *Cedrus deodara*, *C. atlantica*, and *C. libani*; *Picea nobilis*, *Normanniana*, and *pinsapo*; *Abies excelsa aurea*, *Douglasi*, *canadensis*, and *Albertiana*. Then through the midst of these we took our way along a grassy path, past a large pond where only the leaping trout disturb the placid water, past the extensive kitchen garden, and on to the lovely Speddoch Glen, where we found a shady retreat from the blazing summer sun. We crossed a deep and rocky ravine on a neat footbridge supported by iron girders resting on substantial stone piers. Even now the scanty stream betrays by its brown waters its origin in the moorlands. As we followed the path we noticed the natural rockwork with Ferns—the Oak, the Beech, and the Lady Fern—growing in wild luxuriance. Then we recrossed the stream by a bridge similar to that below, and retraced our steps through woodland alleys to which the lofty *Picea nobilis* lends a marvellous dignity with its stately form and glistening bark, and before we were aware we found ourselves at the summer house on the height overlooking the tennis ground, with the gardens, the house, the grounds, and all their wealth of arboreal beauty spread out at our feet. Far away we caught once more a glimpse of Queensberry, dim in the distance as a summer cloud, and, stretching in the other direction for miles, we could follow the valley where lay the road to Dumfries. And so once more we bade farewell to Speddoch, conscious that we had seen only a part of the beauties which, like some coy maiden, it hides away in its secluded glen.—KARMI.

VIOLAS AND PANSIES.

I SHOULD like to add a few remarks on Violas to those on pages 48 and 118, and also to give some notes on new Fancy Pansies exhibited this summer.

NEW VIOLAS.

Other new Violas to be sent out which have come under my notice as worth having are Prince of Orange, deeper in the yellow than Bullion and a fine variety; Rob Roy, rich gold with a bright brownish red blotch in the top petals, both to be sent out by Messrs. Dobbie & Co.; and Duke of Clarence, rich velvety black violet, with light clouded upper petals.

Another lot of blooms of seedling Violas has been sent to me by Mr. J. D. Stuart of Belfast, who is devoting much attention to Violas, and I append a few notes of some of the best of those he sent to me. H. W. Stuart is a very richly coloured beautiful flower of good size, perfect form and substance, colour maroon purple clouded and striped with rosy lilac; a beautiful variety. Mrs. Joseph Chamberlain is another fine and distinct variety, having the good properties of H. W. Stuart, but much lighter in colour and distinctly clouded with lilac; a beautiful variety. Hibernia is a flower of first-class quality, admirable in form and substance and smooth, rich violet lower petals, and greyish lilac top petals; extra fine. Unionist is a rich deep plum purple with blue-tinted lilac blotches, somewhat resembling Master of Arts in colour, but a larger flower. Commodore is very distinct in

colour, a bright tint of dark shaded blue lilac, with a light blotch in the centre. The flowers are large and rather coarse, not possessing the refinement of the preceding varieties, but it would be grand in a mass as the colour is so bright, striking and distinct. 77/91 is a greyish tinted white with faint purple stripes, very large and thin in substance. I am doubtful if this flower would stand much hot weather. It is quite distinct and will please many. Lady Dufferin is deep in body colour, and distinctly flaked with very pale purple. It is a quite distinct and very pretty variety. Laverock is a seedling from Skylark or Blue Cloud, and is exactly the same type of flower, but pure white with a narrow even margin of sky blue on each petal, and not so broad or deep in colour as is Skylark or Blue Cloud; it is a charming variety. Colleen Bawn is the same style of flower as Laverock, but with only a Picotee edging or margin of very pale blue, a quite distinct and pretty variety. Mr. Stuart also sent blooms of his Golden Flake, an excellent pure Yellow self, but I think identical with Prince of Orange, to be sent out by Messrs. Dobbie & Co. I can see little or no difference in the flower. On the 9th inst. I received from Mr. Samuel McKee, a Belfast merchant, and like his friend Mr. Stuart, a votary of the Viola, a box of blooms of seedlings, and it is evident that Belfast is coming to the front with sterling new varieties. These were all under numbers only, so that it is of no use to your readers to refer to them here beyond saying that one is a fine variety of the Quaker Maid type, another an improved Hugh Ainslie, and another a Sunrise style of flower. Two or three others also very fine.

A long spell of dull showery weather, with an occasional thunderstorm, and about thirty hours of continuous rain on the 18th and 19th of July, brought out in a wonderful degree the lasting power of the Violas as outdoor decorative plants. Whilst other portions of the flower garden were dull the Violas everywhere were in superb condition, and folk now wonder why they have so long been insensible to their beauty and great value.

Amongst the more recently introduced kinds I may just mention as well worthy of notice the following sorts:—Countess of Elgin, a greatly improved John Burns, and a beautiful flower; Dorothy Tennant, H. M. Stanley, Golden Gem, Bridesmaid, Countess of Wharnccliffe, William Niel, Master of Arts, Duchess of Fife, Spotted Gem, Lady Amory, Cottage Maid, The Mearns, Hugh Ainslie, Neptune, Princess Beatrice, Rosie Clark, Wonder, Mr. Charles Turner, Mina Baxter, Ethel Baxter, Wonder, Sir Joseph Terry, Marchioness of Tweedale, and others.

NEW FANCY PANSIES.

At the Exhibitions at Birmingham, Leicester, and York, where Pansies are specially encouraged, some very fine seedlings have been seen, to which certificates have been awarded, and the varieties will be sent out in the autumn or spring of 1893. At the second annual meeting of the Midland Counties Pansy Society there was a fine display of the newer kinds, the Scottish growers, Messrs. Smellie, Irvine, and Campbell, and Mr. Bailey from Sunderland, showing extensively. Mrs. D. Johnson, shown by Mr. Smellie, Busby, Glasgow, is a fine back row flower of great size, form, and substance, with rich violet top petals, and with a very large solid blotch of the same colour with clear white margin. William Watson (Smellie) has rich blue violet top petals, a grand clean solid blotch, with small primrose belting; a very fine flower. Mrs. B. Smellie (Smellie) is a Miss French style of flower and fine. Arthur Frater, shown by Mr. William Frater, Linlithgow, has a clean solid blotch with rich deep primrose belting of the lower petals and deep blue lilac top petals, and is of fine form. John Knox, shown by Mr. Irvine, Tighnabruach, is an Allan Ashcroft style of flower, but much brighter and a great improvement on it. It is a flower of first class properties. A certificate was also awarded to Mr. Wm. Sydenham, Tamworth, for a rich gold Fancy Tamworth Yellow, of fine form and substance and dense solid blotch.

At the Midland Counties Exhibition the following Fancies were generally shown, and fine:—David Rennie, fine everywhere; Mrs. David Allen, Kate McArthur, Maggie A. Scott, Agnes Mormon, Mrs. R. S. Niven, William Adam, Lady Duff, Maggie Douglas, Louis Westers, Bella Johnson, Betsy Kelly, James S. Irvine, Lord Tennyson, a fine flower; Jeannie Paterson, Mrs. Train, very fine; and Henry Eckford; all prize flowers. Mr. Irvine was also awarded a first-class certificate for a lovely primrose self Show Pansy, Winnie Irvine, a very refined flower.

At the Leicester Pansy Show Lord Randolph Churchill was to be seen very good in some of the stands. Neil McKay and Tom Travis were frequently met with, and always good. May Hynd, Neil Gillies, Lord Hamilton, Mrs. Hugh Weir, and David Strachan, in addition to those already named, were frequently seen at both exhibitions in fine condition. Mr. Irvine staged at Leicester some very fine newer varieties—viz., James S. Irvine, a richly coloured flower, with superb large solid blotch, and of the finest form and substance; Mr. John McConnell and Lord Hamilton, two well-

known, fine sorts; Mr. W. Dean, a fine attractive flower of excellent properties, white with large blotch, and petals flushed with blue lilac; Lizzie Irvine, very rich in colour; that fine older variety Donald Morrison; Robert Jamieson, a superb flower of the style of Donald Morrison, and very fine; and William Scott, a very fine flower with claret top petals, superb blotch, smooth, and of fine form. Tom Travis, grand in its massive blotch was fine everywhere; so, also, was George Anderson, rich gold, with bright bronzy-brown top petals, and superb dense clean cut blotch. Maggie McPhail is a charming and distinct flower of fine form and substance. Alexander Duncan is something like Lord Hamilton, but distinct and very fine. Archie Scott, in the style of J. J. Ashton, with grand lower petals and the side petals shouldering high and close, is a first-class flower. Mrs. D. Pinkerton is the finest white I have seen, with very dense, clean cut blotch. Alexander McCrossan, in the style of Allan Ashcroft, but brighter, is a grand flower in form, size, and substance. Helen Vallance is a very fine flower, with a little of the Lord Hamilton character in it. Mina Scott is much brighter than Archie Buchanan, a splendid flower in form, substance, and blotch. T. Morton is a distinct, very fine flower, deeper in colour than James S. Irvine. George Irvine is a rich crimson, velvety tinted flower, of finest form and substance; and Captain Steel is another richly coloured flower of excellent properties.

Pansies were well represented at York in all the classes, the three stands for forty-eight dissimilar Fancies, open to the trade growers, being especially fine. Mr. A. Bailey, jun., Sunderland; Mr. Campbell, Blantyre; Mr. J. Smellie, Busby, Glasgow; and Mr. Irvine showing prominently. Interest was largely centred in the class for twenty-four new Fancy Pansies, the first prize being a handsome gold medal presented by friends of the Midland Counties Pansy Society, and this was won by Mr. Andrew Irvine; second, Mr. Campbell; third, Mr. Smellie. The Show Pansies were scarcely up to the average, but some good blooms were to be seen. The amateur classes were well filled, and many fine blooms were staged, the principal prizewinners being Mr. Archer of Sunderland; Mr. Robt. Mann, Shadwell, Leeds; and Mr. Thornton, Bradford.

First-class certificates were awarded to Mr. A. Irvine, Tighnabruach, for twelve seedling Fancies, which ought to have been named, but were not; also to the same exhibitor for Show Pansy Winnie Irvine, previously alluded to; also to Mr. Campbell for two fine Fancies, Dr. Bostock and Maggie Douglass; to Mr. Smellie for William Watson and W. B. Smellie; and to Mr. Wm. Frater for Andrew Frater. Mr. Campbell had a bloom or two of a seedling Fancy Mrs. Mackie, a very fine variety, but three blooms were necessary to receive a certificate.—W. DEAN.

OPEN-AIR PEACHES.

I LOOK upon our outdoor Peach crop as the most certain of hardy fruits, for the reason that we are enabled to give the blossoms protection at the most critical period—the time when they are fully expanded. For this reason I think that the outdoor Peach crop is more at command in the majority of neighbourhoods than any other. There need be no difficulty in annually obtaining a full supply of good bearing wood thoroughly set with flower buds if a few simple rules are observed—at least I have none, and our soil is heavy and cold enough. We have Peaches growing in various aspects—south, east, and west; and all succeed alike. I have many times been surprised at the heavy crops we get from one tree on an east wall. It is very much exposed to east winds, which give us an annual full crop of “blister;” but the trees grow out of it in an astonishing manner. This they would not do were the roots not in a satisfactory condition, and the wood of the previous year thoroughly matured. The border in which the trees are growing is 11 feet wide. The part specially set apart for them, and which has not been dug over or moved in any way for the last ten years, is 4 feet wide. The surface is, in consequence of the constant treading to which it is subject in attending to the trees, something like macadam, so hard is it. The space in front is occupied with herbaceous plants. No doubt some roots from the Peach trees are running into this, and as we trench this border every third year for the benefit of the herbaceous plants the trees receive a root-pruning, which is to their advantage, checking exuberant growth.

The main point in disbudding the young growth is not to take off too many shoots at a time and to leave rather more than are really needed eventually until the trees have recovered from the “blister” with which they are annually affected. A fault in outdoor Peach culture is the laying in finally of too many shoots; 4 inches between each is not too much space to allow, but more frequently only 2 inches is what is allowed. Directly the trees are

cleared of their fruit they ought to be pruned, cutting out any branches which would be removed at the spring pruning; those left are then afforded more space for becoming thoroughly matured. Another error committed is that of not taking prompt measures to rid the trees of insects the moment the latter are seen. If green or black fly attack the points of the shoots and are allowed to remain until the leaves are coiled up and the point of growth crippled before the remedy is applied how can the trees be expected to perfect a crop of fruit or lay the foundation for another year?

Water is too often withheld from the trees, not only when they are in full growth but after the fruit is gathered, not only at the root but over the branches also. When in full growth Peach trees require a large supply of water to give the best results, and after they have perfected their fruit several thorough soakings at the roots will be an immense advantage to enable the trees to plump up their bloom buds for the following year should the weather be hot and dry during September. It is surprising what an amount of moisture a brick wall will absorb from the soil, and this is all at the expense of the trees. During hot weather the trees should be thoroughly drenched with clean water in the evening, which not only checks the spread of insect pests and keeps the foliage free from dust but cools the bricks for the night, which must be an advantage to the branches and leaves of the trees. Mulching the surface to prevent the evaporation of moisture is important, but this may be carried too far to the detriment of the trees by excluding the sun from warming the soil, which is an important factor in Peach culture. Directly the trees are fastened to the wall in the spring some lay on a thick coating of manure, and there it remains until it vanishes from decay. This is a wrong method to pursue for the reasons stated above. If there is a prospect of a long spell of bright dry weather then a mulching of light stable manure to maintain the surface in a moist state will be an advantage, but mulchings should only be employed for this purpose.

In strong soils the application of stimulants to the roots must be attended with care. Giving too much is a mistake, as strong sappy wood is the result, and that is not needed; rather the reverse, as such growth is liable to gumming when a severe winter follows a wet summer. I never give stimulants to the roots until the fruit has passed the stoning period, and then but once or twice. More reliance is placed on abundance of clear water with a mulching of horse manure after the stoning stage is passed. In the case of light sandy soil the trees need more attention and assistance when swelling a crop of fruit. A thorough soaking with liquid manure once a fortnight during dry weather would not be too much.—E. MOLYNEUX.

HARDY FLOWER NOTES.

Some Troublesome Plants.

NOT the least of the many pleasures to be derived from a true love of flowers is that which we enjoy when, as Wordsworth has it, we are "in silent or in pensive mood," or are oppressed with physical weariness, and turn our thoughts to the flowers we know and admire. And this pleasure is increased tenfold when, at these times, we can bring to mind the associations and legends attached to them.

LILIUM CANDIDUM.

To none of the flowers of the garden do these words apply in a greater degree than to *Lilium candidum*, the Madonna Lily. The other night, when somewhat weary, my thoughts turned to a fine mass of this Lily which I saw in a neighbouring garden a day or two ago, the Lily of the Virgin, of which the old Calendar said—

"From Visitation to St. Swithen's showers
The Lillie white reigns queen of the floures,"

as the emblem of purity has been inseparably associated with the Madonna, not only from the legends long current, but from the custom of the old painters of limning upon their canvases this Lily alongside of the figure of the Virgin. It is said, with the Rose, to have occupied her tomb when opened after her resurrection by St. Thomas; it is said to have been a crown of Lilies which was worn by Judith when she went into the tent of Holofernes; it is the flower of Juno produced from some drops of the milk which escaped while she was suckling the infant Hercules; it has been celebrated in the orders of chivalry; has been written of in poetry and prose, and has so entered into the arts that its absence would leave a sad void. If its value in the past has been so great in the religion, the art, and the literature of olden times, its value from a garden point of view remains unequalled and unimpaired. Whether

in the gardens of the palace or of the cottage, the Madonna Lily is admired by all, and he who cannot grow it in his garden loses a pleasure he can hardly afford to lose.

Easily as this Lily is cultivated in some gardens, in others it is by no means a success. It is one of those which, I must confess, always disappoint me in my garden; but though this is so I have every hope that some day or other I shall hit upon some successful method of cultivating it. I am the less inclined to despair of success when I recollect how well *L. testaceum*, which is understood to be a hybrid between *L. candidum* and *L. chalcedonicum*, does here, and when I see it in a neighbouring garden, with, so far as can be seen, a similar soil. Although I have frequently spoken of this Lily I return to it now in order that I may advise those who wish to try it to procure their bulbs as soon as possible. Its growth is made very early, and it should be planted almost immediately after flowering. As to the soil in which to plant, it ill becomes one who has been unsuccessful to speak of it. I should, however, advise in light soils a fair quantity of cow manure to be added to the soil, but not in contact with the bulbs. In heavier soils, provided they are well drained, *L. candidum* seems to do well.

As to the disease which brings dire disappointment to the hopes of the grower, who can dogmatise? Some of the "cures" which have been applied to the useful Potato have been tried with the Lily, and with more or less, but generally less, success. In some cases the flowers were saved, but the foliage was hopelessly incurable. In this case I should say the gain was a doubtful one. It can hardly be expected that a bulb which has flowered while its foliage has never been fully capable of fulfilling one of the essential purposes of its existence should remain in full vigour, and I should think as a matter of eventual gain it would be well to take off the flowers before opening. Then, again, if this Lily is grown as an ornamental garden plant, what is it worth with ruined foliage? So far as I have seen the conditions which seem favourable to the spread of the Potato disease seem to affect the Lily, and this season it appears to be more than usually healthy in this district. If I am not mistaken the Rev. C. Wolley Dod has had some trouble with this disease, and I trust he may find it convenient to give us the result of some of his observations.

IRIS STYLOSA.

Having gone so far into one's troubles and disappointments with plants, I may as well continue in the same strain, and notice a few others which are not very successful either here or elsewhere. Among these is *Iris stylosa*, a most beautiful Iris, which in some catalogues is alluringly described as flowering at a period of the year when we have little else outside. I must say, however, that although my garden is in a favoured spot as regards climate, and as regards soil is highly suitable for winter-flowering hardy plants, I am unable to bloom this without giving glass protection from October until after the flowering period in January or February. I believe this experience applies to the vast majority of gardens. If I am not mistaken it flowers unsheltered in the garden of the Rev. H. Ewbank in the Isle of Wight, but in most gardens it requires to be specially cared for by covering with a handlight or other glass protection during the period already indicated.

PLUMBAGO LARPENTÆ.

Another troublesome and disappointing plant to many is *Plumbago Larpentæ*, so favourably noticed on page 97 by "D. Deal." I fear with most cultivators it must be written down as flowering too late to be satisfactory unless covered with glass also. I have tried it in several positions, but cannot get it to flower in the open in time to prevent it being cut down by early frosts. But then I am a long way further north than your able contributor, and although we have a mild winter I daresay our frosts come a little earlier. But I mean to make one more attempt with *P. Larpentæ*, and should another year leave us among our flowers I hope to report success at last.

ZAUSCHNERIA CALIFORNICA.

This is another plant giving much the same results as the *Plumbago*, and it, too, is about to receive a last chance, for, as a rule, I care but little for those flowers which require to be coaxed into blooming by such special means. It grows and flowers very well on a wall in some gardens, and I mean to have a trial of it in this position and see if I can flower it regularly thus. Another flower which gives me some annoyance from its shyness is

CROCUS SATIVUS.

The old Saffron Crocus is a fine thing of its kind when in flower, but which has long been noted as being very unsatisfactory

in some gardens, and highly satisfactory in others. We have many such instances among flowers, and such things will, I suppose, remain a mystery to us. Were it not so a great deal of the pleasure of gardening would be gone, and it would be less of an art than it now is; but all the same we all seek a royal road to growing certain plants, and find this road unattainable. Well, I am sorry to say, of all the Crocuses in my garden—and they are numerous—*C. sativus* is the most troublesome, only giving me a flower occasionally, and then the treat is a great one, so fine are the curious blooms, with their stigmas hanging to one side. Canon Ellacombe in his "Plant Lore of Shakespeare," p. 272, gives his experience of it thus:—"In some places it entirely refuses to flower, as it does in my own garden, where I have cultivated it for many years, but never saw a flower; while in a neighbour's garden, under apparently the same conditions of soil and climate, it flowers every autumn." A hazel loam, resting preferably on chalk, was, in olden times when it was grown for commercial purposes, considered the best for *C. sativus*.

AQUILEGIA GLANDULOSA.

One more note on *Aquilegia glandulosa*, and I must quit the subject, which is by no means an enticing one, but is useful withal. This fine Columbine is one which I have "loved and lost," but have lost, as I believe, from lack of attention. It is a plant which likes a light soil, with some cool manure within reach of the roots, and a good supply of water before coming into and while in flower; indeed, I have found it require a fair supply of water even after blooming in this light soil. It was due to inattention in this that I lost my last plants, for it is no easy matter to keep all the moisture-loving plants going in a dry season here, where there is no water supply save from the garden well. Even with the best of care *A. glandulosa* is by no means a long-lived plant in most gardens, and where a mixed collection of *Aquilegias* is grown it is not always that the seedlings come true. With all these plants if one cannot hold forth the certainty of success, there is this to be said, that all are worthy of trial, and if failure occur no one need be ashamed of it, while if success should result the flowers themselves will be sufficient reward for the labour and anxiety they may require.—S. ARNOTT.

LÆLIA PUMILA.

THIS exceedingly pretty and very dwarf Orchid became known to horticulturists in 1838, being described in that year by Sir W. Hooker in the "Botanical Magazine," t. 3656, as *Cattleya pumila*. It is a native of Brazil, growing on trees at considerable elevations. The flowers are about 4 inches across, solitary, and droop slightly; the sepals are slightly reflexed; the petals are broader than the sepals; all being of a fine rosy purple. The lip is large for the size of the flower, three-lobed, the side lobes forming a tube which encloses the column; the middle lobe is reflexed and crisped, and in colour a deep purple. The flowers are borne on slender pseudobulbs about 3 inches high; the leaves are solitary, stout, 4 inches long by 1 inch broad. *L. pumila* var. *Dayana* was discovered in 1876, and was named after Mr. John Day, in whose collection it first flowered. The variety *præstans* is rather difficult to cultivate, and is not often seen in flower; it is earlier, and has more yellow colouring than *L. pumila*. Though requiring little compost to grow in, these *Lælias* require great attention as to watering; they should be placed in small baskets and suspended close to the glass in the *Cattleya* house. A higher temperature and plenty of moisture should be given during the growing season. August and September is their time for flowering.—C. K.

LÆLIO-CATTLEYA INGRAMI.

WE are constantly reminded of the close connection between the two genera *Lælia* and *Cattleya* by the crosses between them

that are exhibited. Of these there is now getting to be a considerable number, and several are undoubtedly great acquisitions. The latest example may justly be classed with the best of them, being a hybrid of great distinctness and beauty. It has been raised by Mr. T. W. Bond, grower to C. L. N. Ingram, Esq., Elstead House,

FIG. 20.—LÆLIO-CATTLEYA INGRAMI.

Godalming, and is the result of a cross between *Lælia pumila* *Dayana* and *Cattleya aurea*. The influence of the former was evident in the dwarf habit of the plant, which was only 6 to 8 inches high, but it must be remembered that it was a small one. The flower is very remarkable for the colouring of the lip, which reminds the observer of *Cattleya aurea* in form. It is a very deep and velvety purplish crimson, not in any sense a red, but much more inclining to purple, and the colour extends right into the throat. The sepals and petals are rosy mauve, the latter being much broader than the former and wavy in outline. The plant only bore one flower, and it will be very interesting to note its character when stronger, but its merits were sufficient to secure the award of a first-class certificate. Fig. 20 represents it.

MILTONOPSIS BLEUI SPLENDENS.

THIS new Orchid is a garden hybrid raised in France by Monsieur Bleu, and it is the most distinct and beautiful among many hybrids of great promise which he has produced. It has attracted great interest, apart from its beauty, from the fact that it is the first hybrid *Miltonia* ever produced. It is the result of crossing *Miltonia vexillaria* with *M. Roezli*, plants which a few years ago were found rather difficult to cultivate, and were generally known as *Odontoglossums* of the *Miltonia*-flowered type, in which class were included *Odontoglossum Phalænosis*, *O. Roezli*, *O. vexillarium*, and *O. Warscewiczii*, all of which are now recognised as *Miltonias*.

It was only in the spring of 1872, after failures by Hollis and Roezl, that Chesterton succeeded in delivering live plants of *Miltonia vexillaria* to Messrs. Veitch & Sons, one of which, and the first one to flower in cultivation, flowered in February, 1873, in Messrs. Veitch's establishment. Roezl succeeded in 1873 in delivering one solitary plant of *Miltonia Roezli* to Mr. Bull of Chelsea, for a large price, and this flowered in December the same year, and created as much sensation as *M. vexillaria* had the previous spring. Thousands have, however, been imported since that time of both varieties, and have become so popular and well known that no description of them is necessary.

The plant of *Miltonopsis* raised by Monsieur Bleu was secured by Mr. Sander of St. Albans, who called it "a marvel," and from him Mr. Ames acquired a part of the plant.

It is intermediate in character and habit between the parents, and I think will prove of good constitution. The plant now carries two flower-spikes of three flowers each well above the foliage. The flowers measure in length $4\frac{1}{4}$ inches, and the lip $3\frac{1}{4}$ inches across. The sepals and petals are full, as in *M. vexillaria*; the base of the petals is suffused with delicate rosy purple on white ground; the lip is large and flat, bilobed in front, and of a delicate white colour, faintly veined with pink; the base of the lip light chocolate, with twelve to fifteen radiating lines about an inch in length, of a deeper colour, while the three lines on the crest are of a reddish brown. We have grown this plant at the warm end of our *Odontoglossum* house, near the glass, and close to where we grow plants of *Miltonia vexillaria*, and it receives the same treatment as regards potting material, temperature, &c., which is given to *Miltonia vexillaria*. The plants should never be allowed to get dry, and yet care should be taken not to give them too much water while they are resting. The temperature should be kept at about 60° night and day, or 55° in extreme cold weather, with free ventilation. They should be moist continually, and the plants kept well up to the light, but not in direct sunshine.—W. ROBINSON, *North Easton, Mass.* (in "Garden and Forest").

CARNATION NOTES.

THE CARNATION MANUAL.

THE publication of the *Carnation Manual* is an excellent idea admirably carried out. It is not a small pamphlet of a few pages in a paper cover, but a substantial volume well printed and bound, full of useful and interesting information. A reference to the chapters will give an idea of its character. The Rev. F. D. Horner opens with a preface, pleasantly written like all his work, Mr. Douglas follows with "Carnation Seed and Seedlings," Mr. R. Dean discourses on "Propagation," Mr. Martin Smith on "Border Carnations," Mr. Robinson on "Carnations in the Flower Garden," Mr. Herrington on "The Culture of Garden Carnations," Mr. Martin Smith gives a "Calendar of Operations in Connection with Border Carnations," Mr. Martin Rowan writes about "The Carnation as a Town Flower," Mr. J. J. Keen on "Carnation Culture for Exhibition in a Small Garden," Mr. R. Sydenham on "The Carnation in the Midlands," Mr. B. Simonite on "Dressing and Staging the Carnation and Picotee for Exhibition," Mr. Keen gives a calendar for exhibitors, Mr. M. Campbell and Mr. R. P. Brotherston treat on "The Carnation in Scotland," Mr. F. W. Burbidge on "The Carnation in Ireland," Mr. Douglas on "The Yellow Carnation and Picotee," Mr. Harry Turner on "Tree or Winter-flowering Carnations," Mr. J. Jennings on "The Culture of Winter-flowering Carnations," Mr. Douglas gives a calendar of operations with Trees, the Rev. H. H. D'Ombraïn treats the flower retrospectively, Mr. Martin Rowan deals with "Diseases and Pests," and a selection of varieties is given founded on lists supplied by several leading growers.

Here are dishes of Carnation fare that should satisfy any lover of the flower. There can be no attempt to criticise all, but we dip lightly into Mr. Horner's chapter, and quote his words on the florists of the past and present:—

"In the retrospect of a long florist life, such as mine has well-nigh grown to be, I can see, amid grey memorials of many a veteran florist, the tiny footstones, as it were, of those who, though perhaps still living men, have yet as florists 'died in their infancy.' Not as lying here, shall we count those whose love for favourite flowers has outlived their powers to tend them; or who, in the chances and changes of life, have no longer either time or garden space available. We look on men like these as with us yet; and times come round with flowers, and old friends meet over old favourites, and we feel we are not parted."

We also extract a portion of Mr. Martin Rowan's warm praise of the Carnation as a town flower:—

"That the Carnation is second in beauty and interest only to the Rose is admitted on all hands, and a 'close second' to the Queen of Flowers its votaries may not unjustly claim for it. If Nature has denied to the Carnation all the sumptuous beauty of the Rose, she has bestowed on her to very lavishness the not less precious gift of variety; for in the diverse qualities characteristic of the many classes of the flower—in the brilliance and force of the scarlet and crimson bizzars, the tenderness and grace of the rose and purple flakes, the delicacy and refinement of the edged Picotees, the rich colouring of the selfs, the picturesque and almost infinite contrasts of the fancy and yellow-ground flowers—we have a range of varied beauty hardly to be found in any other flower; while with the Cloves we have, in addition to their rich hues, a fragrance of their own not inferior to that of the Rose itself.

"With the townsman, indeed, the Carnation must hold not the second, but the very first place in his regard, for while the Rose—like many another old favourite—refuses to dwell within the smoke circle,

the Carnation will put on its best for us even in the smallest of town gardens. The great manufacturing towns of the Midlands and of Lancashire and Yorkshire have all their knots of enthusiastic and successful cultivators of the flower. At Sheffield, in one of the worst of climates, Mr. Simonite has raised some of the finest varieties of Carnations and Picotees that we possess; and all Mr. Dodwell's finest seedlings, up to the time of his removal to Oxford a few years ago, were raised within ten minutes' ride of Victoria Station. My own flowers are grown in the same locality, and, indeed, the bulk of the exhibitors at the great metropolitan and provincial shows are amateurs with town gardens, cultivating their plants under all the citizen's wonted disabilities of bad climate, cramped space, and scant leisure snatched from busy avocations of every sort."

We are pleased to learn that the Southern Section of the National Carnation and Picotee Society has been strengthened by a substantial increase in members; but it is not by these alone or educated florists alone that this excellent work will be welcomed; it will find as its possessors most persons who grow and admire Carnations as garden flowers, for all will find it useful, and it promises to remain for some time the standard work on the subject to which it is devoted.

DUCHESS OF PORTLAND.

I AM sending you flowers of this promising new variety of Fancy Picotee raised and shortly to be distributed by Mr. Joseph Lamb of Burton Joyce, Notts. It was shown by him at Leicester on August 2nd and received a certificate of merit. On the same day it received a similar award at Oxford, and at Birmingham on the 6th inst. a special certificate, and a similar award at the Notts Horticultural and Botanical Show on July 27th. On the card placed with the blooms shown at Leicester the raiser states, "It is a large flower of vigorous hardy constitution, good calyx, strong grass, and clove scented. I have been cutting flowers since the middle of February, in all ways it is doing well and proving itself of great merit with common treatment." In a letter of his now before me he says, "At Leicester the judges call it a Carnation, also at Nottingham; at Birmingham a Fancy Picotee, also at Oxford. One old gardener calls it a Clove and some a Picotee. Who shall decide when doctors disagree?"—W. K. W.

[It is not a true Picotee. The colour is on the edge, Picotee-like, but it consists of short, thickly disposed rose flakes, not a wire, and inasmuch as some of them run into the petals it might be classed as a Carnation. It is a flower of medium size and excellent form with good petals.]

CARNATIONS AT SLOUGH.

It is natural that the footsteps of Carnation lovers should turn to Slough whenever an opportunity offers itself, for Mr. Turner's great nursery there is a famous home for the noble flower. Imagine 4000 plants grown in pots, all the best, and many new varieties being included amongst them, and some conception may be formed of the extent, beauty, and interest of the display, but it must be seen to be fully appreciated. During the latter part of July and the early part of August the collection is magnificent. We paid a somewhat late visit, but were not too late to find a rich and brilliant display.

The collection of florists' varieties is large and complete, good examples being observable of such standard varieties as Admiral Curzon, Dr. Hogg, Robert Houlgrave, Squire Potts, Harrison Weir, J. D. Hextall, Rifleman, Sarah Payne, William Skirving, Mayor of Nottingham, Lovely Ann, and Thalia amongst Carnations; and of Dr. Epps, J. B. Bryant, Thomas William, Clara Penson, Zerlina, Edith D'Ombraïn, and Favourite amongst Picotees; but the Selfs, Fancies, and Yellow Grounds are a still richer display. These are growing rapidly in general popularity, and it is satisfactory to observe the sterling additions that are annually being made to their number. Of the choice varieties at Slough Countess of Jersey, a yellow ground, with light rose edge, is an admirable flower. Mrs. Arthur Barrett, which was certificated at the last meeting of the Royal Horticultural Society, is an example of a type of flower that is rapidly springing up with closely disposed flakes along the edge in place of a wire of colour. As these are confined to the edge it can hardly be classed as other than a Picotee. It is a yellow ground, with scarlet edge, and extremely beautiful. Nellie Bath is another example, and is a yellow ground, with a very heavy crimson edge. It is a beautiful flower, and a great acquisition. Salamander and King of Scarlets are a pair of splendid selfs. The former is brilliant rose, the latter bright scarlet, and both are large, substantial, finely formed flowers. Duchess of Sutherland is a white ground, with a rosy pink flaked edge, breaking somewhat into the petals, so that it ought perhaps to be classed as a Fancy Carnation. It is a charming flower. Optimus is a new yellow ground Picotee, with light scarlet edge. Remembrance, which was certificated on the 9th inst., is a lovely yellow ground, with light rose edge, and has a broad, smooth petal.

Annie Douglas, another yellow ground, with a bright rose edge, is a grand bloom.

A fresh departure is marked in the variety Old Coin, which was certificated on the 9th inst. It is a flaked flower on a yellow ground, the distinctive colours being crimson and rose. It is very distinct, and many will consider it beautiful, while it lasts wonderfully well. Romulus is a yellow ground with a deep rose suffusion. Victory is a yellow ground Fancy Carnation flaked with red, handsome and free. Ruby is a superb ruby self, with a fine petal and shapely bloom. Rose Wynne is very fine and distinct in colour, being a rich velvety purplish crimson, and has a broad smooth petal. Rose Unique is lustrous, rosy pink with excellent petal. Lady Mary Currie is a fine rose flake which runs into a magnificent rose self. It is difficult to say which is the more beautiful. Mr. Clements is a fine primrose self, distinctly paler than Germania and with many of the good points of that grand flower. Iver White is a remarkably pure self and very free flowering. It should prove to be an excellent border variety. We noted these as a few good things picked out from many others in passing through the houses, but after all they are only a fragment of the splendid Slough collection, which grows in numbers and beauty every season.

BEGONIAS AT BEXLEY.

IN a tranquil retired spot close to Bexley Heath, hemmed in by cool shady lanes, and apparently far from the City smoke, is Crook Lodge, in the nursery and fields attached to which a Begonia home has been established by Mr. T. S. Ware. It is a delightful house, creeper-covered, as all houses should be; a cool, retired dwelling that the passer-by would find a word of admiration for, and then proceed on his way. But there is a keynote struck of the treasures within, for the neat front garden is all ablaze with noble Begonias, and involuntarily he stops to make a fuller inspection. There are Begonias everywhere; the house is half clothed with them, the garden is full of them. They shine and shimmer in the summer sun, a glory of scarlet, orange, rose, yellow, and white; not common material poorly grown, but having the hall-mark of high quality about them, and in magnificent condition. Those unaware that a cutting of the great Tottenham tree had been struck here and become firmly rooted would wonder what the meaning of it was, and conclude, perhaps, that he had dropped by chance on the retreat of some amateur with Begonias on the brain, who gratified a not ignoble taste with a lavish hand.

For all its countrified air Crook Lodge is not so far from the metropolis. It is reached, inspected, and returned from in the course of an afternoon without difficulty. Those who do not object to half an hour's walk should take the train from Charing Cross, Cannon Street, or London Bridge to Bexley, and if the day be fine they will find the walk through the Kentish corn fields and fruit gardens not the least pleasant of the day's experiences; but if it is wished to avoid this, a train to Woolwich Arsenal and a 'bus from the Station door will between them carry the visitor through with a walk of 20 yards at the outside. It is a matter of taste as to which be chosen; both are pleasant and in bright weather enjoyable, while when the end is reached and the visitor is safe in the hands of that illustrious dignitary Mr. Pope there is no fear that he will have occasion to regret his journey.

I need hardly dwell on the reasons that induced Mr. Ware to establish a Begonia nursery at Bexley Heath. Doubtless he thought he perceived an opening for a profitable business in the great tuber, and with characteristic thoroughness went to work to establish one. A capable man was secured to conduct the enterprise, and expense was not spared in putting it on a sound footing. Although but a short time has elapsed since a start was made successful progress has to be recorded, and the sagacity of the Tottenham directorate receives one more proof. The quality of the varieties and the excellence of the culture bestowed on them are manifest directly the inspection is begun. A magnificent house of singles is the first one to be entered, and with the serried ranks of superbly bloomed plants it is a splendid sight. The habit of the plants is of the highest order. They are a sturdy, self-supporting race, with huge flowers borne well above the leaves on substantial stems. In glancing from plant to plant, noting their fine qualities and robust healthy appearance, it is impossible to resist a hearty "well done," for assuredly there is material for any raiser and grower to be proud of.

One of the first to arrest attention is Pride of Bexley, blush, large and very free, with stout flower stems raising the blooms above an ample canopy of foliage. Bexley White, pure white with a faint rose edge, is large and fine. Goliath is a grand orange with very large flowers and handsome foliage. Moravia is conspicuous for its rich crimson flowers. Leonora is a lovely carmine, very rich and free, certainly one of the most beautiful, though not the largest. Velleda is a fine yellow, bright in colour, and very free. Purity is an excellent white, a profuse bloomer, and with long stems. Venus, carmine with white centre, has the good qualities of pleasing appearance and abundant floriferousness. Superba is a high-class scarlet, very brilliant in tone, and Dean Swift is another equally vivid in hue, with well-rounded flowers, like a good Zonal Pelargonium. May our leading raisers give us many more like it, and so replace by degrees with

superior material the old pointed-petalled, quartered flowers. A note of praise must be sounded for Marginata, pure white with deep rose edge; and also for Devon, a very fine yellow with salmon centre, the flowers borne on enormous stems. Crimson Bedder is small but full of bloom. The habit of the plant quite reminds one of a Persian Cyclamen, for the flowers are borne erect above a cluster of evenly disposed leaves. Here again we have a model for exhibitors to work by, particularly with a view to bedding material. Nerissa is a rosy pink, charming in colour, large and fine. Blushing Bride is a soft pink, but drooping with quite excessive modesty. In Perfection, orange, we have another beautifully rounded bloom, and Sovereign possesses the same quality of good shape allied with a rich yellow hue. Shelley, rosy crimson with white centre, has long pendent stems, and was evidently born to adorn a basket. Bicolor, white, tinged with yellow in the centre, claims the triple attraction of a rosy margin. Bexley White is a magnificent variety, combining purity of tone with perfect roundness, large size, vigorous stems, and freedom of blooming. We cannot have too many like it. Challenger, rich purplish crimson; Alba Fimbriata, white, noteworthy from the petals being deeply dentated; Angola, lovely pink; Zanda, salmon; Lord Byron, scarlet with white centre, and Sunset are other beautiful singles. The latter is fiery orange with a glow about it that at once suggests its name.

There are many more fine singles, but the collection of doubles is also both large and fine, and the choicest of the varieties must have their turn. Duchess of Teck is a grand yellow, having good flowers and a fine habit. Miss Jeannie Fell is a delightful rosy red, Camellia-like in form, and as graceful and shapely as any of them all. Princess May, white and with crimped petals, is a beautiful companion to it. Baronne de St. Didier, also with crimped petals, is of a clear sulphur hue. Victory is a fine Hollyhock-like scarlet. Triumph is a splendid crimson, still hard to beat. Mrs. F. Fell, salmon, is a fine handsome flower. Alba Magna is a grand white of fine habit. Picotee, blush with yellow centre, is noteworthy for its clear rose edge. Claribel, salmon with white centre; Marquise de Trevis, blush with a rosy suffusion; Henshaw Russell, scarlet, a very free bloomer and of good habit; Messina, salmon, full of bloom; Comtesse O'Gorman, clear canary yellow; and Una, rosy pink, are all excellent. Beauty of Belgrave, a silvery pink, Camellia-like bloom, of good habit and very free, is beautiful and striking. It would be interesting to know whether Mr. Gumbleton thinks that it merits its name, for his standard of excellence is high. Pavona, pink, has fine form and pleasing colour to recommend it. Solferino, sulphur with rose tip, is distinct. Serica is a charming button-hole flower, but I hardly care to venture on a description of its colouring. Duke of Teck, brilliant scarlet-crimson, a fine Hollyhock-like flower; Alice Crousse, soft pink; and Procida, blush, are a trio with which my notes may worthily conclude.

It is noteworthy that large pots are not believed in. The largest size used is 24's, and many of the best plants are in 48's. The visitor should not leave without inspecting the field where 200,000 Begonias are bedded out. It is wonderful to see, with the broad masses of bloom in all the unexampled richness of colour which these noble flowers command. They are splendidly grown, full of bloom, and in great variety. To describe them would be impossible, and it needs the full strength of a burning reflection that less than half an hour remains to reach a station nearly two miles away to turn from the flowers and say farewell.—W. P. W.

REVIEW OF BOOK.

LAND: ITS ATTRACTIONS AND RICHES. *The Land Roll Office, 3, Lincoln's Inn Fields.*

AMONGST a number of books that have long awaited notice, which the pressure incident to the show season has hitherto precluded, is one of considerable size and importance under the above comprehensive and attractive title. It embodies the work of fifty-seven authors, and is edited by Mr. C. F. Dowsett, F.S.I. Probably it has proved a somewhat costly undertaking; and it seems to contain matter of interest on almost all subjects connected with the land. There is a good deal in the book of a controversial character, but a great deal more of general interest to landowners, and not a little that may be fairly regarded as of substantial value to landworkers.

Instead of enumerating the chapters in the book we prefer to take brief extracts from some of them as indicating its character, and which may be suggestive or interesting to our readers. Thus, Dr. W. B. Richardson, in treating on "Health in Relation to Land," says:—

"Agriculture provides aliment for health. But it does more; it provides health for the body; it is, indeed, the great factor of health. As agriculture declines perfect and typical health declines, and a people that had no land in cultivation would soon be as poor as the land itself. Our great cities and towns are the markets of the world in respect to material things and produce; they are the markets also of health—no less, no more. We have to send our produce into the markets, and we have to send our health there from the country—from the land. Health is a crop good or bad, according to its cultivation. It may be bad although it be bred in the country and on the land; but it thrives best when the land thrives best, as if the two were one and the same. In the eyes of the sanitarian land is the test of health. Good land, rightly cultivated, is the cradle of health for all crops, animal or vegetable."

Passing many pages we come to a few lines in a chapter on the "Pleasures of Country Life," over which gardeners may ponder, some perhaps with advantage, and not less so the owners of gardens:—

"The garden for the gardener' is a theory that many a younger member, at least, of the country dwelling families has resented, and it is one indeed that brings an unbearable tyranny. But how comes it to exist? Because the gardener, too often, is the only person who knows what should be known about a garden—its fruits and vegetables and seeds, its flowers and frames (hot and cold), its forcing houses with their delicate crops of Melons, Pines, Peaches, and so forth. There is, indeed, some pity for the gardener whose efforts are only appreciated in the results he produces, in the fine flowers and the well-flavoured fruits he can bring to table, and yet whose efforts are sometimes frustrated by 'young Miss,' whose nimble fingers act the part of procurer to her longing eyes. But if young and old alike had some intelligent interest in the raising of flowers or fruit from seed, the pruning of fruit trees, the management of plants, and all the thousand other matters that make a garden interesting, there would be less tension between gardeners and their employers, and there would be a source of pleasure perennially open to dwellers in the country."

Dr. Alger points out in his chapter a somewhat anomalous position into which civilisation has led us. He says:—

"On the score of wealth, when broad acres were first given to man had he any accessories whatever? Had he not to gain his bread by the sweat of his brow, to work early and late, to hunt and fish for his food before he could eat it? Thence, onward, through cycles of years has he gone on working and toiling, anon being assisted by the springs of civilisation, until now in this the decade of the nineteenth century we find him being fed by others, his own bodily powers having been carried by the forces of his long-life history to other kinds of motion, all, however, making up that mysterious phase that we call life. This, we say, is the result of our civilisation, our intercourse with other countries, our interchange of ideas. Well, be it so! But does it follow that we are bound to let others feed us with the produce of their lands, while our own broad acres are lying wasted and wasting?"

Mr. Gilbert Murray has a few strong words to say against deep cultivation, but by this he means soil inversion, or covering the surface of land with hungry subsoil, and he treats scientifically on soil improvement as follows:—

"The chief object of cultivation is to bring the atmospheric air into direct contact with the chemical constituents contained in the soil, the most valuable of which are nitrogen, phosphoric acid, potash, soda, lime, and magnesia. Before the nitrogen of the soil can be utilised by plants it must first be oxidised. The object of cultivation is to bring the atmospheric air into contact with the nitrogen in the soil, which takes up the nitrogen and forms nitric acid; this chemical change is chiefly performed in the soil through the agency of living organisms which are present in the soil in myriads. Recent discoveries in plant nutrition have opened up a new and interesting field of investigation. There can be no nitrification without the aid of living germs; these are admittedly of a low order of life, the oxygen of the air is of itself sufficient to sustain their operations; darkness is also requisite for their activity. This will explain to the cultivator the advantage wherever practicable of stirring, rather than inverting the soil; the action of these microbes and their operations cease at a temperature slightly above freezing, and cannot endure a temperature of more than 100°. They are most active in their operations a few inches below the surface, and practically become inoperative at a depth of 10 inches, hence their activity is greatest near the surface. This is clearly apparent in the development of young fruit trees of five or six years' growth where mulching or surface manuring has been practised. Within a few inches of the surface there is a complete network of slender roots, or spongioles, whilst not a root has penetrated the soil beyond a foot. Where no surface manuring has been practised the trees are sending down tap-roots to a considerable depth into the subsoil. In waterlogged soils these organisms are destroyed, hence the effort of the scientific cultivator is to have the land drained, keep the manure near the surface, and wherever practicable, to keep the soil frequently stirred."

Writing on the depreciation of land (which he evidently regards as a reaction on inflated values), and on the future prospects of farmers, Mr. W. E. Bear, an admitted authority, writes:—

"I am far from desiring to represent the prospects of farmers in too optimistic a manner. They will possibly have a struggle for years to come, and they will need the advantages of moderate rents and many improvements in the economy of farming and marketing to which references will be found in other parts of this volume. It must not be forgotten that the enormous advance of rents which followed the Russian war did much to produce the crisis which made land for many years a drug in the market. Landlords and farmers alike were greatly injured in the long run by the war prices; but neither such prices nor the mad scramble for farms at any rent will be likely to recur. What is to be looked for is moderate agricultural prosperity, with its natural consequence, an improved demand for land. I believe that capital sunk in land at present prices will prove an excellent investment, and that farmers who take leases at current rents will have reason to congratulate themselves a few years hence. There is much to be done by Parliament, by landlords, and by farmers themselves to bring farming in this country under the most favourable conditions for its full development, but if all

who are responsible in this connection will co-operate in efforts for the advancement of agriculture, there will be every reason to count confidently upon the prosperity of the oldest and most important of all industries."

Among the writers on fruit culture as improving the value of land we find Mr. J. Wright. After strongly denouncing the promulgation of fabulous profits, based on the prices of prize fruits or an unusually productive tree, he still goes on to say:—

"There is no known case where the best varieties of hardy fruits have been planted in appropriate positions and fertile soil of good staple during the past ten years in this country, and the trees and bushes have made good progress under good culture, that the value of the land has not been substantially improved. That broad general fact is significant and encouraging. There is not a land agent or valuer in the kingdom who can say that plantations of thrifty young fruit trees, either in the bearing stage or approaching it, do not increase both the letting and selling value of properties on which they are established. Ancient orchards of debilitated trees in inferior varieties planted in bygone generations may, and doubtless do, give a 'bad character' to land; their woe-begone appearance is depressing and suggests poverty of the soil, which they have, in fact, long since deprived of the essentials to healthy growth and productiveness. It has to be remembered, however, that those orchards and trees do not represent culture but neglect, and the natural concomitant of this always has been, is, and will be depreciation in the value of land in those rural districts where it can only be devoted to the production of food for the animal world and the human family. Young trees possessing vigour of growth, and branches studded with spurs and bold buds, the certain precursors of blossom, have an exactly opposite effect; they represent "culture," and impart a value to the land they occupy that it could not possess under ordinary agricultural tillage. This is proved to demonstration, not in Kent only, but wherever a well-conducted system of fruit culture has been in operation during the past few years. Where no mistakes have been made in planting, or after management, the results have been such as to lead to an extension of the practice as capital was forthcoming and more land could be acquired, while there has been a great increase in the number of fruit growers in those districts where profitable object lessons have been afforded to enterprising pioneers."

Such growers as Messrs. Bunyard, Rivers, Baillie, and others are mentioned in this connection; and Mr. H. A. Bond of Swanley, in an able and suggestive chapter, gives expression to similar views, sensibly observing that—"Although fruit growing is being profitably conducted as a distinct industry, attention is here directed to it as an adjunct to mixed farming rather than as a substitute for it. It would be idle to suppose that fruit growing can prove a panacea for all the ills of the farmer, but it may aid him greatly in his perplexity."

These few extracts denote the nature of the work on those particular questions, but there are dozens more treated by able men, and it may be expected that "Land: Its Attractions and Riches," will find its way into the libraries of landowners, cultivators, and others who are interested in the various aspects of the great and undeniably important subject in which they are embraced. The volume is a substantial one, well printed, and considering its size (900 pages) cannot be regarded as expensive.

FUNCTIONS OF VINE LEAVES.

MR. IGGULDEN'S remarks under the above heading, on page 115, will have been read with interest by Grape growers, as they were by myself. My experience is quite in accord with his as to stopping laterals—namely, that there is no advantage in stopping these more than two leaves beyond the bunch. I have at present under my charge Vines planted little more than 2 feet apart, and it has been my practice this last dozen years to stop all the strongest laterals at the bunch, leaving none beyond, the medium at one leaf, and the weaker two or three leaves from the bunch. I think when a lateral is stopped at the bunch the sap is forced into it, and gives it a vigour in its early stages that it would not otherwise have. The sub-lateral at the bunch is allowed to make two or three leaves before being stopped, which is generally enough to fill the limited space at command. In my younger days I was taught to take out all the sub-laterals between the rod and the bunch. This I think is a great mistake, and now I only stop them when they are getting above the leaves on the lateral. If stopped once they do not often break again, but the few leaves they make are a great help to the smaller leaves at the base of the laterals to produce plump buds where they are most needed at pruning time. With these sub-laterals properly managed there will not be much to complain of as to the bunches getting smaller or fewer through the laterals being shortened in the way spoken of by your correspondent.

Mr. Iggulden's experience as to cutting bunches with a good part of the wood with them for exhibition does not agree with that of Mr. Roberts. That gentleman, in a paper read at a meeting at Brighton two or three years ago in connection with the Fruit Growers' Association, and subsequently published in these pages, stated that when he was an exhibitor of Grapes he could not but notice that he very frequently cut his best bunches for this purpose from the same spurs; and from this he concluded that a partial shortening of the laterals after the fruit was cut was a practice to be commended. To let a little more light into

a house after the crop is cut I think is most desirable. It raises the temperature of the house without fire heat on warm days, so necessary for the ripening of the wood; and if there are healthy foliage and sub-laterals at the base of the shoots there need be no anxiety about cutting away the green tips of the laterals to attain that end. By doing so the buds to be left at pruning time have a better chance of swelling, and will break freely in spring.

With what Mr. Iggulden says about laying in unnecessary lateral and leading growths I quite agree. It is now, I daresay, nearly twenty years since I condemned the useless extension of leading growths in the Journal, and I have never since had occasion to change the opinion then expressed.—R. INGLIS.

UNTRANSPLANTED CELERY.

A FEW gardeners advocate the transplanting of Celery direct from the seed pan to the trenches, but so far as I know none has advocated the plan of sowing the seed where it is to remain. There seems to be no reason why that practice should not be followed. I grow 450 plants, all sown indoors and pricked out in boxes before being transferred to the trenches, and amongst them I have not a dozen better plants than one which has sprung from seed accidentally sown with the Onions on March 24th. The soil is very heavy, nearly approaching clay, and at the winter digging it received a moderate dressing of stable manure. When dry in spring it was thoroughly pulverised, and afterwards rolled say half a dozen times with a heavy iron roller. The drills were then drawn rather deep and partly filled with a mixture of old potting soil, soot, and wood ashes. On this the seed was sown and the drills filled up with the same material; the roller was again passed over the ground twice or three times. Since then beyond hoeing to keep down weeds nothing has been done to help on the Celery plant; it is now 24 inches high and proportionately strong.

In some gardens, I believe, it is now the custom to plant late Celery on the level ground, and there appears to be only one objection to sowing the seed at suitable distances and thinning out much in the same way as Turnips and Lettuces are treated, and that is the liability to destruction by slugs when the plants are small. It ought, however, to be no more difficult to keep these marauders from Celery than from other things of which they are equally fond. The advantages of the plan are many, not the least being a saving of valuable space under glass in spring when every available house and frame is generally overcrowded. So treated, too, the plants will be less liable to checks, and consequently the risks of bolting will be considerably reduced, and much time spent in watering may be saved. I may say that the plant has not had any advantages in the way of a warm situation, as the garden is situated on a hill in a district notoriously cold, and at the north side has no protection, not even a hedge, being separated from the grass fields only by an iron fence.

While on the subject of Celery I should like to say a few words in praise of Incomparable Dwarf White. For early use it is invaluable, being more easily blanched than any other variety that I know, and if thickly planted will partly blanch itself. In a trench or sunken bed 20 feet by 2 feet 6 inches I have 120 plants, and on earthing up yesterday we found that the heart of each plant was already blanched, and in a fortnight will be quite ready for use. Last year we had it well blanched fourteen days after earthing.—NORTH YORKS.

WHICH ARE THE BEST STRAWBERRIES?

CIRCUMSTANCES must guide the cultivator in a selection of kinds. What suit some soils will not succeed in others. Then, again, there is the question of palate; this varies also. The soil here is not good for Strawberries, too much chalk being mixed with it. Strawberries do not like chalk; the roots do not last so long in it, the foliage generally assumes a pale colour, and the finest fruit, as a rule, does not come from such plants. The most useful of all is Vicomtesse Héricart de Thury; it is an enormous cropper. The fruit is, perhaps, rather small, but the flavour is excellent, and that is of more consequence than mere size. This variety, taking one year with another, is not very much behind Noble in earliness. The foliage protects the early blossoms from late frosts, owing to its somewhat dense character. Again, I find the roots of this sort less injured by severe frost than any other; while perhaps a dozen roots were killed in one row of other sorts, not a gap was to be seen in rows of the Vicomtesse growing alongside.

Sir J. Paxton is the great sheet anchor of the market people in this neighbourhood. Although not of a very high flavour, it is a good grower, a free bearer, and the fruit travels well, which is a decided point in its favour, the flesh being firm. I have tried Dr. Hogg and British Queen, and in our soil must give the preference to the former, it being hardier and more free in its cropping. The flavour is of the best. President is the next sure kind I recommend, not having had experience enough with Waterloo to speak with confidence. President is free in fruit production, the berries reach to a good size, and are of fair flavour, there being just a taste of acidity in them from this soil.

Sir J. Paxton has such a habit of continuance that it is really the latest sort as well as sometimes being the earliest. This question of earliest is largely dependent on the weather. The four sorts mentioned will be found quite first-rate where quantity is required consistent with quality.—E. M., Swanmore.

GUSTAVE GRUNERWALD.

A PHOTOGRAPH and bloom of a very promising new early Chrysanthemum named Gustave Grunerwald have been sent to us by Mr. W. Piercy, 89, Beadnell Road, Forest Hill, London, S.E., and fig. 21, which was prepared from the photograph, represents it. It is a Japanese variety, with tubular florets, the central ones curled inwards. The plant shown was grown in a 32-size pot from five cuttings, put in the 5th of April, 1892, and was photographed on August 5th. It was then 19 inches high from the soil in the pot. The open flowers were 4 inches across, of a pale magenta or rosy lilac to white colour. It was grown and flowered entirely in the open air, had only two small pegs to support it, and had no buds taken off. As an early bloomer it is one of the most remarkable yet introduced. It was raised by Mons. Délaux of Toulouse, France.

DWARF CHRYSANTHEMUMS.

AT Kineton House, the residence of Lord Willoughby De Broke, Mr. Hall has this year grown a capital batch of Chrysanthemums, which are much dwarfer than those generally met with. Plants of Etoile de Lyon in 7 and 8-inch pots were in some cases not more than 1 foot or 15 inches above the rim of the pots,

FIG. 21.—NEW EARLY CHRYSANTHEMUM GUSTAVE GRUNERWALD.

and as far as I could judge no plant in the collection was more than 3 feet in height, although such tall varieties as Carew Underwood were grown. There may be two opinions as to whether it is desirable to grow Chrysanthemums with only three shoots quite so dwarf as this. Assuming that it is, there would be no difficulty in doing it either by striking the cuttings late, by topping, or cutting down the plants. Mr. Hall, however, assured me the cuttings were put in during November, and had neither been topped nor cut down.

The yellow Marguerite, Etoile d'Or, was also in capital condition at Kineton House, being quite free from maggot, and growing much more freely than this variety generally does. Mr. Hall finds that to keep it in good health it must be well fed, there is then no fear of the maggot.—H. DUNKIN.

EVENTS OF THE WEEK.—The ensuing week will be a somewhat busy one. To-day (Thursday, August 18th) Shrewsbury and Cardiff Shows are continued, while Aberdeen opens, the latter being continued on the 19th and 20th. On Saturday, the 20th, the National Co-operative Show takes place at the Crystal Palace. On the 23rd and 24th the Royal Horticultural Society will hold an Exhibition and Conference on Begonias, Ferns, Apricots, and Plums at Chiswick. The Exhibition of the Royal Horticultural Society of Ireland takes place on the 24th. On the 24th, 25th, and 26th the Great Show at Newcastle-on-Tyne is held, and on the 25th there will be Exhibitions at Droitwich and Kenilworth. A sale of Orchids will be conducted at Messrs. Protheroe & Morris' Rooms on Friday, August 19th, and of bulbs on the 22nd.

— **THE WEATHER IN LONDON.**—Warm, bright, and genial weather has prevailed during the past few days, and the rainfall has been very slight. Rain fell for an hour or two on the morning of the 16th, but the latter part of the day was brilliantly fine. At the time of going to press the barometer is falling and the wind is very variable, so that rain may be expected.

— **POTATO DISEASE.**—The Potato disease made an early appearance in this part of Suffolk, being plainly visible in the garden allotments by the third week in July, and in spite of the dry weather the tubers are already considerably affected. It is almost the universal practice about here for cottage gardeners and allotment holders simply to leave the diseased tubers to rot on the land where they are taken up, and in many cases to grow Potatoes again on the same plot next year. I do hope the Instructors in horticulture appointed under the Technical Instruction Committee of the County Council will point out that common sense ought to show, as clearly as scientific knowledge, that such a system affords every possible encouragement to a renewal of the disease.—W. R. RAILLEN.

— **PEA SHROPSHIRE HERO.**—Having tried several of the newer varieties of Peas this season I have no hesitation in placing the above, raised by Mr. Eckford, amongst the finest Peas I have seen. It produces fine pods abundantly, and is of excellent flavour; it is also robust in habit, and has not grown higher than 3 feet. It is in my opinion a Pea to be remembered for another season.—R. P. R.

— **DISQUALIFIED COLLECTION OF FRUIT AT TRENTHAM SHOW.**—Like "W. H. M." I fail to see upon what basis the Judges grounded their decision when they disqualified Mr. McIndoe's collection of fruit because it contained two varieties of Pines. The terms of the schedule, as quoted by your representative and by Mr. McIndoe, clearly state that nine dishes are required to complete the exhibit, of these four kinds are specified to be included, and presumably the other five dishes may consist of any varieties of fruit the exhibitor chooses to stage. I venture to say this is the interpretation ninety-nine out of every 100 exhibitors would place upon the words of the schedule. In the absence of any stipulation or rule to the contrary the Judges could not have any right to deprive Mr. McIndoe of the prize he was justly entitled to.—W. H. D.

— **EXHIBITION POTATOES.**—I have found it needful on more than one occasion to invite exhibitors where there are classes for two or more dishes of round or kidney Potatoes at shows to set up varieties that are distinct in colour if possible, so that there may be no question as to distinctness of sort. We have such good varieties of coloured rounds as Reading Russet, Vicar of Leham, The Dean, Conference, and General Gordon, so that there is no reason to set up all whites and much alike. When two sorts are invited, even in the case of both being kidneys, there are Ruby, Prizetaker, Edgcote Purple, Bedford Purple, Beauty of Hebron, and others available, so that there is no excuse for putting up only white sorts. Perhaps the most popular white round is Sutton's Satisfaction, for it turns up everywhere, but it also in some soils assumes a long or kidney form, and thus it is sometimes found in both round and kidney classes. Any variety ordinarily exhibited in one section should never be accepted in the other, as it cannot be both round and kidney.—A. D.

— **WEIGHT OF CURRANT CROP.**—Mr. F. A. Bowman informs us that he has gathered 27 lbs. of the Red Grape Currant from one bush, and 20 lbs. from another, or 50 lbs. from two bushes. Our correspondent would be "glad to know the heaviest weights of Red and Black Currants from a bush or tree."

— **MR. A. H. JOHNSON**, for many years manager for Messrs. Armitage Bros., seed merchants, Nottingham, has joined the old-established firm of Messrs. Fletcher, Son & Co., Chesterfield, in partnership, and the name and style of the firm in future will be Fletcher, Douglas, and Johnson.

— **EARLY HOPS.**—The first pocket of this year's Worcester Hops passed the public scales on Friday, the 12th inst. They were grown by Mr. H. T. Taylor, of Showle Court, Ledbury, and purchased by Messrs. Edward Webb & Sons, Hop and Seed Merchants, Wordsley, Stourbridge, who sold them to Mr. Benjamin Elwell of the Delph Brewery, Brierley Hill, at £10 per cwt.

— **A PLEASANT DAY'S OUTING.**—Messrs. J. Laing & Sons, accompanied by some eighty of their employes, spent a pleasant day in Folkestone on Friday last. The senior partner presided over a substantial dinner, when the toast of his health and the prosperity of the firm was enthusiastically received by the staff. Special carriages were engaged for the journey.

— **HYBRID VALLOTAS.**—Mr. A. J. A. Bruce, Chorlton-cum-Hardy, Manchester, sends us blooms of some hybrid Vallotas, marking many variations in colour from V. purpurea. No. 2 is blush, No. 3 rose, No. 4 deep salmon, No. 5 light scarlet, No. 6 deep scarlet, and No. 7 bright scarlet. They are very brilliant in colour, and may be looked upon as very desirable acquisitions. The old Scarborough Lily is so useful a plant that distinct forms such as these are well worth having.

— **THE WEATHER DURING JULY AT RIPLEY, YORKS.**—The weather was mostly dull with cool nights, but was fairly dry. On several occasions the thermometer fell as low as 35°. On twenty-two days the wind blew from northerly and easterly directions. The total rainfall was 1.53 inch, which fell upon nine days, the greatest daily fall being 0.80 of an inch. Mean reading of barometer, 30.07; mean maximum temperature, 66°; mean minimum temperature, 40.8°; mean temperature 53.4°. Highest maximum temperature, 77° on the 3rd; lowest minimum temperature, 32° on the 18th.—J. TUNNINGTON, *Ripley Castle Gardens*.

— **EXHIBITION AND CONFERENCE ON BEGONIAS, BRITISH FERNS, APRICOTS, AND PLUMS.**—On Tuesday and Wednesday next, August 23rd and 24th, the historic gardens of the Royal Horticultural Society at Chiswick will be enlivened by an Exhibition of Begonias, Apricots, and Plums, in addition to which growers of British Ferns will contribute specimens of our native Cryptogams, by way of showing what beautiful forms and varieties may be obtained by patient cultivation and careful hybridisation. All the Committees will meet in the Gardens at 11 A.M. precisely on Tuesday, August 23rd, and there is no doubt but that two of them—viz., the Floral and Fruit—will have a busy time of it, while exhibitors of Orchids will receive the attention of the Orchid Committee at the same time. Every amateur grower of Begonias, Apricots, Plums, and British Ferns should endeavour to take part in this Exhibition, and should at once, if it has not already been done, communicate the nature of his exhibit to the Garden Superintendent, so that due provision for space may be made in good time. In accordance with the policy inaugurated a few years ago, the Society will hold a Conference in the great vinery on each of the above-mentioned days at 2 P.M. The subject of the first day's Conference will be "Begonias." Mr. Harry J. Veitch, F.L.S., has consented to take the chair and open the Conference, after which papers will be read by Messrs. W. Watson, J. Laing, and H. Cannell on the "Cultivated Species of Begonia," "Tuberous Begonias," and "Winter-flowering Tuberous Begonias" respectively. On the second day (August 24th) the Conference on Apricots and Plums will be presided over by Dr. Robert Hogg, F.L.S., and Messrs. T. Francis Rivers and J. Smith will read papers on "Dessert Plums" and "Cooking and Market Plums" respectively, while Mons. F. Jamain, of Paris, will contribute a paper on "Apricots." Besides the Exhibition of flowers and fruit which will be brought together on this occasion, it may be stated that the gardens themselves look extremely beautiful at present, and will well repay a visit—not only from gardeners, but also from ladies and gentlemen interested in the promotion of horticulture.

— **MONARDA DIDYMA.**—This hardy plant is at Rede Hall truly beautiful. It grows in big clumps about the borders, flowering profusely, and giving large masses of bloom of a rich crimson scarlet hue. This is an indispensable adjunct to hardy plant borders, and seems to like stiff soil. It is sometimes known as the Oswego Tea plant.—A. D.

— **CHILDREN POISONED BY LABURNUM SEEDS.**—We have more than once pointed out the danger of Laburnum seeds to children and animals. It is reported that while a number of pauper children were proceeding from school to the Sunderland workhouse they commenced to pick seeds from Laburnum trees, and a quantity were eaten. Several children became ill, four of the girls being in a state of complete collapse, and twenty others had to undergo medical treatment. We believe the whole of them are recovering.

— **A LAY SERMON ON FLOWERS.**—A morning paper notes a somewhat new departure at Ipswich. Dr. Taylor, the well-known editor of "Hardwicke's Science Gossip," a layman, preached a sermon in one of the churches. It is true he did not venture into the pulpit, but he put on a surplice and discoursed on flowers. To the average man it must appear a very sensible arrangement to choose for the preacher of what is known as a flower sermon one who is remarkably well acquainted with the subject he is dealing with.

— **FINE CANON HALL MUSCAT GRAPES.**—Grand examples of this most excellent Grape may be seen at Shipley Hall, Derbyshire. Since these unique gardens have been under the management of Mr. Elphinstone the public has been treated to many examples of high-class Grape culture, and I am glad to learn that Mr. Elphinstone intends sending some of the above rare specimens to the forthcoming International Fruit Show, to be held at Earl's Court on the 26th and 27th inst., where they will not improbably be one of the chief attractions.—J. L.

— **DENBY FLOWER SHOW.**—The annual Exhibition of the Denby Floral and Horticultural Society was held on the Cricket Ground, Denby, on Saturday. The day was fine, and the attendance of visitors large. The exhibits were divided into two principal classes—viz., those residing within the parish, and those who were practical gardeners residing within four miles of Denby. There was also a farmers' class, and one for Day and Sunday School children. The special prize list included industrial work, which is a feature peculiar to this Show. Although we cannot find space for particulars, we are pleased to record the success of the Show.

— **OLEARIA HAASTI.**—Introduced by Messrs. Veitch of Exeter in 1858, this hardy New Zealand shrub deserves to be kept under notice. It forms bushy specimens; the leaves are deep dark green and shiny, each about three-quarters of an inch long. Though at first sight it would not appear so, this shrub belongs to the large natural order Compositæ, sub-order Asteroideæ. The flower heads are numerous and corymbose, the heads have two to five ray flowers, the ligules being a quarter of an inch long, and white. *O. Haasti* is found in the province of Canterbury, N.Z., growing at an elevation of 4000 to 5000 feet, and varies slightly in habit according to the situation it grows in, being dwarfer and darker in colder than in sheltered positions.—C. K.

— **THE GREAT FRUIT SHOW AT EARL'S COURT.**—There is every promise of a very fine show of fruit at Earl's Court on August 26th and 27th. Intending exhibitors who have not sent in their entries should do so at once. The prizes are excellent. In the first of the forty-six classes prizes of £12, £9, £6, and £4 are offered for a collection of fruit not less than twenty dishes. In this collection four varieties of Grapes (two white, two black—two bunches of each variety), two Pines, two Melons, two dishes of Peaches, two of Nectarines, and two of Plums are required; the remainder to be distinct. In the second, £8, £6, £4, and £3 are offered for twelve dishes, and prizes of equal value are offered for ten varieties of Grapes, two bunches of each. There are eleven classes for Grapes altogether, two for Pine Apples, two for Figs, six for Peaches and Nectarines (grown and ripened out of doors), five for Plums, nine for Apples (the first five for outdoor fruit), four for Pears (two for outdoor fruit), and four for Tomatoes. In connection with the Show a social gathering of the gardeners of the United Kingdom will be held on the afternoon of the 26th, followed by a dinner in the exhibition building, which, with liquid refreshments included, will be provided at 4s. a head. As only a limited number can be accommodated, the tickets will be issued according to priority of application. Dinner at 5 P.M.

— **BECKENHAM FLOWER SHOW.**—Favoured with genial sunshine and the most temperate of breezes, the annual Show of the Beckenham gardeners and amateur horticulturists was recently held in the Croydon Recreation Ground. The extensive ground in which the Show marquees were placed enhanced to a great degree the *éclat* of the day, and the musical attractions went far to make the affair a highly enjoyable garden party and fête. The judging was finished about two o'clock, at which hour the hon. member for the Sevenoaks Division declared the Show open. The exhibits were disposed in three commodious marquees.

— **CHILHAM FLOWER SHOW.**—The fourteenth annual Show of the Chilham Gardeners' Society was held in Chilham Castle grounds, kindly lent by C. S. Hardy, Esq., on Thursday week in beautiful weather. There was a large number present, and the band of the 3rd and 4th battalions of the Buffs was in attendance. The show of fruit, flowers, and vegetables was an excellent one throughout. A large number of Palms, Ferns, Cockscombs, Begonias, Caladiums, Pandanus, and several other foliage plants were sent by Mr. W. Douglas, gardener to C. S. Hardy, Esq., and these occupied half of one side. Mr. P. H. Pierce, of St. Dunstan's, Canterbury, also sent a good number of plants.

— **LEIGH FLOWER SHOW.**—The annual Flower Show held at Leigh, near Uttoxeter, took place on Thursday, and was well attended by visitors. The exhibits showed considerable improvement upon previous years, and there was an excellent competition for the special awards for butter. The prizes were distributed on the lawn in front of Leigh Rectory, the residence of the Ven. Archdeacon of Stoke, by Mrs. Morton Philips. At the same time Mr. J. W. Philips, on behalf of the parishioners, presented Mr. Marlowe, late station master at Leigh, with a cheque for twenty guineas. Very opportunely, a lecture was given by Mr. Robert Cock, the County Council Instructor, in cottage gardening.

— **THE WEATHER LAST MONTH.**—July was very changeable and showery up to the 20th but finer afterwards. We had only seven bright days, one of which was partly clear. The wind was in a northerly direction nineteen days. The temperature varied very much, and we had gales on the 7th and 19th. The barometer was highest on the 24th at 9 A.M. = 30.40, lowest 29.50 at 10 P.M. on the 19th. Total rainfall 2.30 ins., which fell on twelve days, the greatest daily fall being 0.87 inch on the 16th. Highest shade temperature 84° on the 3rd, lowest 42° on the 1st, 18th, 19th, and 21st; lowest on grass 40° on the 1st, 19th, and 21st. Mean of daily maximum 66.29°, mean of daily minimum 48.87°, mean temperature of the month 57.38°. The garden spring ran 20 gallons per minute on the 31st.—W. H. DIVERS, *Ketton Hall Gardens, Stamford.*

— **SHARPE'S QUEEN PEA.**—This very fine, straight green-podded Pea bids fair to oust the Duke of Albany from its high place as the leading show Pea. I do not think that any judge at a flower show on comparing the two varieties would hesitate for one moment in making an award in favour of the former if the samples were good. The pods of the Queen are flattish, never puffed or hollow, they open very freely and are found to contain ten or eleven good sized, very green peas, sweet and of good flavour. Very large peas are as objectionable as are puffy pods. I have seen several dishes of this new Pea during the season, and find no difficulty in giving to it the highest awards. I was pleased to see that the best of the very fine Peas which Messrs. Sutton and Sons sent to the Drill Hall last week, New Marrowfat and Perfection, were of the Queen type, and in that respect should make first-rate market as well as exhibition sorts.—A. D.

— **FLORAL FETE AT CREWE.**—Mrs. Cotton-Jodrell, wife of Colonel Cotton-Jodrell, M.P., opened the annual floral fête and musical festival in the Borough Recreation Grounds, Crewe, on Saturday. The weather was fine, and there was an enormous attendance from all parts of Cheshire. The exhibition was one of the best ever held, and Mrs. Cotton-Jodrell, who was accompanied by a party of friends, warmly praised the collections. Lord Crewe sent a magnificent lot of plants not for competition. Among the leading prizetakers in the gentlemen's classes were the Duke of Sutherland, Mr. Bromley-Davenport, M.P., Mrs. Bennett (Shrewbridge Hall), Mr. W. H. Verdin (Darnhall Hall), Mr. Worthington, and others. A special feature of the Show was the exhibition of plants grown in the cabins of signalmen up and down the L. and N.W. Railway. Some of these were magnificent specimens, and covered with flowers. The show was the most successful yet held. During the afternoon the Blue Hungarian Band gave selections of music.

— *CATALPA BIGNONIOIDES*.—One cannot help noticing that this fine deciduous tree is being planted largely for effect in large borders and as specimens on lawns. The tree naturally assumes a good shape and attracts notice by means of its large heart-shaped leaves, but those who have not seen a good specimen in full flower at this time of the year have missed a fine sight. A large tree near the succulent house at Kew is flowering finely, and I noticed a good specimen the other day in full flower overhanging the main road near Staines Bridge. The flowers are white, speckled with purple, and streaked with yellow, borne on terminal branching panicles. *C. bignonioides* was introduced in 1726, and is a native of the banks of the Ohio and Mississippi, where it grows to a height of 40 feet.—C. K.

— SIXTY TONS OF GRAPES FROM HAMPTON COURT. — Under this sensational heading a daily contemporary says:—"There will be 1500 bunches of Grapes to cut from the great Vine at Hampton Court this year. The Vine is precisely the same age as the Royal Academy, 124 years, and while modern art as typified by this institution has grown and flourished, the Vine has been bearing more and more until by the end of the present century—if no mishap occurs—it will have borne nearly 200,000 bunches, or at least 60 tons during its career. Only a few bunches are in condition at present, but before the end of the month supplies will be sent daily for the use of Her Majesty, who with the assistance of the Royal household uses the greater proportion of the total yield. On one or two occasions, however, the Queen has commanded that supplies should be sent to one or two hospitals, strictly for the use of the patients."

— WYCHBOLD FLOWER SHOW.—A horticultural Show was held in the grounds of Wychbold Hall on Saturday afternoon in connection with the village Club. The exhibits were of excellent quality, and included honorary displays by Mr. Parker, gardener to John Corbett, Esq., of Impney, and Mr. R. Holmden Amphlett of Wychbold Hall. The following were the principal prizewinners:—Messrs. J. Jones, G. Honeybourne, W. Workman, J. Smith, T. Smith, F. Wattis, J. Farmer, T. Sproston, C. Cuff, W. Smith, J. Wattis, C. Stevens, J. Goddard, W. Pinches, and Mrs. Workman. The following prizes were awarded for the neatest and best cultivated allotments and cottage gardens:—Sir H. F. Vernon's allotments—1, C. Stevens; 2, W. Smith; 3, H. Smith. Mr. R. H. Amphlett's allotments—1, C. Stevens; 2, T. Sproston; 3, W. Bennett. Wychbold Cottage Gardens—1, G. Honeybourne; 2, J. Farmer; 3, S. Sproston. Mrs. Amphlett gave away the prizes in the evening.

— RIPENESS IN MELONS.—A great deal more attention might well be bestowed on the indications of ripeness in Melons than appears now to be given, judging by the condition of much of the fruit that is exhibited. So much of it is either under or over-ripe that the questions arise, Are gardeners unable to estimate the ripeness of Melons, or are they counting on similar ignorance on the part of the judges? At a recent Show three fruits were tasted, two of which were over-ripe, one so much so as to be, in my opinion, positively dangerous to eat. A portion of the mouthful taken slipped down my throat unexpectedly; it was fortunate that the greater part did not follow it, but was promptly expelled, for the after effects were not pleasant. To have partaken freely of fruit in such a condition would probably have led to evil results, and it cannot be urged too strongly upon gardeners that the utmost care should be taken in sending fruit to table at this period of the year.—E. H. M.

— FEATURES OF MOROCCO.—In one of his despatches Sir C. Euan-Smith gives the following interesting particulars of the features of the country through which the mission passed:—"The country which we passed through was, without exception, beautiful and fertile; it exhibited a great want of population, towns, and villages, though the plains in every direction were dotted here and there with tents and huts containing ten or twelve human beings. The main characteristics of the country were the entire absence of trees and the great quantity of water; in every direction, and at short intervening distances, we met with streams of considerable size. We marched for days together over vast plains, surrounded on every side by hilly ranges, and covered as far as the eye could see in every direction with fields of waving and rapidly ripening grain. No one contemplating the immense area of land under cultivation could entertain any doubt as to the possibility of Morocco becoming the granary of Europe. I am informed, indeed, that in many districts the harvest of this year has been so universally plentiful that labour is altogether wanting to gather it in, and that much of the grain will have to remain rotting in the ground.

— *LITHOSPERMUM PROSTRATUM*.—Like "*D., Deal*," page 97, I had for a couple of years some difficulty in establishing this Alpine shrub in a satisfactory manner, but I have now overcome all obstacles, and am yearly rewarded with a lovely patch of brilliant blue flowers almost rivalling the Gentians close by. Our clump is growing on the bottom ledge of a rockery about 1 foot high; the roots run between this and a high upright stone at the back of the clump, which is favourable to moisture. I find this plant requires abundance, indeed during a spell of hot dry weather our plant receives copious supplies every week; were it not so the leaves and young shoots would soon exhibit a drooping appearance. The position is quite open to the midday sun, but cooler in the morning and evening. Peat only is what the plant is growing in. Being rather straggly I layered all the branches, using rough lumps of peat only, the result being a compact mass of short growths which are annually smothered with the charming blue flowers so much appreciated. To two things I attribute my success—the use of peat only for the roots to ramble in, and abundance of moisture at the roots.—E. M.

— ROYAL BOTANIC SOCIETY OF LONDON. — The fifty-third anniversary meeting of this Society was held on the 11th inst., Mr. George W. Bell in the chair. In presenting the reports of the Council and Auditors for 1892, the Chairman congratulated the Fellows upon the very satisfactory condition of the Society as compared with last year, both from a financial point of view and as a Society whose objects are the study of botany and horticulture, and the advancement of the arts and pursuits connected with it. The receipts show an increase of more than £300 over those of last year, a particularly gratifying result when the very unfavourable season is taken into consideration. The gloom that fell upon society in London at the beginning of the year in the peculiarly sad death of the Duke of Clarence was doubly felt by the Society, whose connection with the Royal Family has been both long and close. The various exhibitions and fêtes were successfully carried out and large attendances recorded, while the quality of the exhibits shown has been in every case above the average, and bears witness in a striking manner to the advance in the art and science of horticulture as evinced in the last few years. Among the more purely scientific work of the Society may be mentioned the botanical lectures given by eminent scientific men to all visitors to the Gardens during the summer months; also the facilities offered to students and others engaged in the study of botany or medicine, to whom nearly 700 free orders of admission have been granted for from one to three months each, as well as many thousands of illustrative plant specimens. The meeting closed with a unanimous vote of thanks to the Chairman and executive officers. The Duke of Teck was re-elected President and Mr. H. L. Antrobus Treasurer. Among the donations on the table were some fine Apples from Mr. S. W. Silver's estate in New Zealand.

— EASTWELL PARK.—A sale has been arranged by Messrs. J. A. Lumley & Co., of 35, St. James's Street, on behalf of the Earl of Winchilsea and Nottingham, of the celebrated Eastwell Park Estate, in the county of Kent. The purchaser is Lord Gerard of Garswood, Newton-le-Willows, Lancashire, and the price given is close upon a quarter of a million pounds. Eastwell Park was for many years the residence of the Duke of Edinburgh, and previously was occupied by the Duke of Abercorn. The estate comprises 6000 acres, and the park is one of the largest in the kingdom, exhibiting in its vast extent of surface every variety of scenery. Its noble avenues and forest-like masses of magnificent timber, tenanted by herds of deer, have a very imposing appearance. Eastwell, at the time of the Domesday, formed part of the possessions of Hugo de Montfort, who accompanied the Conqueror from Normandy. His grandson Robert, favouring the title of Carthorse, in opposition to Henry I., rather than be called in question for it, voluntarily exiled himself and gave up his possessions to the Crown. It afterwards came into possession of the eminent family of Carrol, from which it passed to Thomas de Poynings, and from this name by a female heir in the reign of Edward VI. to the Earls of Northumberland. In the reign of Henry VIII. it was purchased by Sir Christopher Hales, whose three daughters sold it to Sir Thomas Moyle, who rebuilt the mansion and died in 1560. His daughter Catharine carried it as a marriage settlement to Thomas Finch, afterwards Sir Thomas Finch. To Sir Thomas succeeded his son Sir Moyle Finch, whose widow, Lady Elizabeth, was in 1623 created Viscountess Maidstone, and in 1628 Countess of Winchilsea. She died in 1633. The present Earl of Winchilsea and Nottingham is a descendant of this illustrious lady. There is a tradition that Richard Plantagenet, a natural son of Richard III., after the battle of Bosworth, fled to Eastwell, and lived there in

obscurity till his death in 1550. There is an entry of his burial in the present registry. The house in which he lived and died he built by leave of Sir Thomas Moyle in a field near Eastwell Place. It was pulled down by Heneage, Earl of Winchilsea, who died in 1689. In the chancel of Eastwell Church is a fine monument to the Earls of Winchilsea.

AGLAONEMA COSTATUM.

AMONGST the plants introduced to public notice for the first time during the present season, a very prominent place must be given to the beautiful Aroid, *Aglaonema costatum*, exhibited by Messrs. J. Veitch & Sons at a meeting of the Royal Horticultural Society on May 3rd, and represented by fig. 22. It is a dwarf foliage plant of great distinctness and beauty, introduced by the exhibitors from the

resides on the outskirts of the town. Prior to the Show a call was made at Ashgrove, the seat of R. K. Hodgson, Esq., whose gardens and estate are managed by Mr. Charles Dunning, a gardener of sound judgment and admitted ability. The chief features of the pleasure grounds are splendid Beeches with towering Silver Firs rising high above them, and such imposing masses of Rhododendrons as are rarely met with. These, with the hardy Azaleas, which grow like Willows, must produce a glorious effect in May, and it is then we shall hope to see them. At present the Show, which was held in Knole Park, demands attention. Knole Park is the seat of the Earl of Sackville, and may be fairly described as one of the most beautiful parks in the kingdom. The mansion, too, is a stately pile, and is said to cover with its appurtenances five acres of ground. The pleasure grounds, of several acres, are surrounded by a wall, massive and apparently ancient, but were kindly opened to visitors to the Show. Broad glades of velvety lawn with stately trees and old-fashioned flowers render this a typical old English garden, and very delightful. A tree of note is a proliferous Lime. The

FIG. 22.—AGLAONEMA COSTATUM.

Perak region, and put into commerce for the first time last spring. The leaves are about 4 inches long and $2\frac{1}{2}$ to 3 inches broad. The spreading, broadly ovate blade, is dark glossy green and thickly sprinkled with creamy white spots, the midrib being of the same colour as the latter. The plant is of dwarf habit, attaining a height of 4 to 5 inches, and this, combined with its attractively marked foliage, renders it extremely useful; moreover, it is very effective in artificial light. It requires a stove temperature, but is of easy culture, little subject to insect attacks, and the old foliage retains its freshness for a long period. A first-class certificate was awarded to it when exhibited at Westminster, and the distinction was well deserved.

HORTICULTURAL SHOWS.

SEVENOAKS.—AUGUST 10TH.

SEVENOAKS is a clean, pleasant, salubrious, and apparently thrifty Kentish town, nestling in a fertile vale with beautiful surroundings of tree-clad hills and picturesque vistas. There are several noblemen's and gentlemen's seats in the district, and the genial Mr. Harrison Weir

branches of the original tree have reached the ground, rooted, and from these several trees have grown, about as large as the "mother." Then at a farther radius are others, smaller, forming quite a grove. The grounds are in admirable order, and have been greatly improved of late by Lord Sackville's gardener, Mr. E. Stubbs. Some historical particulars about Knole are too tempting to be passed. They were published with a prize list of the Show, in the form of a special edition of the *Sevenoaks Chronicle*, an hour or two after the judging was completed—smart work, which we are glad to recognise. After describing Knole as the glory of Sevenoaks, our contemporary goes on to say:—

"The origin of Knole House is lost in the obscurity of the past. The first trace discoverable in history is in the time of King John, when it was possessed by Baldwin de Bethun. Through the Mareschals, Earls of Pembroke, and the Bigods, Earls of Norfolk, it passed to Otho de Grandison, in whose possession it was in the time of Edward I. and in whose family it continued until the reign of Richard II., when it was conveyed by Thomas Grandison to Geoffrey de Say. In the reign of Henry VI. it was sold to James Fiennes. By his son, Sir William, it was sold to Thomas Bouchier, Archbishop of Canterbury, the fourth Archbishop before Cranmer. Bouchier restored and enlarged the buildings, as also did his successor, Cardinal Morton, who made it his chief residence. King Henry VII. was sometimes his guest. Morton died at Knole in 1500,

Henry Dene, the next Archbishop, chiefly resided at Otford Palace, which he in part rebuilt. Warham, the late Archbishop, before the Reformation, lived much at Knole, where he was often visited by both Henry VII. and Henry VIII. He died at Otford in 1532. Knole was given up by Cranmer to Henry VIII. by way of exchange. On his attainder it passed into the hands of Queen Mary, who gave it to Cardinal Pole. At his death it reverted to the Crown. Elizabeth gave it to Sir Robert Dudley, afterwards Earl of Leicester, who surrendered it in the eighth year of her reign. She then gave it to Thomas Sackville, afterwards Earl of Dorset. This Sackville was related to the Queen by intermarriage of his family with the Bollyns. He was reckoned the first poet of his day, and obtained equal eminence as a statesman. He entered Parliament in the reign of Queen Mary, and was employed by Elizabeth in many important offices. King James often visited him at Knole, where he had a bedroom for his sole use, the furniture of which cost £20,000. The bedstead, adorned with gold and silver tissue, lined with richly embroidered satin, alone cost £8000. Charles, the sixth Earl of Dorset, like the first, was also a poet and statesman. It is said that Dryden often visited him at Knole. There is a story told that once after dinner, when the wit of the company was flagging and even the wine did not loosen their tongues, it was proposed to try which could write the best impromptu. Dryden was to be judge. When the papers were read the poet said that there could be no doubt that the Earl's was the best. He had written, "I promise to pay Mr. John Dryden, on demand, the sum of £500." The great beauty of Knole is that it is almost unchanged in style, decoration, or furniture from the time of James I. It is a quadrangular house, principally of Elizabethan architecture, though the influence of the old ecclesiastical possessors is evident in the square-headed windows. The park is five miles round and skirts the Tonbridge road for a considerable distance. It abounds in fine woodland and forest scenery. Among the trees the King's Beech is nearly 28 feet in circumference, and displays as much top as three or four ordinary trees."

At last we came to the Show, not with the intention of giving anything approaching a detailed report, but rather for indicating its character, and noting the products of some of the chief prizetakers. It may be said at the outset that the Show was both extensive and excellent. Five marquees were filled, that devoted to plants, large as it was, being distinctly overcrowded. Specimen plants, groups of plants and Ferns, also vegetables, merit words of high commendation, and there was a good display of fruit.

Turning to the classes, we note that for six flowering plants in that number of varieties, Mr. A. Gibson, gardener to J. F. Burnaby-Atkins, Esq., Halstead Place, was first. He showed two *Dipladenias*, *amabilis* and *Brearleyana*, noble specimens in superb condition; fine examples of *Clerodendron Balfourianum* and *Anthurium Schertzerianum*, with a good *Allamanda* and *Ixora*. Mr. J. T. Goodman, gardener to Mrs. Crawshaw, Bradbourne Hall, was a good second with highly creditable specimens of *Anthurium Andreanum*, a *Stephanotis*, *Allamanda*, and *Clerodendron* being noteworthy. Mr. A. Hatton was third with smaller yet healthy plants. The single specimen class brought out some fine examples of culture. Mr. Gibson was first with *Dipladenia Brearleyana* on an oval trellis 4 to 5 feet high, covered with beautiful blooms (silver medal). Mr. C. Sutton, gardener to Earl Stanhope, Chevening Park, was an excellent second with *Dipladenia amabilis* in superb condition, and Mr. H. Elliott, gardener to Lord Hillingdon, The Wilderness, Seal, third with a wonderful mass of *Lilium auratum* increased from one bulb, presenting 300 flowers and buds. Mr. Goodman had the best specimen foliage plant, *Anthurium Veitchei*, with six handsome leaves; also the best six foliage plants, and good they were, comprising *Alocasia Thibautiana*, *Cycas revoluta*, *Crotons Williamsi* and *majesticus*, and a *Kentia* and *Latania*. Mr. Hatton second. The two last-named exhibitors were placed in the same relative positions with well grown *Fuchsias*, and Mr. Elliott exhibited fine plants not for competition. *Caladiums* were excellently shown, Mr. Hatton being first, Mr. J. Talmage, gardener to Miss Hodgson, Hernewood, a close second, and Mr. W. Handcock, gardener to Lord Dunsany, Dunstall Priory, Shoreham, third. *Begonias* made a bright display, the first prize collection of six from Mr. E. Hayes, gardener to J. Dixon, Esq., Edenhurst, containing an excellent plant of *B. Dregei*, 2 to 3 feet across. Some other classes are passed to notice the very fine Ferns of Messrs. Goodman, Hatton, and J. Bolton, gardener to Lord Amherst, Montreal, who were placed in the order named in the class for six plants. The first prize specimens comprised a grand example of *Microlepia hirta cristata*, *Davallia Mooreana* 7 to 8 feet in diameter, *Dicksonias squamosa* and *antarctica*, *Cibotium regale*, and a *Goniophlebium*.

Groups of plants arranged for effect were numerous and excellent, and the Judges could not have had an easy task in determining their relative merits. In the open class for a collection displayed in a space of 9 by 6 feet, Mr. G. Fennell, The Gardens, Fairlawn, Tonbridge, was the premier exhibitor with a free and charming association of Palms, blue and white Chimney Campanulas (*C. pyramidalis*), a low panel of Harrison's Musk outlined with *Streptocarpus*, two bold front corner plants of *Draena Lindenii*, a central mound of Orchids, and a margin of variegated *Panicum*. Second, Mr. R. Edwards, gardener to Barelay Field, Esq., Beechy Lees, a trifle too crowded. Third, Mr. S. Cook, gardener to De Barri Crawshaw, Esq., Rosefield, extremely close. Fourth, Mr. J. Hiding, gardener to H. E. Gordon, Esq., Igtham. Fifth, Mr. A. Hoadley, gardener to F. L. Bevan, Esq., Kippington Park. In the local class for groups Mr. W. Searing, gardener to R. Monkton, Esq., was first

with a pleasing association of well-grown plants; Mr. W. Heath, gardener to Mrs. Petley, and Mr. W. Martin, gardener to W. W. Johnson, Esq., Claridge House, respectively with creditable collections.

Prizes were offered for tastefully arranged groups of Ferns, and some charming effects were produced. The chief prize was well won by Mr. A. Hatton with a back central column of Maidenhair and other Ferns flanked with rustic work attractively furnished. The groundwork of the space was occupied with *Adiantum cuneatum* interspersed with taller plants of *Pteris tricolor* and other distinct Ferns. Having regard to the different heights and colour tints of the plants, the equal of this collection has been rarely seen and perhaps never surpassed. Mr. Goodman was second, his noteworthy plants being well grown examples of *Adiantum farleyense*; Mr. Heath a close third, and Mr. Fennell fourth. His Fern groups were a distinct and delightful feature of the tent.

In the fruit classes there was good competition. For a collection of six varieties, Pines excluded, Mr. T. Osman, Ottershaw Park, Chertsey, secured the foremost place with good Grapes, Peaches, Nectarines, Figs, and a Melon; followed by Messrs. Fennell and Goodman. Mr. Osman was also first with three bunches of black Grapes—fine Black Hamburgs; Mr. Hoadley second with unusually good Muscat Hamburgs; and Mr. Robinson, Hollingbourne, third with the first named variety. For three bunches of white Grapes Mr. Sutton was well to the fore with superb Muscats, Mr. Osman second with larger but not quite finished bunches, and Mr. Goodman third with good Foster's Seedling. In the open class for three varieties of Grapes Mr. Sutton led the way with Muscat of Alexandria, Madresfield Court, and Black Hamburg; all very good. Mr. Osman was second, and Mr. Goodman a very close third. In the local classes there was great and good competition, Messrs. Martin, Searing, Todd, and Noble being the most successful exhibitors. Mr. Hatton had the best Peaches (Barrington) and Mr. Gibson the best Nectarines (Lord Napier). There was a good display of Apples and Plums.

The table decoration and cut flower tent was beautifully furnished and a great attraction to visitors. Ten tables were displayed, Mrs. W. Searing, a gardener's wife, securing the highest award in close and excellent competition. Her table was lightly furnished, delicately tinted Sweet Peas preponderating in the central epergne and side stands, small finger glasses each containing a *Pancreatum* flower set in *Gypsophila* and Fern. Mrs. Searle, an expert exhibitor, was a very close second with a tasteful and richer arrangement, and in turn was closely followed by other successful exhibitors. There was a large number of epergnes and bouquets, which cannot be particularised, nor can the cut flowers such as Roses, Dahlias, Asters, and others which contributed to the brightness of the marquee.

Vegetables must not be overlooked. In the two classes for nine and six dishes there were no less than twenty-seven exhibitors, the produce being neatly arranged in hampers, and as a rule excellent. Some of the Potatoes and Cauliflowers were too large, yet on the whole the display was most commendable, and competition as close as it well could be amongst the prizewinners. Mr. T. Robinson, Hollingbourne, after a long and close examination, was placed first with nine kinds, Cauliflowers, Carrots, Cucumbers, Onions, Peas, Potatoes, Scarlet Runners, Tomatoes, and Vegetable Marrows being of good medium size and high quality throughout. Mr. K. Baldwin, gardener to J. C. Crossley, Esq., Eynsford, was an extremely close second, and Mr. J. Snow, gardener to C. D. Murietta, Esq., Wadhurst Park, Sussex, third. There were eleven competitors. In the class for six kinds, sixteen hampers were placed in competition. Mr. J. Barney, Maidstone, won the chief prize with superior examples of Carrots, Onions, Peas, Potatoes, Tomatoes, and Vegetable Marrows. Mr. J. Buckland, Walthamstow Hall, and Mr. C. Noble, gardener to Miss Austin, Sevenoaks, followed very closely indeed in the order named. Five or six prizes would not have been too many in these splendidly filled classes. The cottagers' tent was filled with remarkably good produce, a credit to the growers of it and to the Show.

Amongst the trade exhibitors who contributed effectively to the Exhibition we noticed Messrs. Cannell & Sons, Swanley, a brilliant display of double *Begonias* and Dahlias; Messrs. James Carter & Co., Forest Hill, succulent plants and Cacti; Messrs. W. Cutbush & Sons, Highgate, a fine general display of plants and flowers; Messrs. J. Peed and Son, Norwood, good general collection; Mr. Charlton, Tunbridge Wells, a large assortment of herbaceous and border flowers; Mrs. Searle, Sevenoaks, cut flowers in great quantities; Messrs. Edmonds, Westerham, Sweet Peas and other flowers; Mr. Rumsey, Wrotham, Roses; and Mr. Spencer Chadwick, Shoreham, a good assortment of border Carnations.

The labour in connection with the Show must have been very great, but the experienced Secretary (Mr. A. Fenner) was equal to the task, and his coadjutors in charge of the several tents aided materially in the smooth working of the necessary details. The day was fine, visitors numerous, and there was every prospect of a financial success.

BURSTOW.—AUGUST 10TH.

THIS Show was held in delightful weather in the really charming grounds of Rede Hall, the residence of the famous anti-vaccinationist, W. Tebb, Esq., whose gardener, Mr. Cottle, is the esteemed Secretary. Burstow is quite a rural district, some three and a half miles from Horley station, and is, though in Surrey, close on to the borders of Sussex. The soil is largely of a stiff clay, that runs together and bakes; yet Conifers thrive wonderfully well on it, and at Bede Hall they grow literally by hundreds, singly, in clumps, and in lines or belts, so that a few years has enabled this beautiful place to become finely furnished

and well enclosed. The flower gardens and all departments are admirable, and a more charming place for a flower show, with the gardens all open to the public, could hardly be found.

In one tent a prominent feature filling the entire centre was a very fine group of plants arranged by Mr. Cottle. This comprised good Palms, Tree Ferns, Acalyphas, big plants, superbly coloured; rich Coleus, Dracenas, Caladiums, Fuchsias, Begonias, and Gloxinias in great variety. Messrs. Peed & Sons, Norwood, had a good group of plants. Mr. Tuck, gardener to R. B. Evered, Esq., Oatlands, had an effective group of Begonias in pots; Messrs. Cheal & Sons, Crawley, set up a charming collection of cut Dahlias, hardy flowers, &c.; Miss Emma Mepp, daughter of the reverend President, dressed a table with flowers and Ferns prettily, though rather too garish. All these exhibits were not for competition. Of groups in competition, all somewhat massive and heavy in character, the best was set up by Mr. Fock, Mr. Wilson, gardener to J. Russell, Esq., coming second. Mr. Bickerstaff, gardener to J. Henderson, Esq., Edlingham Park, had the best six plants in three Ferns, very good, and three foliage, *Cissus discolor*, a fine dark Coleus, and a well coloured Dracena. Mr. Tuck was second, having in his foliage two similar Caladiums and a good red Dracena. Mr. Payne, gardener to J. Sorham, Esq., Gatwick, had the best three Fuchsias in small but excellent pyramids.

Of fruit, the best two bunches of Grapes, excellent Muscat of Alexandria came from Mr. Wilson, and the second best, same variety, from Mr. F. Sutton, gardener to H. Donaldson, Esq., Haridsea. The best three dishes of fruit, Peaches, Figs, and Plums, all good, were from Mr. R. Cornford, gardener to J. Whitechurch, Esq., Westlands; Mr. Tuck being second with good Peaches and Nectarines, and moderate Raspberries. Mr. Payne had the best brace of pretty golden Melons, unnamed. Very admirably set up were the twelve bunches of flowers from Mr. E. Brown, gardener to W. Morris, Esq., Oakleigh; Mr. T. Spark, gardener to A. A. Dowley, Esq., coming second with good bunches too heavily arranged.

Vegetables were good, Mr. Sutton having the best six sorts, Mr. E. Brown being second. Mr. Catt, gardener to E. J. Miller, Esq., had in a beautiful sample of Wells' Improved the best Cucumbers. The best dish of Peas in the Show was Sharpe's Queen, and the best round and kidney Potatoes, Sutton's Satisfaction and Snowdrop. Vicia of Laleham was also excellent. Carrots were exceptionally clean and handsome, the cottagers' samples generally being of the handsomest and best description.

Late in the afternoon, after a large company had gathered, the prizes were distributed by Mr. Tebb from the terrace fronting the house, and immediately after Mr. A. Dean, representing the Surrey County Council's Technical Education Committee, who, with Mr. Wells, of Earlswood, was Judge, gave an address to a large and greatly interested audience, taking for his theme the exhibits at the Show, and using many examples as illustrations of what constituted quality and beauty of form, or the reverse. On the motion of Mr. Tebb, seconded by the Rev. N. E. Mepp, President of the Society, a very hearty vote of thanks was accorded to the lecturer.

WILTS.—AUGUST 10TH.

THE annual Exhibition of plants, fruits, flowers, and vegetables which the above Society held on the 10th inst. in the beautiful and well kept grounds surrounding the picturesque palace of the Lord Bishop of the Diocese (Salisbury), was one of the best hitherto held in the Wiltshire capital. The weather was beautifully fine, the exhibits staged numerous and generally of excellent quality, while the arrangements of the Show were all that could be desired, and reflected great credit on the Committee and the Hon. Secretary, Mr. W. H. Williams.

Plants were shown in fine condition. In the class for twelve stove and greenhouse plants, distinct, six foliage and six in flower, Mr. Cypher, Cheltenham, was a good first; Mr. Wills, Winchester Road, Shirley, Southampton, was second, and Mr. Curry, Wilton Road, Salisbury, third. Mr. Cypher's collection contained *Lantana borbonica*, about 14 feet across, having its huge leaves in very fine condition, *Cycas circinalis*, *Kentia australis*, *Crotos angustifolius* and *Sunset*, *Allamanda nobilis*, *Anthurium Schertzerianum*, having twenty-five or thirty fine spathes; *Erica Austiniana*, and *Statice profusa*, all bearing marks of high cultural skill. Mr. Wills' collection included good plants of *Kentia Forsteriana*, *Cycas revoluta*, and grandly flowered plants of *Bougainvillea glabra* and *Eucharis amazonica*. Mr. T. Wilkins, gardener to Lady Theodora Guest, Inwaxel, Henstridge, was easily first in the class for nine stove and greenhouse plants, four plants to be in bloom and five foliage; Mr. Wills was second, and Mr. Peel, gardener to Miss Todd, Salford Lodge, Shirley, third. All showed good plants.

Mr. Wilkins was a good first in the class for six exotic Ferns, staging large healthy plants of *Adiantum farleyense*, *A. cuneatum*, *Cyathea medullaris*, *Thamnopteris nidus avis*, *Davallia Mooreana*, and *Microlepia hirta cristata*. Mr. W. Peel was second, and Mr. Evans, gardener to Lady Ashburton, Melchet Court, Remsey, was third, staging good plants. Mr. A. Robey, gardener to Captain Greenwood, Harnham Cliffe, Salisbury, was first for six Begonias, Mr. Wilkins and Mr. Wills being second and third in that order. Mr. Robey was also first in the class confined to exhibitors residing within a radius of six miles of Salisbury, showing well grown plants in each class. Mr. Bedford, Harnham, Salisbury, had the best six Fuchsias, and Mr. Wills the second best, both showing creditable exhibits.

Groups of miscellaneous plants arranged for effect in semicircles,

ranging from 12 feet in the open classes to 8 feet in diameter in the amateur classes, filled the centre of one large tent, and viewed from the entrance, or indeed from any standpoint in the tent, the effect was very telling, the tall slender arching spikes of white flowers of *Francoa ramosa* giving the whole a very chaste and finished appearance. Mr. Wilkins secured the premier position in the two principal groups with admirable arrangements, each having a good plant of *Seasforthia elegans* in the centre, with "dot" plants of *Hyacinthus candicans*, *Tuberose*, *Colostia plumosa aurea*, *Coccy's Weddelliana*, *Cattleyas*, *Oncidiums*, *Cypripedium barbatum*, *Aralias*, and the aforesaid "Bridal Wreath" (*Francoa ramosa*), the plants being stood in a setting of Maidenhair Fern, and fringed with *Isolepis gracilis* and *Caladium argyrites*. Mr. Wills and Mr. Robey were respectively second and third in the large groups; the first prize in this class being £5, and that in the next most important £4. In this Mr. E. Carr, gardener to W. E. Gilbert, Esq., Oak Lodge, Bishopstoke, and Mr. Peel were second and third in the order in which their names appear with capital arrangements. In the class confined to amateurs residing within a radius of six miles of Salisbury, Mr. G. Bath, gardener to Col. Pepper, Milford Hill, Salisbury, was first; Mr. F. E. Pearce, Crane Street, Salisbury, a capital second; and Alderman Lovibond, St. Anne Street, Salisbury, a good third. In the class for groups arranged in a semicircle of 8 feet in diameter Mr. Huxman, gardener to H. G. Gregory, Esq., The Island, Salisbury, was first, and Mr. A. Maple, gardener to E. A. Rawlence, Esq., Newlands, Salisbury, second, both with good arrangements.

Owing to the approaching fruit Show at Earl's Court Mr. Ward, of Longford Castle Gardens, was, for the first time since the resuscitation of the old Wiltshire Society, a non-competitor in the fruit classes at this Show. However, there were a few new exhibitors, and the exhibits staged were fairly numerous, and for the most part of excellent quality. There were four collections of eight kinds (Pine excluded) staged. Mr. Evans, gardener to Lady Ashburton, Melchet Court, Remsey, was first, showing compact bunches of Gros Maroc Grape, fine in berry and colour, and large unripe bunches of Muscat of Alexandria, grand Brunswick Figs, Prince of Wales Peaches, Elrige Nectarines, Moorpark Apricots, Plums, and a Melon. Mr. McFarlane, gardener to William Baring, Esq., Norman Court, Salisbury, was a good second. Mr. Ingledfield, gardener to Sir John Kek, Bart., Tedworth House, Marlborough, was third. Grapes.—Out of five stands of three bunches of Muscat of Alexandria Mr. P. Davidson, gardener to Lord Wolverton, Iwerne House, Shaftesbury, was well first with medium-sized well-coloured bunches; Mr. Ingledfield being second; and Mr. Budd, gardener to F. G. Dalgety, Esq., Lockerby, Stockbridge, third. In the corresponding class for three bunches of Black Hamburg Mr. Davidson led the way again with large well-coloured bunches, being followed by Mr. Neville, gardener to F. W. Flight, Esq., Cornstiles, Fwyford, Winchester; and Mr. Warden, Clarendon Park, Salisbury, both showing well. Eight lots were staged. In the any other black Grape class Mr. Warden was first, staging fine examples of Madresfield Court, Mr. Davidson being second with the same variety, fine in bunch, berry, and finish; Mr. Evans being third. Mr. Warden was again well to the front in the "any other white Grape" class, staging large well-coloured bunches of Buckland Sweetwater. Mr. Wilkins was second with Foster's Seedling; and Mr. Allsop, gardener to Lord Portman, Bryanston, Blandford, third with Buckland Sweetwater. Out of eight Melons staged Hero of Lockinge, shown by Mr. Wilkins, was first. Mr. Ingledfield had the best six Peaches, showing large specimens of Walburton Admirable; and Mr. McFarlane had the second best, staging fine even fruits of Barrington. Mr. W. Grace, gardener to W. B. Neave, Esq., Fordingbridge, Hants, was first for Nectarines, Mr. McFarlane being second, both showing good fruits of Pineapple. Mr. Budd was first for a very good dish of Apricots; Mr. McFarlane was second; and Mr. Fred Smith, gardener to the Lord Bishop of Salisbury, was a good third. Eight lots were staged. Mr. F. Smith had the best dish of Plums, showing a dozen good fruits of Green Gage; Mr. Wilkins was second with the same variety; and Mr. B. West, gardener to J. B. Wygram, Esq., Northlands, Salisbury, third, showing good examples of Washington. Mr. Wilkins had the best three dishes of dessert Apples, the varieties shown being Beauty of Bath, White Astrachan, and Red Astrachan; Mr. F. Smith was a good second; and Mr. H. Brown, gardener to the Hon. Percy Wyndham, The Clouds, Tisbury, a creditable third. Mr. Smith was first with a like number of dishes of culinary Apples, showing large, clean, even fruits of The Queen, Ecklinville Seedling, and Lord Sutfield; Mr. Wilkins, who was second, staging Chancellor, Stirling Castle, and Warner's King. Mr. Budd was third. In the amateur classes Alderman Lovibond, Mr. A. Maple, Mr. Huxman, Mr. Robey, and Dr. W. D. Wilkes, The Causal, Salisbury, were the principal prizewinners.

In the class for collections of twelve kinds of vegetables (open classes) three collections were staged by Messrs. Ingledfield, Wilkins, and West. These staged by the two first-mentioned exhibitors bore evidence of high cultural skill, and were set up in beautifully green Parsley to the very best advantage. The prizes were awarded in the order in which the exhibitors' names appear. Mr. Ingledfield's collection contained good specimens of No Plus Ultra Runner Beans, Duke of Albany Peas, Intermediate Carrots, Moore's Vegetable Marrows, Satisfaction Potatoes, Onions, Globe Artichokes, Veitch's Autumn Giant Cauliflower, Sutton's Perfection Tomato, Fragnell's Exhibition Beet, Cucumbers, and Celery. In Mr. Wilkins' collection were grand specimens of Onions, large, shapely bulbs, and as hard as a deal board; Autumn Giant Cauliflowers, Celery, Peas, and Runner Beans (a deficiency in the numbers shown of these spoiled the chance of a higher position being accorded to the

collection), and Sutton's Perfection Tomato, the fruits being large, even, and highly coloured.

Mr. Neville and Dr. D. Seaton, Bitterne, Southampton, were first and second in that order for twenty-four Roses, single trusses, distinct. Mr. Browning, gardener to Rev. Sir Talbot Baker, Blandford, and Mr. West were first and second for stands of twelve blooms, distinct. Mr. Browning, Mr. Neville, Mr. West, Mr. Evans, Mr. Goodall, Mr. F. Hatch, Mr. Budd, Mr. Evans, and Mr. Wilkins secured other prizes for cut flowers. Miss Flight was first for a vase for decoration of dinner table with a very elegantly arranged stand. Miss Elsie King won the challenge trophy, value £3 3s., given for a dressed basket for drawing-room decoration, Miss Agnes Flight and Miss E. Burt being second and third with good all-round arrangements. These ladies, together with Mrs. W. F. Trask, were also successful in the buttonhole and shoulder spray classes. Mr. J. R. Chard, Stoke Newington, London, was well ahead in the class for two bouquets—one bridal and one hall-room.

Non-competitive exhibits were numerous. Messrs. Keynes, Williams and Co. covered good lengths of staging in the tents devoted to floral exhibits with stands of new Cactus Dahlias, Carnations, and Gladiolus. Among the new Cacti Dahlias may be mentioned Marchioness of Bath, soft crimson lake, shaded delicate pink towards the edge of the petals, a model Cactus in form; Lady Skelmersdale, chrome yellow, a striking variety; Countess of Radnor, of fine form and beautifully shaded rose cerise; and Countess of Gosford, amber, shaded soft vermilion, one of the most striking varieties yet raised. Messrs. R. Veitch and Son, Exeter, also staged an extensive and varied lot of cut flowers of herbaceous and alpine plants, as well as plants themselves growing in small pots, together with stands of new Carnations. Mr. Pritchard, Christchurch, and Mr. B. Ladhams, Shirley, also made a good show of cut herbaceous flowers. Mr. Davis, Yeovil, contributed stands of double and single Begonias, the flowers being of fine size and form, and of various shades of bright and pleasing colours. Mr. Hamlin, The Palace, Salisbury, obtained a certificate for a small greenhouse set on wheels, so as to be easily shifted from one part of the garden or premises to another, as circumstances may require.

MAIDENHEAD.—AUGUST 11TH.

AN excellent Exhibition was held at Maidenhead this year, all the departments being strongly supported, and the quality throughout highly satisfactory. The neighbourhood is one in which good gardeners abound; in fact, within a radius of a few miles some of the best cultivators in the South of England practise. If there is one point on which they are markedly weak it is in grouping. We commented on this a year or two ago, and there is still no particular improvement to record. It is not very easy to see why this should be the case. There is no doubt abundance of material at command, and if exhibitors do not know how to make the best of it they should not be too proud to take lessons at other shows. In fairness it should be stated that the method of planning the Exhibition tells very much against them. Space is not provided for the groups at the sides of the tent on the ground level, but they have to be packed on the flat stages amongst a heterogeneous mixture of specimen foliage and flowering plants. This is altogether wrong. Grouping is now so important a part of the exhibitor's art that Maidenhead should not rest under the reproach of being behind the times. The fruit was very good indeed, and the vegetables in competition for special prizes were splendid. The Show was held in the grounds of Curtisfield, and was so extensive that the Judges had a prolonged task.

The first prize group 12 feet by 10 was that of Mr. J. Lindsay, gardener to the Dowager Duchess of Buccleuch, and it was full of healthy well grown plants, but was much too flat and uniform. Broadly speaking it was composed of a level bed of Ferns sprinkled with Caladiums and Streptocarpus, and Tuberoses, Lilliums, Francoas, Gladioli, Crotons, Dracenas, and other plants rising above them. On what we presume was the second prize group no card was discoverable, but Mr. W. H. Austin was third. Mr. Lockie, gardener to G. Fitzgerald, Esq., was first with a group half the size; Mr. E. Johnson, gardener to A. Gilliat, Esq., being second; Mr. Richardson, gardener to G. Herring, Esq., third; and Mr. Paxton, gardener to the Hon. C. S. Irby, fourth. The truest kindness would be to say as little about these as possible, for they were so packed and hemmed in by other exhibits that all effect was lost.

Foliage plants were not large, but very clean and healthy. This remark applies forcibly to Mr. Lockie's first prize twelve in 8-inch pots, which were full of quality, and perfect for their size. Mr. Fulford, gardener to J. Lambert, Esq., was second. Mr. Lindsay had the best single specimen, a fine *Gymnogramma Alstoni*. Mr. Lindsay won with six stove and greenhouse Ferns, exhibiting good and very healthy plants of *Microlepia hirta cristata*, *Adiantum Lathomi*, *A. farleyense*, *A. cardiochlaena* and *Gymnogramma Alstoni*. Mr. Lockie had some large and shapely Fuchsias, and won with six plants, Charming and Emily Lye being the best. Mr. Hopkins, gardener to J. W. Burrows, Esq., was second with large but somewhat loose plants, and Mr. Lindsay third. Excellent table material was staged by Mr. Johnson, who won from Messrs. Lindsay and Fulford. Zonal Pelargoniums were finely shown by Mr. Lindsay, who had large plants full of good trusses. He was first for six with Queen of the Whites, Constance, F. V. Raspail, Lucie Lemoine, Lucy Mason, and Omphale. Most of them were 4 feet across. Mr. Hopkins was second with smaller plants carrying good trusses. Begonias were not quite satisfactory. The flowers were good and the plants large, but the latter were full of stakes. Mr. Deadman,

gardener to T. Higgin, Esq., was first, Mr. Lockie second, and Mr. Goodman, gardener to Miss Hammersley, third. Coleuses as shown by Mr. W. H. Castle, gardener to E. A. Tonge, Esq., were large and well coloured, meriting the first prize they received. Mr. Hopkins won with Cockscombs, and the best single specimen flowering plant came from Mr. Lockie. It was a single *Begonia* 3½ feet high, and as much through. Mr. Paxton was second. Messrs. Paxton and Lockie were first and second with Gloxinias.

Cut flowers were very attractive. Mr. W. Taylor and Mr. Wicks were to the front with Roses. With Dahlias Messrs. Tranter, J. Walker, Pond, Wheeler, and Mills secured the prizes, Mr. Pond's blooms being magnificent. Zinnias were finely shown by Messrs. Broughton, Tranter, Young, and Davis; Asters by Messrs. Young, Wright, and Pond; Cactus Dahlias by Mr. Diddams; bouquets by Mr. Broughton; buttonholes by Mr. Herrin of Dropmore; floral arrangements by Mrs. Beckett; and baskets by Miss Vardy.

Fruit was both well and extensively shown. Mr. J. Gibson, gardener to Earl Cowley, won with six dishes. He had good Black Hamburg Grapes, excellent Hale's Early Peaches, and fine Black Tartarian Cherries. Mr. Osman, gardener to L. J. Baker, Esq., was a close second. His Black Hamburg Grapes were good, but smaller in berry than those of Mr. Gibson, while the Muscats were not coloured. Mr. Goodman was third with Brown Turkey Figs and Dagmar Peaches very good. With four dishes Mr. Marcham, gardener to Miss Arnott, was first, and Mr. Paxton second. There was good competition with open-air fruit, four dishes. Mr. Goodman was first with Early Gage Plums, Moor Park Apricots—very good; Red Joaneting Apples, and Windsor Pears. Mr. Osman was second, his best dish being that of Hale's Early Peach, and Mr. Lindsay third. Black Hamburg Grapes were excellently shown by Mr. Marcham, being very fine in bunch, berry, colour, and bloom. Mr. Gibson was second and Mr. Osman third. Well coloured clusters of Alicante secured Mr. Goodman the first prize for any other black; Mr. Osman being second with Madresfield Court, not fully coloured; and Mr. C. Mills, Clewer, third, with Alicante. Mr. Johnson had some very good bunches of Muscats, and was placed first, Messrs. Osman and Paxton following. In the "any other white" class Foster's Seedling was exclusively shown. Mr. Osman won with highly creditable clusters, and the other prizes went to Mr. Johnson and Mr. Goodman.

Peaches and Nectarines were good, Mr. Johnson winning in the class for the former with Grosse Mignonne, and Mr. Paxton in that for the latter with Lord Napier. The minor awards went to Messrs. Goodman and the other exhibitors named. Mr. Lockie was first for a Melon, Sutton's Seedling, a neat, beautifully netted, orange-fleshed fruit of delicious flavour representing him. Mr. Johnson was second with The Countess, and Mr. Gibson third with Sutton's Imperial Green Flesh. Mr. Goodman was first for Plums, winning with a very good dish of Jefferson's; Mr. Pond being second with Victoria, and Mr. Hopkins third with Peach. In the class for dessert Apples some excellent fruit of Irish Peach came from Mr. J. Davis, Mr. Goodman being second, and Mr. Castle third. The prizes for culinary varieties went to Messrs. Paxton, Diddams, and Goodman.

The class for twelve Tomatoes brought a number of admirable dishes. Mr. Mackay won with Webb's Regina, a handsome and very heavy fruit; Mr. Allen was second with Perfection, and Mr. Knight third. The Society offered prizes for vegetables, and also several of the leading seedsmen. Mr. Paxton won with kidney Potatoes in the former section, having a splendid dish of Sutton's Seedling; Mr. Hobley was second with Sutton's Satisfaction, and Mr. Lindsay third with Seedling. Messrs. Quelch, Lockie (who showed Satisfaction), and Lindsay won with rounds. The first named won with Cauliflowers, Mr. C. Young with Onions, Mr. Lockie with Cucumbers, Mr. Lindsay with Celery, and Mr. Head with Peas. Messrs. Carter & Co.'s prizes brought some excellent produce. Six kinds were asked for, and excellent Early Defiance Cauliflower, Giant Rocca Onion, Snowdrop Potato, Perfection Tomato, Intermediate Carrot, and Telephone Pea secured the premier award for Mr. Goodman. Mr. Young followed with Solid Ivory Celery, Snowball Turnip, and Telephone Pea, very good; and Mr. Quelch was third. Messrs. Sutton & Sons also offered prizes for six kinds, Mr. Lockie winning with an excellent collection, composed of New Intermediate Carrot, Satisfaction Potato, Reading Perfection Tomato, Early Autumn Mammoth Cauliflower, Sutton's Exhibition Onion, and Perfection Marrowfat Pea. Mr. Johnson was second with Autumn Mammoth Cauliflower and Satisfaction Potato, very good; and Mr. Goodman third. Mr. Lockie also secured the principal of Messrs. Webb's prizes for six kinds, and he again staged excellent produce, consisting of Webb's Defiance Intermediate Carrot, Wordsley Queen Potato, Sensation Tomato, Early Mammoth Cauliflower, Exhibition Onion, and Talisman Pea. Mr. Mackay was second with Stourbridge Glory Potato and Stourbridge Gem Cucumber, excellent; and Mr. Paxton third. Mr. W. Broughton's special prizes were secured by Messrs. Brown, Herbert, and Willis.

Attractive miscellaneous contributions were made to the Show by Messrs. J. Veitch & Sons, Mr. E. F. Such, Mr. J. Walker, Mr. Robert Owen, and Mr. Chas. Turner.

ABERDARE.—AUGUST 11TH.

THE ninth annual fixture of the above Society proved in every respect a thorough success, and can lay indisputable claim to being one of the best shows in the principality. This season, as for several years past, the Show was held in the picturesque park adjoining

Abernant House, which is placed at the disposal of the Committee by James Lewis, Esq., the popular proprietor.

The principal prizetakers in the open plant classes were Mr. Cypher, Cheltenham; Mr. Comley, gardener to J. Lewis, Esq., Abernant; and Mr. J. Speck, Llanelly. In the corresponding classes for fruit, Mr. Hawkins, gardener to Mrs. Turberville, Ewenny Priory; Mr. Comley, Abernant; Mr. Silk, gardener to T. M. Franklin, Esq., St. Hilary; Mr. Stone, gardener to Lord Aberdare; and Mr. Morris, gardener to A. P. Vivian, Esq., Taibach, were successful. Vegetables were well shown, the honours falling to Mr. Pugsley, gardener to General Lee, Dinas-Powis; Mr. Croft, gardener to Mrs. Palmer, Rheola; Mr. Morris, Taibach; and Mr. Cole, Aberdare. The amateur and cottager classes were well and excellently filled, the exhibits being of a high order of merit.

It is hardly necessary to comment upon the quality of plants shown with such names as Cypher among the exhibitors, and the fruit consisted of very fine and well finished examples as a rule. Among honorary exhibits in addition to the local trade, Messrs. W. Clibran and Sons, Altrincham and Manchester, staged a good collection of Roses and popular herbaceous flowers.

A run through the extensive glass department in Abernant Gardens proved that Mr. Comley had not exhausted his stock of show fruit, though he had staged heavily. His house of Madresfield Court, almost intact, was a fine sight, and from his later houses we may expect to see the grower giving a good account of himself at some of the autumn shows. Pine Apples are still well and largely grown there. Capital fruit were put up successfully at this Show, and Mr. Comley might well have sent them further a-field.—VISITOR.

TAUNTON DEANE.—AUGUST 11TH.

THIS flourishing Society held its twenty-ninth annual Exhibition under the most favourable circumstances. The day was a perfect one; there was brilliant sunshine, which was tempered by a cool northerly wind; indeed, some of those who attended the Show stated that the thermometer in the morning went down to freezing point. This combination tended to make the day a most enjoyable one, and brought together a very large concourse of visitors. The whole town was *en fête*, and the streets were crowded by an immense concourse of people. The way in which these horticultural gatherings are looked forward to in the west is a very striking contrast to the lukewarm manner in which such meetings are regarded in our home counties. The neighbouring gentry make a point of being at home, and no other arrangements are allowed to interfere with their being present at this annual fête; while the railway brings thousands of visitors from the neighbouring towns as far as Bristol and Bath on the one side, and Torquay and Exeter on the other. The cottagers, too, from the neighbourhood flock in in great numbers, taking a keen interest in all, especially in the cottagers' productions, which are of great excellence, so that altogether everything conspired to mark the day as a most successful one. The beautiful vale of Taunton has a fertile soil and a most genial and forward climate. When I left my own home yesterday I had not a single spike of *Gladiolus* in bloom, and in fact only one or two which were showing colour, while grand spikes were exhibited at the Show evidencing some fortnight in advance of us. I, however, found that other places in the neighbourhood did not share this earliness, and that it must be specially assigned to this much-favoured vale.

I have now for many years—some thirteen or fourteen—been permitted to assist at this Show, and have during this time noticed many and important changes, not merely in the personnel of the exhibitors, but in the character of the exhibits, perhaps the most conspicuous being in the large plants shown in the big class for stove and greenhouse plants. I can recollect when in the class for twelve stove and greenhouse plants in flower there were large plants shown which ran one another very close, when Messrs. Lawless, Cleave, Pilgrim, and others had but few points between them. Now Mr. James Cypher of Cheltenham is the only exhibitor who shows them, and there is a great fall between the first and second collections. They were well grown and excellently flowered, but they were not half the size of those shown by the celebrated Cheltenham grower. Then again there used to be classes for tricolor, silver, and bronze Nosegays and other Pelargoniums, while now there are but two classes for single and double Zonals. Groups of plants arranged for effect have been added, and Begonias, both double and single, have taken the place of Pelargoniums. There are still some classes which might with advantage be cut out from the schedule, notably Verbenas, Phloxes, Cockscombs, and Petunias, while more encouragement might well be given to herbaceous plants, of which delightful class there are many ardent cultivators in the neighbourhood, and if they were exhibited in greater numbers would doubtless tend to increase in number.

Mr. James Cypher, who carried off as usual the first prize in the class for twelve stove and greenhouse plants, had fine examples grown in his usual style of excellence of *Clerodendron Balfourianum*, *Allamanda nobilis*, *Allamanda Hendersoni*, *Bougainvillea glabra*, *Anthurium Schertzerianum*, *Ixora Pilgrimi*, and others. Mr. Mould was second, and amongst his plants was a fine *Statice Gilberti* and a good *Erica tricolor*. In the class for six stove and greenhouse plants Mr. Cypher was again first with fine plants of *Statice profusa*, *Allamanda nobilis*, *Erica oblata*, *Ixora Williamsi*, and *Phenocoma prolifera*. Mr. Brooks was second with smaller plants. In the class for eight fine-foliaged plants Mr. Cypher was again first with some grand plants, *Croton angustifolius*, like a shower of gold, *Latania borbonica* and *Croton*

Sunset being very bright and good, *Cordyline indivisa*, *Kentia australis*, *Dasyliion glaucum*. J. Curnee, Esq., was second, and Mr. Mould third. In the class for exotic Ferns W. Brooks, Esq., was first; he had some fine specimens, amongst which were *Davallia Mooreana*, *Nephrolepis nidus avis*, and *Dicksonia antarctica*. One great improvement has been effected of late years in the arrangement of these fine plants in the centre of the large tent. Instead of being pushed up upon stages, where the pots could be well seen, and the plants but very indifferently, they are all placed on the ground, so that they are seen to the fullest advantage. Round the sides are placed on the one side Begonias, Pelargoniums, and other plants in pots, while the other is devoted to cut flowers, of which there is always a good display. The Begonias shown by Mr. W. H. Fowler were finely grown, and were of course fine varieties. He had Mrs. J. G. Goschen, Tower of Gold, Florence, R. D. Parsons, Mrs. French, and Spitfire, very brilliant in colour. These plants were admirable in growth, not overtrained, and clear and bright in colour. Mr. Goddin was second. The Pelargoniums do not need much notice; they were, as usual here, excellently flowered, but to my mind overtrained, the stakes being much too prominent. There was also a considerable falling off in the Fuchsias, which used at one time to be shown in great excellence.

It was hardly to be expected at this season that there would be a great competition in Roses, indeed it was confined in the classes for thirty-six and eighteen distinct varieties to Messrs. Perkins of Coventry and Mr. S. P. Budd of Bath, but both exhibitors showed remarkably well, and ran each other very close. Mr. Perkins' stand for thirty-six consisted of Charles Lefebvre, Comtesse de Camando, Etienne Levet, Martin Cahazel, bright rose shaded with crimson; Emilie Hausburg, Mr. W. H. Eaton, a seedling of Messrs. Perkins, light rose, shaded with crimson; Her Majesty, Mrs. C. Wood, Dr. Andry, Alfred Colomb, Heinrich Schultheis, Duke of Connaught, Elie Morel, Ferdinand de Lesseps, A. K. Williams, Marie Verdier, Perle des Jardins, Duc de Rohan, Comte Raimbaud, Earl of Dufferin, Devienne Lamy, Mrs. John Laing, and Duke of Wellington. Mr. Budd's stand ran this very close, the flowers being very fresh and of good colour, but a little wanting in size. In the class for eighteen the same competitors occupied the same position, Mr. Perkins' stand containing Emilie Hausburg, Captain Christy, Marie Baumann, Alfred Colomb, Her Majesty, Heinrich Schultheis, and Innocente Pirola. In the class for eighteen Teas and Noisettes Mr. W. H. Fowler exhibited a very beautiful stand, in which were some grand flowers. *Souvenir d'un Ami* was one of the finest blooms of this variety I have seen this year; especially fine, too, were *Souvenir d'Elise Vardon*, a large and well developed flower; Comtesse de Nadaillac, a superb bloom of great substance, and beautiful in colour; Jean Ducher; Marie Van Houtte; Ernest Metz, very fine both in form and colour; Madame Hoste, excellent.

Owing to the lateness of the season, as I have already said, *Gladioli* were not largely represented. Even Mr. Kelway, who usually has a grand bank of them, had only a couple of rows. It is needless to say that these were very fine, and several of them received first-class certificates. In the class for twenty-four spikes, not less than twelve varieties, Mr. W. H. Fowler had a magnificent stand, comprising Mrs. Fowler, the grand seedling of Mr. Kelway's of which I wrote last year, and which I consider the best that he has ever raised, fine in form and novel in colour; *Enchanteresse*, a magnificent spike of this charming pure white French variety; *Formosa*, very pretty; Dr. Balby, brilliant red; *Flamboyant*, fiery crimson; *Juliette*, very pretty; *Conquerant*, *Protée*, *Leandre*, *Horace Vernet*, *Adolphe Brogniart*, *Schiller*, &c. This stand was peculiarly interesting to me, as our celebrated Somersetshire grower has always contested my assertion that it was a good plan to cut the bulbs in halves before planting, saying it would never answer, and yet every one of these spikes was from cut bulbs; and as these were of such good quality it cannot be urged that the practice is a bad one. Mr. Davis of Yeovil had a very fine stand of double Begonia blooms, but as a rule the other cut blooms did not present many features of interest, if we except the classes for Carnations, in which there was a very sharp contest, both in the open and amateurs' classes, between Mrs. McAlister and Mr. W. H. Fowler, the latter winning in the class for twelve blooms; Mr. Fowler was first and Mrs. McAlister second. Among the flowers exhibited were Charles I., Germania, J. B. Bryant, Mrs. Sharp, Mrs. McLaren, Countess of Jersey, Victory, Alice, Thérèse, Terra Cotta, Mrs. Barlow, Grostee, Prince of Orange, and The Governor. When I remember what used to be shown in these classes here I am quite astonished at the improvement; true, the victors are both new exhibitors, and have evidently thrown themselves with real ardour into the cultivation of these beautiful and now popular flowers.

The second tent, which was entirely devoted to amateurs, was in most respects a repetition of the first, the trade element being eliminated; the centre was occupied in the same way with large stove and greenhouse plants. Foliage plants and Ferns were very much the same as those exhibited in the open class, but of course not so large. The end of the stage on entering was occupied by a group of plants and cut flowers from Messrs. Robert Veitch & Son, the principal point of attraction to the visitors being the boxes of fine blooms of Carnations and Picotees. Amongst them, besides those already noted above, were *Romulus*, Charles Henry, Marie Douglas, Stadtrath Bail, the fine new yellow flaked Carnation from Benary of Erfurt, King of Scarlets, &c. Besides these they had some fine *Gloxinias*, a few Orchids, amongst which was a good plant of *Disa grandiflora*: these were not for competition. In the Roses in this tent, confined to amateurs, Mr. S. P. Budd, or as we rosarians rather prefer to call him, Dr. Budd, exhibited two beautiful

stands of twenty-four and twelve distinct varieties, in which were some excellent flowers, while in the class for twelve Teas and Noisettes Mr. W. H. Fowler carried off the first prize with a stand which might well have been shown in the height of the Rose season with a good prospect of carrying off honours. Among the flowers were magnificent blooms of Comtesse de Nadaillac, Souvenir d'un Ami, Souvenir d'Elise Vardon, grand; Jean Ducher, Marie Van Houtte, &c. It was a great treat to see such a stand at this season of the year, and confirmed my opinion that Mr. Fowler will be a very formidable competitor to most of our most foremost growers of Tea Roses. He had also another fine stand of twelve Gladioli, amongst which was Madame Aubro, a new French variety to which a first class certificate was awarded.

Nothing is more remarkable to one who has attended these Shows for many years than the vast improvement which has taken place in table decorations. I remember when Miss Cypher used to arrange one of her exquisite tables here, which only served to bring out the very poor and tasteless character of the others; but now she has retired. Her teaching has had its effect, and some very beautiful arrangements were exhibited. There is nothing in which so much difference of opinion exists, and especially amongst ladies, as to the merits of exhibits in this class. My own opinion still is, that that of Mrs. McAllister, to which the second prize was awarded, ought to have taken a higher place. It was mainly composed of Iceland Poppies, and was exceedingly light and graceful.

I have only in this report drawn attention to some of the exhibits, for it would be not very profitable, I think, to go more into detail, although there were a large number of both plants and cut flowers which were very beautiful and examples of good cultivation; but enough has been done, I hope, to show that this fine Exhibition still maintains its high position, and is a centre of good influence on horticulture and its kindred sciences to the West of England. I need hardly add that all the arrangements were well carried out, and that the officials, especially the Hon. Secretaries, Messrs. Maynard and Hammett, did all that lay in their power to make it pleasant for exhibitors, judges, and visitors.—*D., Deal.*

TAUNTON FRUIT CLASSES.

It was generally considered the best show of fruit and vegetables that has ever been seen at Taunton. In addition to all the classes being exceptionally well filled it was also observable that very little inferior produce was staged. There were six entries for a collection of ten dishes of fruit, five being brought. Mr. W. Iggulden, gardener to the Earl of Cork, Marston House, Frome, succeeded in winning the first prize, and also a silver medal offered for the most meritorious exhibit in the fruit classes. His best dishes were very well finished Madresfield Court Grape, Golden Gem Melon, Sea Eagle Peaches, and Oullins Golden Plum. Mr. J. Lloyd, gardener to Vincent Stuckey, Esq., Langport, was a very close second, having very good Muscat of Alexandria and Black Hamburgh Grapes, a grand seedling Melon, fine Bellegarde Peaches, and other good dishes. The third prize went to Mr. Crossman, gardener to J. Brutton, Esq., Ycovil, the front dishes in this case being remarkably good, but the Grapes were poor. Seven staged collections of four varieties of fruit, but the prizes went to the same exhibitors and in the same order as in the larger class.

Ten competed with Black Hamburgh Grapes, the first prize going to Mr. F. Crossman, gardener to Earl Poulet, who had large bunches, the berries also being large, but not particularly well finished. Mr. Iggulden followed with smaller but much better finished bunches. There was good competition in the any other black class, Mr. C. Warden, Clarendon Park Gardens, Salisbury, being first with very good Madresfield Court, Mr. Iggulden following with neat, well finished bunches of the same variety. The best Muscat of Alexandria, the bunches being heavy and fairly well ripened, were shown by Mr. W. Conolly, gardener to J. R. C. Talbot, Esq., Lyme Regis, Mr. Iggulden again being second with small well coloured bunches. In the any other white classes all the prizes went to Buckland Sweetwater, Mr. Warden being well first with grand clusters; and Mr. Webber, gardener to G. F. Luttrell, Esq., Dunster Castle, a good second.

Melons were numerous shown, but the majority cut badly. Mr. Lloyd was first for Davenham at its best, and Mr. F. Crossman second. Peaches were shown remarkably well, Mr. J. Crossman being first with a perfect dish of Dymond, and Mr. Lloyd second with good Bellegarde. Nectarines again were numerous and good, and with these Mr. J. Crossman gained the first prize, staging extra good fruit of Pine Apple, Mr. Daffurn, Weston-super-Mare, being second with Elruge in good condition. Mr. Webber was first and Mr. Huxtable second with Apricots, and the principal winners in the other fruit classes were Messrs. Crossman, Iggulden, Sanford, Tottle, Tucker, Perkins, and G. Garraway.

VEGETABLES filled one large tent and half of another, cottagers contributing extensively. Coarseness rather prevails, and the tendency seems too much towards great size, especially in the Potato classes. The principal prizewinners in the open classes were Messrs. Garraway, J. Crossman, Webber, W. Greedy (gardener to Major Borton), H. Moore, W. M. Bryant, H. F. Manley, G. Ricks, W. A. Sanford, A. Tucker (gardener to Major Wise), and F. J. C. Parsons.

ST. ALBANS.—AUGUST 11TH.

WITHOUT doubt this was the best Show in the history of the Society. The weather was fortunately fine—a new feature in St. Albans Shows. Throughout the Exhibition the quality of most things staged was of the best, and in some classes the competition was very keen.

For stove and greenhouse plants Mr. Nutting, gardener to B. Maple, Esq., M.P., secured the first prize with some beautiful specimens, followed closely by Mr. Fergusson, gardener to Mr. MacIlwraith. Mr. Nutting was again first for flowering or foliage plants, with Mr. Sconce, gardener to J. S. Hill, Esq., Hawkswiek, second. This exhibitor was awarded first prize for six exotic Ferns. Some beautiful plants were shown, a fine *Adiantum farleyense* standing out well from the others.

For a group of plants arranged for effect Mr. Nutting again won the first prize with a very light and graceful group, and Mr. Sconce was a good second. A new feature was the offer of a prize for the best arranged group of variegated ornamental foliage plants to cover a space of 12 feet by 6 feet. This was secured by Mr. E. Beckett, gardener to H. H. Gibbs, Esq., Aldenham House, with a very finely coloured collection. Roses did not bring many competitors, but the specimens staged were good considering the time of the year. Mr. Beckett was first for twenty-four H.P.s, and Mr. Wilsher, gardener to W. H. Bingham-Cox, Esq., of Tolmers Minns, was second. These gentlemen took the same position for six Teas. Mr. F. W. Bush, an amateur of St. Alban's, was first for twelve H.P. Roses. Cut stove and greenhouse flowers were a fine exhibit, and the Judges had some difficulty in awarding the prizes, which were given to Messrs. Beckett and T. Nutting respectively. An offer for a prize for an unlimited number of herbaceous flowers brought one of the prettiest exhibits of the Show, Mr. Beckett being first with a collection of fifty varieties. For twelve kinds of herbaceous flowers Messrs. F. J. Smith & Son, nurserymen, St. Albans, gained the first prize.

Fruit made a fine show. For white and black Grapes Mr. Beckett was awarded first prize with some fine coloured Muscat of Alexandria and Gros Maroe, Mr. Nutting taking second in each class. Peaches, Nectarines, Melons, Cherries, and Apples were also well shown.

Vegetables made a large display, and the competition was very keen indeed. The first prize offered by Messrs. Sutton & Sons fell to Mr. Beckett, and the second to Mr. G. Dormer, gardener to Mr. Rowland, Elstree. Mr. Beckett seemed invincible, for the first prize offered by Messrs. J. Carter & Co. was also adjudged to him. The table decorations were very pretty and good, the arrangement being on tables 7 feet by 4 feet 6 inches.

The honorary exhibitors were numerous. Mr. Gibbs, Aldenham House, contributed four fine Palms for the centre of the large tent. Mr. Paul of the Old Nurseries, Cheshunt, and Messrs. Paul & Son of Waltham Cross both contributed a good number of cut Roses and bunches of herbaceous flowers. Mr. Cutbush had a pleasing group of miscellaneous plants near the entrance, and Mr. Spriggings of St. Albans had staged a small group opposite to the entrance. Mr. Sander of St. Albans sent a number of Orchids, and it is almost superfluous to add that they were good. Cottagers' classes were well filled, and generally their staging showed a decided improvement.

THE NATIONAL CARNATION AND PICOTEE SOCIETY, NORTHERN DIVISION.

THE annual Exhibition of the Northern Section took place at the Royal Botanic Gardens, Manchester, on Saturday, the 13th inst., and there was a good number of growers and flowers. The Picotees were fine generally, many of the flowers especially so; and the Carnations also were of good quality.

In the class for twelve Carnations, dissimilar, Mr. Tom Lord, Todmorden, was first with an excellent stand, having Master Fred, Mercury, James Douglas, Seedling C.B., Bruce Findlay, very fine; William Skirving, Sybil, Admiral Curzon, very fine (also the premier bloom); J. D. Hextall, Master Stanley, Seedling R.F., fine; Dan Godfrey, and Robert Houlgrave. Second, Mr. R. Sydenham, Birmingham, with Master Fred, Gordon Lewis, and Sarah Payne, very fine; Sportsman, Alisemond, Edward Adams, Thalia, Joseph Lakin, William Skirving, Lovely Mary, George Melville, and Admiral Curzon. Third, Mr. A. R. Brown, Birmingham, with Edward Adams, Fanny Hudson, R. Thomson, J. D. Hextall, Squire Whitham, Sportsman, C. H. Herbert, Alisemond, Robert Houlgrave, Sarah Payne, Biddy Malone, and Richard Bealey. Fourth, Mr. J. Whitham, Hebden Bridge. Fifth, Messrs. Thomson and Co., Birmingham. Sixth, Mr. H. Geggie, Bury, Lancashire. In the class for six Carnations, dissimilar, first, Mr. Crossly Head, Hebden Bridge, with J. D. Hextall, very fine; Sybil, Dan Godfrey, Mayor of Nottingham, Master Fred, and Robert Houlgrave. Second, Mr. C. F. Thurstan, Wolverhampton, with James Merryweather, very fine; Ivanhoe, Crista Galli, William Skirving, Sir Garnet Wolseley, and Robert Houlgrave. Third, Mr. J. Bleackley, Whitefield; fourth, Mr. J. Edwards, Manchester; fifth, Mr. S. Barlow; sixth, Mr. C. Thorniley, Middleton; seventh, Mr. W. Bacon, Derby; eighth, Mr. W. Taylor, Middleton.

For twelve Picotees, dissimilar, there was a strong and close competition. First, Messrs. Thomson & Co., Birmingham, with a superb stand of flowers, comprising grand blooms of Little Phil, Henry (unusually fine), Nellie, Campanini, Thomas William (very fine indeed), Mrs. A. Chancellor (very fine and bright in colour), Dr. Huxley (medium rose edged, of spotless purity), Mrs. Sharp, John Smith, Constance Heron, Elizabeth, and Brunette. Second, Mr. R. Sydenham with Dr. Epps (very clean ground and bright), Little Phil, Favourite (very fine), Lakin's Ne Plus Ultra (an extra bright heavy red edged), Amy Robsart, Ann Lord, Norman Carr, Zerlina, Mrs. Gorton, Mrs. Sharp (very fine), Mary, and Lady Holmesdale. Third, Mr. T. Lord with Little Phil, Ann Lord (very pure and fine), Brunette, Norman Carr,

Henry, Miss Lord, Alice, Miss Wood, Campanini, Clara Penson, Isabella Lakin, and Muriel. Fourth, Mr. A. R. Brown, a very fine John Smith and Little Phil being in his stand. Fifth, Mr. A. W. Jones, Birmingham, John Smith, Mrs. Payne, and Lady Louisa, all fine; and sixth, Mr. H. Geggie. For six Picotees, dissimilar.—First, Mr. Thurstan with Zerlina (very pure in colour and exceedingly fine, also the premier Picotee), Edith D'Ombra, Thomas William, Mrs. Rudd, Morning Star, and Nymph. Second, Mr. J. Edwards with J. B. Bryant, Little Phil, Daisy, Clara Penson, Mrs. Edwards, and Jessie. Third, Mr. J. Bleackley. Fourth, Mr. W. Bacon. Fifth, Mr. C. Head. Sixth, Mr. C. Thorniley. Seventh, Mr. W. Bacon. Eighth, Mr. W. Taylor.

For twelve selfs, not more than two flowers of a variety, first Messrs. Thomson & Co., Birmingham, with a very fine lot of blooms, comprising a seedling, rosy purple, very fine; Germania, very fine; Gilbert, a very fine bright rosy carmine; Blushing Bride, a fine bloom; Ariadne, bright shaded carmine rose, and very fine; Negress, very dark, rich colour; Gladys, Seedling, rich shaded purple; Mrs. J. Chamberlain, a lovely salmon colour; Mrs. Fred, a very fine bloom; and Aurora (two blooms), a rich deep crimson self. Second, Mr. A. R. Brown with Purple Emperor, Mrs. Fred, Germania, King of Purples, Mrs. Muir, Ruby, Matador, Scarlet Queen, and others. Third, Mr. J. Edwards. For six selfs, not more than two flowers of any one variety, first Mr. A. W. Jones with Germania, very fine; Gladys (two blooms), very fine and bright; Emma Lakin (two blooms); Mrs. McLaren, fine. Second, Mr. W. Kenyon with Purple Emperor, fine; Mrs. Reynolds Hole (two blooms), Pride of Peshurst, Gladys, and Seedling. Third, Mr. W. Bacon with Germania, Mrs. Fred, and Seedlings. Fourth, Mr. J. Bleackley.

Twelve Fancy varieties, not more than two of any one variety.—First, Messrs. Thomson & Co., Birmingham, with grand flowers—viz., A. W. Jones (two blooms), Countess of Jersey, Dodwell's S. 152, Terra Cotta, Victory, Schleiben, Mrs. R. Sydenham, a great acquisition, a decided improvement on Countess of Jersey; Mornson, new; Dodwell's Seedling 166, Madame Van Houtte, and Benary's F.H. Haage, very distinct and fine. Second, Mr. A. R. Brown with Lord Rendelsham, very fine; two blooms of Mrs. Robert Sydenham, very fine; Victory, Maud, Sparkler, Broekhaus, Schleiben, Duke of Albany, A. W. Jones, and Terra Cotta. Third, Mr. B. Simonite, Sheffield, and in this stand were two new flowers, Mrs. Barlow, fine petal, but dull in colour; and Duchess of Portland, bright canary flaked with lake and orange. Six Fancy varieties, not more than two blooms of a variety.—First, Mr. R. Sydenham with Janira, Lord Rendelsham, Victory, and Schleiben. Second, Mr. A. W. Jones with Alfred Grey, A. W. Jones, Stadtrath Bail (two blooms), Janira, and Mrs. R. Sydenham.

Single blooms.—Scarlet Bizarre.—First and second Mr. T. Lord, with Robert Houlgrave and Master Stanley, and Admiral Curzon third and fourth. Fifth, Mr. A. R. Brown with George. Crimson Bizarre.—Mr. T. Lord first and second with Master Fred; third and fifth, Mr. Sydenham, with same; Mr. J. Whitham, fourth, with J. D. Hextall. Pink and Purple Bizarre.—Mr. Lord was first and third with seedling Bruce Findlay, and fourth with William Skirving. Mr. Sydenham second and fifth with Sarah Payne. Scarlet Flake.—Mr. Brown first, second, third, and fourth with Sportsman. Mr. T. Lord fifth with Tom Lord. Rose Flake.—Mr. Simonite first and second with seedling J. P. Sharp, a very fine new variety. Mr. Lord third with Sybil, Mr. R. Sydenham fourth with Thalia, Mr. J. Bleackley fifth with Thalia. Purple Flake.—Mr. A. R. Brown first with Squire Whitbourn, Mr. Bleackley second and fourth with Dr. Foster, Mr. Sydenham third with Gordon Lewis, Messrs. Thomson & Co. fifth with the same.

PICOTEES.—Heavy Red-edge.—Mr. Brown first with John Smith and second with Mary Austiss. Third, Messrs. Thomson & Co. with Dr. Epps. Fourth, Mr. Jones, and fifth, Mr. Sydenham with John Smith. Light Red-edge.—Mr. Brown first with Thomas William. Second, third, fourth, and fifth, Mr. Jones with the same. Heavy Purple-edge.—First, Mr. Thurstan with Zerlina. Second, Mr. Sydenham with Muriel. Third and fourth, Mr. Jones with Calypso and Muriel. Fifth, Mr. Brown with Muriel. Light Purple-edge.—First, Mr. Jones with Clara Penson. Second, Mr. Brown with Sylvia. Third, Mr. Sydenham with Ann Lord. Fourth, Mr. Brown with Elizabeth. Fifth, Mr. Bleackley with Mary. Heavy Rose and Scarlet-edge.—First, Mr. Jones. Second, Mr. Brown with Campanini. Third, Mr. Brown with Little Phil. Fourth, Messrs. Thomson & Co. with Campanini. Fifth, Mr. Geggie with Seedling. Light Rose and Scarlet-edge.—First, third, and fourth, Messrs. Thomson and Co. with Nellie. Second, Mr. Bleackley with Thalia. Fifth, Mr. Jones with Mrs. Payne.

Premier blooms, Bizarre or Flake Carnation.—Mr. T. Lord with Admiral Curzon. Picotee.—Mr. Thurstan with Zerlina.

Certificates were awarded to Mr. B. Simonite for a very fine Rose-flake Carnation named J. P. Sharp, and to Mr. T. Lord for a fine P.P.B. Carnation named Bruce Findlay.

CLARENDON PARK, LEICESTER.

THIS was the first of what it is intended shall be an annual summer Flower Show and Fête, promoted by the horticultural section of the Clarendon Park and Knighton Mutual Improvement and Recreative Society. It was held in the grounds of Stoneygate House, kindly lent for the purpose by R. Toller, Esq., and which—being of considerable extent, containing an abundance of excellent timber, and fine old gardens well stocked and in excellent keeping—was specially well adapted for such a purpose. The weather proved most favourable, and we are pleased to record that, both in the extent and quality of the exhibits and in the

number of visitors to the Show, the Committee achieved a most gratifying success.

Three tents were filled with exhibits, one being almost entirely devoted to those sent in not for competition, and which formed the best and most attractive features of the Show. Down the centre of this tent were five very attractive groups of foliage and flowering plants, all not for competition. A most charming and tastefully arranged group—the best in this respect we have ever seen at any show in Leicester—was that set up by Mr. G. R. Lawson, gardener to Mrs. G. H. Ellis, Knighton, Hayes. The same exhibitor also had six grand specimens of exotic Ferns, not for competition. They were *Adiantum fragrantissimum*, *Adiantum grandiceps*; a seedling *Adiantum*, apparently intermediate between *A. decorum* and *A. tenerum*, a grand specimen; *Davallia Mooreana*, *Nephrolepis davallioides furcans*, and *Pteris serrulata cristata*. These were all very large specimens, perfect in colour, freshness, and symmetry, reflecting the highest credit upon the exhibitor. A fine group was exhibited by Mr. J. Smith, gardener to S. Bennet, Esq., which deservedly received much admiration, but it differed greatly in style and arrangement from that above mentioned. Mr. Lawson is to be congratulated in having given to Leicester gardeners a useful object lesson in grouping, which was much needed; the banking closely together of a far too large amount of material for the space occupied, so that each plant loses its individuality, seeming hitherto to have been inseparable from Leicester groups. An attractive group, containing some very fine *Crinum*s, was shown by Mr. W. Dodd, gardener to Simpson Gce, Esq.

Mr. James Wright, nurseryman and seedsman, Granby Street and Thurmaston, exhibited six very fine plants of Zonal Pelargoniums, double and single, not for competition, also cut flowers of Dahlias, Show, Pompon, and Cactus, and Tuberos Begonias. In another tent Mr. T. Scott, florist, Knighton, had a charming group of plants, mostly of a size adapted to market work, remarkably fresh, clean, and bright; and in the same tent was a bright and attractive group of Orchids, containing good specimens, well flowered, of *Cattleya Gaskelliana*, *Dendrobium Deari*, *Epidendrum vitellinum majus*, and others lent by J. G. Ward, Esq.

The exhibits of vegetables and cut flowers were very numerous and good in all the classes, the cottagers especially showing numerous and well. The indefatigable Hon. Sec., Mr. W. Bell, was a successful exhibitor in many of the classes devoted to amateurs, his exhibits of specimen foliage and flowering plants and Ferns being especially commendable.

In addition to the Flower Show numerous other attractions were provided in a cricket match between gardeners and coachmen, the former proving the victors by over forty runs, a long programme of sports, an excellent brass band, and a glee party. In the evening the grounds were very prettily illuminated with Chinese lanterns, dancing being carried on in the tents.

HARDY FRUIT GARDEN.

Seasonable Pruning.—If rightly managed previously only the needful stopping of shoots of Apples and Pears that have been or are being produced, claims attention. These shoots, termed laterals, are produced at various intervals during the present and succeeding month, the greater number extending in the strongest parts of the trees. They start as a rule from the uppermost buds of the shortened summer shoots, and when once fairly started into growth make rapid progress. To allow them to remain is to rob the buds below of their promising fruitful character by attracting the sap away. This will be disastrous to the production of fruitful spurs, and may be avoided by pinching or cutting the new growths back to the first leaf, thus concentrating the sap in the parts where most wanted to develop firm prominent fruit buds. If these laterals again break into growth and produce sub-laterals the latter must be pinched back in the same way to one leaf. No doubt many shoots which were too weak, short, or undeveloped in character at the summer pruning will now be found possessing the right characteristics, and therefore may be pruned to three or four full-sized leaves in the ordinary way. Gross sappy shoots starting from latent buds in the old wood are invariably useless and need not be retained.

Thinning out is another form of pruning applicable to unrestricted trees and bushes. If not already practised to relieve trees of crowded branches, no time must be lost in doing so. Such relief will admit the necessary light and air among the others for the ripening of the wood. Currants, Gooseberries, standard Apples, Pears, Plums, and Cherries will all be benefited by the operation if necessary to perform it.

Peaches, Nectarines, and Apricots.—Much attention is now necessary to trees that are bearing crops of fruit. Proper support must be given to fruits that appear to require it by securing the bearing shoot in a safe position. Also see that nothing prevents free swelling and ripening. Large leaves may require fastening aside to admit light and expose the fruits to the sun. Gather the ripe

fruit only when dry. Keep the roots of the trees moist, or the crops will not finish well. Copious supplies of water will be needed in dry weather, loosening the soil to ensure easy admission of the fluid to the roots as far as they extend, but be careful not to injure fibres near the surface. Liquid manure will be beneficial to heavily cropped trees. Insects, such as earwigs and woodlice, are troublesome now. Hollow beanstalks 6 or 8 inches long, or brown paper folded in lengths several times and placed between the wall and the branches, form good traps for the earwigs, from which they are easily dislodged into an empty bottle or a vessel of hot water. It is now necessary to remove finally all the superfluous shoots, and fasten in close to the wall the leading and other growths intended to be reserved, in order to quickly ripen the wood. The upper and strongest shoots need attention first. The lower shoots and those not very vigorous may remain to the last. The latter will be induced to grow by remaining free a short time longer. As soon as the fruit has been gathered a raid must be made on red spider, which soon attacks the foliage when it is subject to heavy demands, as it is during fruit ripening and in very dry weather. Heavy syringings with soapy water, 2 ozs. of soft soap to the gallon of water, or any of the numerous insecticides, will, if directed well to the under surfaces of the leaves, soon destroy the pest. It may be kept in check afterwards by the frequent use of clean water, with occasional doses of soapy water. Retaining the foliage healthy to the last is an important detail in successful culture.

Gathering Early Apples and Pears.—The early varieties of Apples such as Joaneting, Devonshire Quarrenden, Mr. Gladstone, and Red Astrachan, together with Williams' Bon Chrétien, Jargonelle, Citron des Carmes, and other early Pears, will be ready to gather during this month when grown under favourable conditions in suitable situations. Select a period when the fruit is dry and cool, and as near maturity as possible, without running the risk of letting it hang too long. The best test for gathering ripe fruit is the easy detachment of the fruits from the spurs. If not wanted for immediate use, lay each fruit separately and carefully in a cool dry place.

Protecting Fruit.—Birds are generally the first intruders upon ripening fruits. Where they are known to be troublesome the trees should be netted over at an early stage to prevent injury. Wasps may be caught by hanging bottles of sweetened beer in the trees. Late Gooseberries and Currants, also Morello Cherries on wall-trained trees intended to be kept as long as possible, should be protected from wet as well as birds and insects.

Raspberries.—As soon as all the fruit has been gathered cut away the bearing canes in order to admit light and air to the present season's growth to admit of its becoming well ripened. Remove also all the weak growths and short useless suckers, which choke the better growths and impoverish the ground, besides being very untidy and forming harbours for insects.

Strawberries.—Continue planting young rooted runners at suitable opportunities. Plenty of strong plants with abundance of fibrous roots can now be found in the spaces between the plants, especially where wide planting is practised. Those rooted among a crowded mass of runners and shaded by rank leafage are of little use, and should not be employed. Sturdy plants always prove the most satisfactory. Make a reserve bed of young plants, placing them 6 inches apart. These will prove useful in the spring for filling up vacancies or for forming new beds. All the young plants wanted having been secured, lose no further time in clearing the beds completely of runners and weeds. Recently planted beds will also need a little attention in cutting away the small runners that extend from them. See that none of the young plants suffer from want of water. Once fairly started they will grow with rapidity until October and develop bold crowns.

FRUIT FORCING.

Peaches and Nectarines.—*Earliest Forced Trees.*—The trees being exposed to the full influences of the air by the removal of the roof lights will be greatly benefited through the foliage being cleansed by rain and invigorated by night dews. This will aid in swelling the buds without inducing over-development, and if the soil of the borders is thoroughly moistened by rain or watering the buds are not likely to be cast at a later period. A vital point in the continued early forcing of Peaches and Nectarines is to prevent the trees starting into growth prematurely. This can only be prevented by keeping them cool, along with some outlets for the sap in moderate lateral growths, and the preservation of the foliage in health. When the roof lights are fixed the trees should have all the air possible, and they must not suffer by want of water at the roots or the buds will become defective and fall when the sap ascends.

Succession Houses.—When the fruit is gathered cut out all the bearing wood of this season unless forming extensions, and the shoots for next year's fruiting where too crowded should be thinned to admit light and air to assist the ripening of the wood. Afterwards cleanse the foliage thoroughly with water from the syringe or garden engine. The roof lights should be removed as soon as the wood is ripe and the buds are plump, unless the trees are young and there is any doubt about the ripeness of the wood, when a temperature of 80° or 85° should be maintained from sun heat, and the ventilators thrown open at night. Supply water to the roots so as to keep the soil in a moist condition. Weakly trees will be benefited by the application of liquid manure.

Late Houses.—Let the fruit have full exposure to the sun, drawing leaves aside, shortening them if necessary, and raising depending

fruit with its apex to the light by laths placed crosswise of the trellis. Keep the growths tied as they advance in length. Stop or remove gross growths, and let all have full exposure to light. Laterals should be kept well in hand, but they may be allowed moderate extension in the case of trees carrying heavy crops so as to attract the sap to the fruit, and maintain activity at the roots. Trees carrying light crops and having strong wood and much lateral growth should be marked for lifting or cutting the roots as soon as the wood is sufficiently firm. This should be done a month to six weeks in advance of the leaves falling. Continue the syringing on fine days in the morning and afternoon until the fruit commences ripening, but on dull days damp the house instead of syringing the trees. Provide a little ventilation constantly, and increase it early in the day.

Ripening the Fruit.—If it is desired to facilitate the ripening of the fruit the temperature through the day may be kept at 80° to 85°, closing in the afternoon early enough to raise the heat to 90° or 95°, and before nightfall admit a little air at the top of the house, so as to permit of any excess of moisture escaping, and to induce a cooling of the atmosphere and rest. The increased temperature must be accompanied by a correspondingly moist atmosphere. In other circumstances allow no opportunity of free ventilation to be neglected; but in case of high winds it is well to moderate the ventilation, admitting air on the opposite side to that from which the wind blows, and closing must be attended to, so as to prevent an unusually low temperature at night. See that the borders inside and outside have sufficient water, never allowing the soil to become so dry as to cause the foliage to become limp, as that may check the fruit in swelling, and cause premature ripening, thin flesh, and poor in flavour. A light mulching of short lumpy manure will tend to keep the soil moist, attract the roots to the surface, and the water will carry the manurial elements down to the roots. Liquid manure should be supplied to weakly trees and those carrying heavy crops.

Cucumbers.—Old plants which have been bearing from an early part of the season produce about this time, or soon after, knobby ended fruits. These are poor for use, and still less attractive in appearance, but they are essential for seed, as the long and straight handsome fruit are less prolific, even when the flowers are fertilised. Seed bearing, however, is fatal to the production in quantity of useful fruit. Old plants may be kept in a bearing condition by cutting out the old growths and encouraging young, so as to insure a succession of bearing wood. Train this thinly, removing old leaves to afford room for new growths, and stopping at one joint beyond the fruit. The surface soil should be removed, and fresh lumpy loam supplied. Plants that have been in bearing in frames some time will be restored to vigour by a free thinning out of the old shoots and the addition of a little fresh loam, giving a moderate watering and a sprinkling over the foliage on bright afternoons, closing at about 3 P.M. With linings to the beds, and the protection of mats over the lights, Cucumbers will be produced for a lengthened period.

Autumn-fruiting Plants.—These should be encouraged to make a strong growth by earthing betimes, applying enough soil each time to cover the protruding roots, and taking care to have the soil moist and warm. Supply water to the roots only when wanted, and give a thorough supply each time. Syringe at 3 P.M., damping in the morning, at noon, and in the evening in bright weather. Maintain a night temperature of 65° to 70°, 70° to 75° by day artificially, 80° to 90° from sun heat, and close between 80° and 85°, and so as to increase to 90°, 95°, or even 100°. Train the growths rather thinly, allowing about 12 inches between the side growths, and stop them at about a foot's growth to give the needful fruiting and furnishing growths. Remove all fruits and male flowers as they show, so as to induce strong growth the early part of September, being sufficiently early to allow fruit to show for cutting at the end of that month, then by cropping lightly at first a good supply of fruit can be had later on, when it is most wanted. Avoid over-luxuriance by rich surface dressings and the too free use of liquid manure, but secure plenty of roots by sweet compost and a sturdy, thoroughly solidified growth, by judicious ventilation and full exposure of the foliage to the light.

Houses for Winter Fruit.—The structure must be light and efficiently heated both at the top and bottom, and means of ventilation be provided so that air can be admitted when necessary without creating a prejudicial current. The plants will have been raised from seed, say about the 10th of this month, if not the sowing of the seed must not be further delayed. Pot the plants as soon as ready, shift them as they require more root space, keep them near the glass, and place a small stick to each for its support, growing the plants without stopping, but rubbing off side shoots as they appear to the height of the trellis. In the meanwhile the house should be thoroughly cleansed and repaired, or painting completed. Remove all the old soil, and making everything as sweet as possible so that the plants may have a chance, winter Cucumber growing being much easier to write about than to practise successfully.

PLANT HOUSES.

Chrysanthemums.—Some care is needed in the selection of flower buds on those plants that have been grown for the production of exhibition blooms. The growths that surround the flower bud should be removed carefully with the point of a knife directly they can be distinguished. If by any chance the flower bud is not healthy or well formed allow one of the shoots to lead away again; this in due course will

form another bud at the extremity of the shoot, which will be surrounded by flower buds instead of growth. Directly the flower buds have been secured top-dress the plants with a compost of rich material. If root action is healthy the plants will soon take possession of it, and the aim must be to keep the roots active until the last, if the finest of blooms are to be secured. This is readily accomplished once the roots are on the surface by placing a little of some suitable artificial manure on at intervals of a fortnight. Weak stimulants may be given every time the plants need water, but strong doses must be carefully avoided, or more harm than good will result. It often happens that the roots are burnt at this stage by overfeeding. It is a good plan to place a bag of soot in the tank from which water is daily used. An additional stimulant may be made by placing 1 lb. of nitrate of soda and 2 lbs. of superphosphate in a tank containing 40 gallons of water. This may be further mixed with water and given twice a week. Liquid from the farmyard in a weak state may also be given as a substitute occasionally. Watch for aphides, and if they show in the points destroy them at once by the aid of tobacco powder. Keep the growths well tied to their stakes for fear of strong winds breaking them. Syringe the plants freely twice daily when bright. Those grown as bushes for cutting should be liberally supplied with stimulants. Where a number of fair blooms are preferred to a greater number of smaller ones the crown buds in each case should be selected. Tops that have been rooted into 3 and 4-inch pots should be stood in an open sunny position.

Calceolarias.—Plants that are large enough for 2-inch pots should be placed into them at once. Grow them in frames with a north aspect where they can be kept cool and moist. Prick seedlings into pans and boxes and grow them under the same conditions. Watch for slugs, which are very troublesome to these plants.

Carnations.—Plants of *Souvenir de la Malmaison* that have done flowering may be turned out of their pots into light soil, and the growths layered. This is best done by laying the plants on their sides. If kept somewhat moist afterwards the layers will soon form roots, when they may be taken off and potted singly. Plants that are healthy and have flowered in 6-inch pots may be placed into 8-inch. Use for these three parts of good fibry loam, one part of leaf soil, one-seventh of decayed manure, and a liberal quantity of sand. Water the plants carefully until they are rooting freely in the new soil, but on no account allow them to become dust dry. Until the approach of frost they are better outside on a bed of ashes than under glass. When kept under glass they are liable to be attacked by red spider.

Mignonette.—Be careful that pyramids and standards that are growing freely do not root through the base into the ashes upon which they are standing. If allowed to root through freely the plants are checked when removed. Take care that they do not become dry; water them occasionally with soot water in a clear state. Give artificial manure occasionally to the surface of the soil. Remove all flowers as they appear, and keep the growths tied to the trellis upon which they are trained. Give the plants abundance of air. Thin out plants that have been sown in 6-inch pots; seven or eight plants in each will be ample. Another good batch may be sown, and another early in September for spring flowering. These when sown should be placed in cold frames, shading with a mat until the seed has germinated.

Roman Hyacinths.—The earliest batches of these should be potted without delay; place five bulbs in each 5-inch pot. If the soil is in an intermediate state for moisture do not give any water, but plunge them in ashes at once before the soil becomes dry. It is a good plan to place them behind a north wall at this season of the year, and to place over the pots an extra covering of ashes. Successional batches may be potted at intervals of three weeks or a month until the end of October.

Freesias.—Imported tubers may be potted at once. These do well in 4-inch pots, the tubers being placed thickly together in sandy, moderately rich soil. If possible place them in a frame where the pots can be covered beneath 1 inch of cocoa-nut fibre refuse, and shaded by the aid of mats until they start into growth. Those that have been resting outside may be turned out and spread out to dry if they are not in that condition. These can be potted in batches as may be required.

Kalosanthes.—Plants that have flowered may be cut close back and allowed to break into growth. Any shoots that have failed to flower may be placed singly into small pots, or a number together in 5 or 6-inch pots. These if rooted without forcing them into growth, and then freely exposed to the sun, will flower another year. If an increase of stock is needed the stems may be cut into lengths; these make capital plants, as they branch freely, but need to be grown for two seasons before they are in a condition to flower. Plants that were cut back last year must be freely exposed to sun and air to ripen and harden them before they are housed for the winter.

Lilium candidum.—Where these are appreciated in pots no time should be lost in potting imported bulbs. These, if of the largest size, should be placed into 7-inch pots, covering the bulbs with about 2 inches of soil. Plunge the pots beneath 2 inches of cocoa-nut fibre refuse until they grow through, when the plunging material may be removed and the plants watered. Home-grown bulbs may be lifted as soon as the flowers fade if needed for potting. Whether home-grown or imported they can be stood outside until the approach of frost if frame room cannot be spared for them, but as a rule they do not start so freely into growth.

THE BEE-KEEPER.

APIARIAN NOTES.

THE HONEY SEASON.

FOR miles round about here the honey yield is poor; very few finished supers have been secured. Most hives at the present time are in a much better condition than they were at the same time in 1891. Prime swarms are, as a rule, weighty, and altogether at variance with the evidence of that sage who says, "No honey can be got from prime swarms," and who further says he is the guiding star to Scotch bee-keepers. The last is, perhaps, not verbatim, but is in meaning the same.

SWARMING.

As there are many erroneous opinions amongst bee-keepers on this subject, and even amongst some who assume to be authorities, it is perhaps an opportune time to help them a little by stating a few facts about it. Swarming takes place under different circumstances; in early spring by an effete or diseased queen or a drone breeder, or it may be through incipient foul brood. Premature swarms leave hives when the queen has become exhausted and young ones are raised to supersede her. These swarms should be returned, and unless the weather is favourable, and there are plenty of drones, should be joined to another hive. Proper swarms leave the hive when it becomes crowded and all the cells are filled with honey, eggs, and larvæ; the young bees by an unexplainable instinct having for about a week previously built many royal cells around eggs destined to become mothers. These are matured in sixteen days from the laying of the egg, and if the weather is favourable the first swarm would issue about eight days after their commencement, but not unfrequently the weather is untoward, and swarming is delayed till some of them are hatched, when it is a question whether the old or young queens will be saved, sometimes the one and sometimes the other. Although sixteen days is the allotted time, the bees seal the cells anew after they have protruded their tongues and been fed, and will keep them prisoners for several weeks.

THE SEALING OF THE ROYAL CELLS

is attached to the side walls by a gummy adhesiveness, which until the sixteenth day is tough, and like one and the same; but after that time it loses its adhesiveness and becomes brittle, inclining to leave the side walls, which the slightest pressure from within forces open and the queen escapes. The sealing appears to be a spun fabric, slightly covered with wax and pollen.

SIGNS OF SWARMING.

Only practical bee-keepers can determine the time a hive is likely to swarm by external appearances. Generally, the bees take rallying flights a day or two beforehand, but the most certain indications are the almost entire cessation from work, and the bees filling themselves with honey from the stocks' stores. They do this in relays, and the gorged bees can be recognised on the alighting board. After this they begin to fly as if to rally, and then the well-known swarming sound, familiar to the bee-keeper's ear, is heard. If the time is favourable the bees will leave, and even those that were out foraging will join the swarm after it has been hived. The bees of the swarm and the stock will remain separate, even although their positions are changed, unless the latter is removed a long way distant or to within doors. It will be observed, then, that swarming is premeditated days before the event, and the bees are not urged on to swarm by the loud hum of the drones or of bees either. Previous to, and at swarming, drones remain in the stock hive more than at any other time, and few of them go with the swarm. The first swarm issues because of the presence of queen cells containing young princesses.

AFTER SWARMS.

These issue on the same principle. At this time, with so many royal cells to guard, the swarming fever runs high. Each detachment, had they bees, would form a nucleus, but this would be ruinous, so many of the young princesses are destroyed, some by the bees and some by a queen. The queens still in the cell are often imprisoned for several weeks, as the bees destroy them reluctantly, and if there are bees with one hatched queen and all the others in their cells, a swarm will issue even although separated by a queen excluder.

To preserve young queens it is necessary to have them caged over queen excluder zinc in an otherwise queenless hive. The reluctance of bees to destroy royal cells shows how faulty the method is of returning an after swarm so long as a queen cell

exists. Brood-spreading, together with the returning of after swarms as hinted at above, is advice after the fashion of "drawing a bow at a venture," and is as deceptive as it is absurd and disappointing to the novice. Many who have tried and depended on the wholesomeness of the advice will not do so again.

PLURALITY OF QUEENS.

In all stocks, unless timely destroyed, this is a great hindrance to profitable bee-keeping, because weeks may pass before the queen to reign is selected, hence the loss of the best of the season. Always bear in mind that virgin queens long in a hive are a certain loss to the bee-keeper, and the reverse the opposite.

PUNICS.

I observe at page 134 there is a clerical error. "Its contents being 50 lbs." should read 60 lbs., being about a third heavier than any other swarm in the neighbourhood.

The crossed Punics have kept up their reputation as good honey gatherers, mild tempered, and steady working. One hive, a prime swarm, of these bees has given 40 lbs. of super honey, irrespective of what the body of the hive contains. The last time it was weighed its nett contents were 65 lbs., not bad for a season like the present, in which there has never been a complete working day for the bees, mostly not more than two hours. The prevailing winds have been from north to north-east and north-west, directions during which little or no honey is secreted. These cold, barren winds, with low temperatures, neither fill the air with sweet odours nor hives with honey.

PROSPECTS OF THE HEATHER.

The Heather is late in flowering this year, but it may be remembered that for several years past the finest weather occurred in September, so that lateness of flowers does not signify no honey.

I am likely to stay beside my bees for some time, and will watch their proceedings and notify the results of the different varieties to readers.—A LANARKSHIRE BEE-KEEPER.

TRADE CATALOGUES RECEIVED.

Messrs. Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, London, S.W.—*Bulbs.*

* * * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Seedling Begonia and Petunia (*R. Creighton*).—The Begonia is one of the Hollyhock-flowered section of doubles, and the colour, bright salmon pink, is attractive. If the variety is a free bloomer, of compact habit, and with strong flower stems carrying the blooms well clear of the leaves it is a good one. The Petunia, a fringed double white with violet centre, is very beautiful.

Packing Grapes (*Packer*).—If you pack the Grapes carefully in the manner you suggest they ought not to suffer from shaking; but as nearly a fortnight must elapse from the time they are cut until they are unpacked, it would probably be well to pack a wide-mouthed bottle with a tightly-fitting cork in the basket, and bore a hole through the cork to pass the stem through, wedging it to prevent shaking and the escape of water.

Dahlias Sporting (*E. Johnson*).—It is by no means unusual for Dahlias to produce flowers differing in colour on the same plants. We have seen hundreds of examples. In some cases half the blooms may be of one colour, the other half quite different, and on the same plants the entire blooms may be of a different colour from the majority on the plant. Some varieties are more prone to change than others in the manner indicated.

Screen under Cedar Trees (*B. D. K.*).—If the shade is very dense you will probably have some difficulty in inducing shrubs to grow freely under Cedar trees. Nor is the shade alone an obstacle, for the dry impoverished soil must be inimical to growth. We have seen Evergreen Privet grow very well under trees, but only when excavations have been made, the old soil removed, and fresh introduced for planting in. This was also kept moist by periodical waterings, and mulching the surface with manure or decayed vegetable matter. Earth moisture is essential for the growth of the shrubs.

Gros Maroc and Gros Colman Grapes (*Robert Mackellar*).—The Grapes you send are correctly named and very fine examples of the respective varieties. They are distinct in foliage and fruit. Occasionally the leaves of Gros Maroc develop a round or almost flattened form as in your case, but the difference in the quality of the fruit is very apparent. There is a suspicion of "earthiness" in the Gros Colmans, whereas the Gros Marocs are vinous and sprightly. The judges erred as others might have done in judging by appearance alone, but all the same the varieties are quite distinct, and we are glad to see such evidence of good culture.

Saving Seed of Ten-week Stocks to Secure Double Flowers (*H. H.*).—The seed saved at random from single flowers produces a very large percentage of single-flowered plants; but seed saved from the finest single-flowered, grown specially for the purpose, afford a large percentage of double-flowered plants. Your only chance of saving seed to secure a large portion of plants with double flowers is to grow the best of the single-flowered plants in pots and under glass, selecting those only for producing seed which have large flowers, and if possible with more than four petals, feeding the plants highly, but not excessively, so as to secure fine pods and good plump seeds, which require the protection of glass in this country to ripen perfectly. The plants should be raised from seed early in the season so as to give them ample time to grow and mature the seed.

Vallota purpurea Treatment (*T. F. W.*).—This fine late summer and autumn flowering bulbous plant does not require any particular treatment to insure its free blooming, but it is necessary that the plants have a light situation in a greenhouse, and as near the glass as may be without touching at all times, especially during the winter, and be kept properly but not needlessly supplied with water. Overpotting is a great evil, and the removal of the suckers destructive of fine specimens. The plants may yet flower, as there is ample time for them to do so, and the flowers are more valuable late than early. The thing is to get the plants strong by growing them in plenty of light, and then they will form fine bulbs, and throw up two scapes of flowers each.

Chrysanthemum Shoots Shrivelled at the Points (*X. Y. Z.*).—The Chrysanthemum shoots are infested with a "rust" or minute fungus (a Septoria), which at this time of year affects the growing points of various plants, including Vine laterals and the terminal growths of young Vines, causing them to become brown and to shrivel. An allied species infests Tomatoes, Pear trees, Cherry and Apple trees, and seems to be largely on the increase. The remedies for these minute parasitical fungi have only reached the initiatory stage. The plants should be grown as hardily as possible, but the locality has a good deal to do with the susceptibility of the plants to attacks; a wet cold subsoil favours the assaults through the increase of night dews and fogs.

Cucumbers Failing (*H. J. W.*).—We received the small Cucumbers before our last issue was printed, and they were referred to on page 134, but your letter did not reach us till after our reply was published. If you are correct in saying "they have had every possible requisite attention bestowed upon them" you may conclude they are the victims of disease, but we cannot say it has been introduced by the seed. We have seen hundreds of similar Cucumbers in a house. The border was covered with soapy manure and quite wet, but when we examined the soil down to the slates over the heating chamber it was very much too dry. After the error was rectified the fruits set and swelled freely. You say you have "used a lot of cow manure." We do not know what a "lot" means, but we know it can be used in excess for Cucumbers. Try the effect of rough turfy loam with a seventh part of wood ashes and half that quantity of lime. Maintain a night temperature of 65°, manage the ventilation and atmospheric moisture judiciously, and the change from your treatment may perhaps do good.

Scars on Apples (*J. C.*).—The "scars" are probably due to moisture resting on the skin of the fruit next the eye in the early stages of growth, and has caused the destruction of the outer skin, and the "rust" or russet has spread in consequence of the growth of the fruit, and another skin has been formed in its place, the russet being the useless matter cast off in the formation of the new skin. The edge of the scar is quite as distinct as when it was first formed, the new skin being distinct from the old, and it will be so until the growth of the Apple is complete. There is no fungus of a destructive nature, certainly.

no scab fungus, to which the scars have some resemblance at first sight; the scab fungus entirely destroys the epidermal tissues, and proves so destructive to the flesh immediately beneath as to prevent the formation of a skin, consequently the fruit cracks through the contraction and efforts at expansion or growth on the part of the fruit cells. The scars are great disfigurements, but quite unpreventible, and need cause no anxiety.

Various (Kittie).—1, We fear slugs would devour Stocks as well as hardy annuals in a narrow border between a Yew hedge and Ivy edging. We suspect the position would be too dry for Violas, and you do not wish to employ tender bedding plants. Why not employ hardy border flowers such as Pinks, Carnations, and various other kinds? We could give a selection if desired, and if you repeat the length and width of the border. If you prefer a gay border at small cost it might be had by sowing seeds of dwarf Tropæolums, and slugs seldom destroy these plants. 2, We should bud the Briars now that you intend moving in the winter, as even in case of the failure of some, you could cut back the stems for producing others to bud next year. 3, If you wish for the greatest possible number of Roses, they will be had by pegging down the long growths, or bending them in the form of arches with the points affixed to the ground. In pruning Roses a good rule is to leave the strongest growths the longest, and to cut back the weakest the most closely.

Moving Magnolia (T. F. W.).—The Magnolia, we presume, is an evergreen, such as *M. grandiflora* or an allied species or variety, and in that case it may be moved in the way you describe—namely, by making a trench all round—that is, on the front, as the tree is against a wall, and at such distance from the stem as to preserve a fair amount of roots, which will be laid in 3 or 4 feet from the stem. Make the trench so deep as to be sure of the main lateral roots, and all the down roots should be cut off at that depth by working from the trench under the tree and ball to the wall. The tree may then be drawn back to the desired place, and if care is taken to preserve a good ball, to carefully fill in the soil about the roots, and give a good watering, there is every chance of success. The moving may be done towards the end of September, or by the middle of that month, but take the precaution to well water the tree in advance of commencing operations, so as to have the soil thoroughly moist to the extent of the intended ball. If the tree is a deciduous variety it should not be moved until the leaves are matured and commence falling.

Celery Failing (A Constant Reader).—Canker at the roots causes the plants to become stunted and yellow as you describe, and is generally attributed to an excess of oxide of iron, but the roots are sometimes corroded by other corrosive substances, such as manure that has become sodden and sour, or water that has got impregnated with deleterious matter. We can only suggest applications of soot, a little sprinkled over the plants and on the sides of the rows, and a sprinkling of nitrate of soda on the sides of the rows, but clear of the plants, would no doubt send the latter off with a bound, but the merest sprinkling only should be given, or it will cause the plants to become too tender and decay instead of keeping sound when earthed. Guano also is an excellent application. Applications of liquid manure would also be beneficial by causing the plants to push fresh roots, and so outgrow the canker, the iron being neutralised by the ammonia.

Leaves Falling from Peach Trees (W. H.).—The leaves are scorched by sun acting powerfully upon them whilst wet, the water having rested some time on the leaves and weakened their tissues. This sometimes causes so severe a check as to bring off the leaves both on trees under glass and in the open air against walls. There is no disease on the leaves whatever, but they have every indication of gum disease infecting the branches, the leaves becoming blotched and falling in consequence of ill supplies of sap, the gum having closed the alburnous layers of wood. Sometimes the leaves are cast through overcropping or insufficient supplies of water to meet the requirements of the leaves in evaporating under powerful sun; and they are sometimes cast from the thinness of the epidermal tissues, which, unable to sustain evaporation under powerful sun, especially after a dull period, when the foliage becomes thin and soft, are scorched and rendered limp, the leaves, however, not falling until the sap flows freely, and their conduits being closed they are shed. There is some red spider on the leaves, but not much, not sufficient to account for the leaves falling, and some are quite clean.

Names of Fruits.—*Notice.*—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (J. F.).—Two of the fruits were completely spoiled, and one only arrived as sound as when you placed it in the box. We do not, however, undertake the naming of Plums without knowing whether the summer shoots of the varieties are smooth or downy, this being an important feature in leading to identification.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (E. A. P.).—1, Cannot identify; 2, *Campanula urticifolia*; 3, *Ruta graveolens* (Rue); 4, *Campanula urticifolia alba plena*; 5, *Campanula latifolia alba*; 6, *Campanula persicifolia alba*. (J. C.).—1, *Inula Helenium*; 2, *Hieracium aurantiacum*; 3, *Achillea Ptarmica flore-pleno*; 4, *Centaurea macrocephala*; 5, *Lysimachia vulgaris*.

DAIRY REFORMS.

FURTHER consideration of this important subject brings with it the conviction that practical hints will now have especial attention from committees having the matter before them, and who are seeking for information for their guidance in framing measures calculated to prove really useful. Another article may therefore be more to the purpose now than later on. Some repetition of

facts may occur, as our object is to miss no point of importance; minor details are easily worked out when once the guiding principles are understood.

Since separators have come into general use much waste both of butter, building space, and time has been avoided, for they are an admirable embodiment of efficiency and economy. Milk pans, and the space required for them, are now dispensed with, all the storage space required for milk being two cisterns, one for receiving the milk as it is weighed into the factory, the other being for the separated milk as it comes from the separator, both being placed above the dairy, where now milk is positively never seen, except when whole milk is churned as a test of quality. Since Lefeldt's separator was first seen at the International Dairy Show at Hamburg some fourteen years ago many improvements have been made, but the principle is the same in all. It is simply centrifugal force acting upon the different gravities of the component parts of milk. In factories the milk flows from the receiving cistern through a pipe into a cylinder revolving with great rapidity. The lesser gravity of the cream causes it to gather to the centre and run off through a pipe, while the milk as the cream leaves it rushes to the outer sides of the cylinder, whence it passes through a pipe to another cistern. In hand machines the only difference is the pouring in of milk by hand, and the outflowing of the separated milk and cream into pans or milk-pails. The spectacle is positively fascinating; we never can go past a separator at work without pausing to admire this marvellous result of the application of a simple natural law to practice. How is it done? is the question plainly indicated by the puzzled countenance of many a worthy farmer at the dairy shows.

Important as this step onwards of the prompt separation of cream from the milk undoubtedly is, it has another and still greater advantage in its thoroughness. Very many trials have been made of separators and milk pans; one will suffice here. Forty-three experiments were made at a trial in the Munster Dairy School, the averages from a given quantity of milk being 100 lbs. of butter from a Danish separator, 59 lbs. from milk set for twenty-four hours in open pans, 66 lbs. from that set for thirty-six hours, 73 lbs. from the cream obtainable in forty-two hours, and 76 lbs. as the maximum quantity possible from skimming the cream for a period extending to fifty-four hours—a practical impossibility in very hot weather. This reminds us of another fact, which is that the separated milk is quite fresh, and is more valuable than skimmed milk, is a marketable commodity, and meets with a ready sale at a low price as separated milk. In Munster the shareholding farmers take away the separated milk from the creameries for the pigs. At the Glynde factory it is scalded as it comes from the separator in a Lawrence scalding at a temperature of 160°, and is sold to the dealers at 3½d. or 4d. a gallon, they retailing it at 1½d. or 2d. a quart.

The question is frequently raised, How are we to dispose of British butter? That question was answered in general terms last week. Here is something more specific. With an output of 2000 lbs. of butter weekly at Lord Hampden's Glynde factory the prices range from 1s. 6d. per lb. from the beginning of October till the end of March to 1s. 4d. in April and May, and 2d. less during summer, there being no limit to quantity, buyers are willing to take all they can get. For the butter made at Lord Spencer's dairy at Harleston about the same price is obtained, and there is a similar demand for it.

Such landlords' factories are an undoubted boon to tenants, but we are most anxious than tenant farmers should be induced to combine in the establishment of co-operative factories. If technical education can induce them to do so it will have done very much to restore prosperity to agriculture. One of the highest authorities upon the subject has laid it down that, a doing factory in the hands of an ordinary middleman, whose only object is to buy in the cheapest market and sell in the dearest is a source of injury to dairy farmers. Of course it is, and they

must be shown how to do better for themselves. It is notorious how at middlemen's factories the price given for milk is constantly falling; factory profits undoubtedly mount up proportionately. The meek, submissive graziers go on accepting reductions of prices forced upon them, still supplying the milk, grumbling lustily and persistently, but doing positively nothing to improve or alter matters. We know of a shrewd middleman in the midlands who this season sold off all his cows, let his pastures, buys milk for his factories, avoids all risk from losses or sickness of cows, and all expense of keeping cows, simply because he has found he can get all the milk he wants at what is practically his own price.

WORK ON THE HOME FARM.

Wherever steam tackle is available it should be kept going in field after field as crops are cleared. Light two-horse ploughs, easily used by boys, are also brought into use during harvest, at any rate while reaping is being done and the horses are not wanted except for the reaper. Every available hand must now be turned to account to save the corn and clean the land. We urge this upon the attention of our readers because the habit of slovenly practice, of leaving ploughing till winter or spring, is so general that even the few acres of arable land of dairy farms are as badly cultivated as the big fields of corn farms. Without due recognition of the importance of autumn tillage there cannot be clean land; with it weeds are destroyed, soil well stirred and thrown up into ridges for winter, and a deep early seed bed in spring is a certainty. It is only light sandy soil that does not require ridging, all other is the better for it.

Much clay burning has again been done, and a good dressing of it will be given to more of the heavy land deficient in mechanical division. There is nothing better to open up the soil, for promoting free and thorough drain action, and the circulation of air through the soil. That is our reason for burning clay, and we hold that a reason should be forthcoming for everything done on the farm.

Lime fresh from the kiln at the rate of 60 bushels an acre is good for all land at intervals of five or six years, and is of especial value for clays; it, too, divides the soil particles, as well as having a wholesome chemical action on it. We prefer using it in early autumn, placing it about the surface in small heaps; it is soon slaked by absorption of atmospheric moisture, and is at once ploughed in. The tendency of this and all autumn tillage is the opening up, cleaning, and thorough division of soils. Get this well done, and leave fertilisers alone till the time draws near again for spring cropping. It is, of course, understood that winter corn must have the usual dressing of manures, using about a hundredweight per acre of sulphate of ammonia with the minerals for very poor land; but where land is in good heart nitrogenous manure may be withheld till spring, when a timely dressing of nitrate of soda sets the plants growing freely, and goes far to promote a strong growth of straw and the development of full ears of large grain—a heavy crop in the full sense of the term, and we should be satisfied with nothing less.

REMARKS.

- 7th.—Rainy from 2 A.M. to 9 A.M.; generally sunny from 11 A.M. to 1 P.M.; frequent spots of rain after, a slight shower at 3 P.M., and wet evening.
8th.—Cloudy early; bright and sunny till 4 P.M.; occasional spots of rain after 5 P.M.
9th.—Rain early; overcast morning, with occasional spots of rain; a little sun in afternoon, and overcast again in evening.
10th.—Overcast morning, sunny afternoon.
11th.—Fine and generally sunny.
12th.—Bright sunny day; aurora between 9 and 10 P.M.
13th.—Sunny early, generally cloudy after 10 A.M.; slight showers in afternoon; fair evening.

A rather cloudy week, but with no day entirely overcast. Temperature very near the average.—G. J. SYMONS.

NOTES ON SWEET PEAS.

IT would appear that these highly esteemed annuals are this season very deficient in quality owing to the bad harvest of seed last year. In some instances I have heard of, an admixture of the seed of Tares had been added in order to spin out the quantity, and in most cases a larger quantity than usual of the commoner sorts had been used in making up mixtures. This has not been invariably the case, as I do not think I have ever had a choicer collection of mixed sorts, the colours being varied and the individual blooms large and fine. With varieties grown under name I imagine there would be no difficulty in making up bunches of separate sorts to the number of twenty-four, and perhaps even to thirty. Some of these varieties are doubtless of but slight value for decorative purposes, and it may soon become an established practice to select a few by name or colour and to grow these to the exclusion of many of which the value is but slight.

This system may be objected to as entailing an additional expense for flowers which can be had in quantity for a very slight annual outlay, but we have as a set off the quality of floriferousness increased to a great degree in selected sorts in addition to a larger number of blooms on each flower stalk, the blooms, moreover, being greatly increased in size. Then there is no doubt that Sweet Peas are much too thickly sown. The best crops I have are on plants set out a foot apart. These are of the newer kinds, and were started under glass in pots and planted out in late spring. Each was pinched once in order to obtain a bushy plant with four or five main shoots, and there is simply no comparison as to the amount of bloom on them and on older varieties sown in the usual way, though not at all thickly. It may seem somewhat absurd to enter into any detail as to the best method of cultivating this simple easily grown flower, but the ease of its culture is, I am afraid, a serious drawback to securing Sweet Peas at their best. I have already mentioned thick sowing as a detail to be avoided, and I have no hesitation in affirming that thinly sown Peas invariably give the best results as to crop and size of flower, while the period of blooming is extended.

I do not think that a rich soil is conducive to the best results. A more rank growth is no doubt obtained, but that means either taller plants, with longer sticks to cling to, or broken-over growths where the sticks are short. The best form of manure I know for Sweet Peas is soot applied after the seedlings are through the ground. Superphosphate of lime is also very beneficial, but not to the same extent as soot. The way I discovered the merits of this common manurial agent was through the difficulty experienced in keeping pheasants from destroying the young plants—of which they are particularly fond, grubbing the whole crop up if allowed to go on unmolested. On one occasion when time was scarce a very thick coating of soot was sown on the plants. This had at once the desired result in disgusting the pheasants and at the same time securing finer Peas than we had ever seen before. The dressing has since then been annually applied. A mere sprinkling is not of much use; a barrowful is applied to from 30 to 40 yards run, and one dressing is sufficient for the crop.

Another point of much importance is deep sowing. The necessity for this practice is found in the roots being well out of the way of drought. Shallow sown seeds invariably cause a falling off in the plants during a short spell of dry weather, while

deeply sown seed secures the plants against any short vicissitudes of temperature. The practice of drawing soil to the plants previous to staking acts beneficially, because it keeps drought away. Many years ago I began to have all the pods gathered off the plants before they caused a cessation of flowering, which continued podding does. In some years the rows require to be picked over twice; but, as a rule, once is sufficient in our district. This practice insures a supply of good flowers until stopped by frost. The way we employ foliage in which to set up the blooms has also a good effect in securing a continuous bloom; causing, as it does, an unfailing supply of young shoots to be produced from the stems, the tops of which had been removed.

Any remarks on Sweet Peas would be incomplete which made no reference to the strains under name, and which show quite as wonderful a progress as almost any other flower during the past few years. Several good varieties have been before the public for some time, such, for instance, as Princess Beatrice, a soft rosy variety of much beauty. But prettier even than this is Apple Blossom, a flesh coloured sort, not of the largest size of flower, but very lovely in its shade. Countess of Radnor is a meet companion for it, the shade being a French grey or very light blue of the most charming effect. Unfortunately the colour does not appear to be quite fixed, as several shades of blue are found among the plants. Of even greater beauty is Mrs. Eckford, which has a blossom of quite a pale straw colour, almost white indeed. This, I think, is the most beautiful of all Sweet Peas, at the same time many prefer to place Countess of Radnor in that position, and in any case neither can be done without where flowers of the finest quality are desired. The largest variety I know is Her Majesty, a glorious flower in the way of Splendour, to which it is much superior. The colour is a clear light pink. Of a much softer shade, indeed only a little deeper than Princess Beatrice, is Mrs. Gladstone. Few of the sprays on this fine variety carry less than four large blooms each, and occasionally a spray is found with five. The stem is also of good length, and for vase decoration it is a valuable kind.

Of the dark sorts Boreatton has many admirers, but I cannot say I like it so well as many others. For a crimson, perhaps, there is nothing better than Cardinal, which is very bright and glowing. Ignea is in the same way with larger flowers, but I do not know that it is so effective as the other. Of whites both Queen of England and Mrs. Sankey are good; the latter is a variety of very strong growth, a feature which detracts from its usefulness. The stalks are of great length, and the flowers of the clearest white. There is not yet a good blue, so far at least as I have had experience, and a yellow is more than the blue a thing of the future. We have Primrose, which is said to be yellow, but much of the yellow is a delusion. However, we may hope for something better ere long. Mr. Eckford has evidently mastered the problem, and has his Sweet Peas so well in hand that anything he may produce will be received with gratitude, though without surprise.—R. P. BROTHERSTON.

SCHEDULES AND THEIR INTERPRETATION.

ALTHOUGH I had nothing whatever to do with the fruit judging at Trentham, it has often fallen to my lot to share in the adjudication of prizes, and therefore I naturally take an interest in the question of the framing of schedules, and the interpretation of the terms employed in the classes. I have no preferences or prejudices in respect to the Trentham case of disqualification; but regarding it from a judicial point of view, and recognising, as we must recognise, in case of doubt, the intention of committees who prepare schedules for the guidance of exhibitors and judges, I am bound to dissent from some opinions that have been expressed in the *Journal of Horticulture*.

A correspondent ("W. H. M.") states, on page 122, his belief

that Mr. McIndoe was fully justified in exhibiting two Pine Apples as separate dishes in one class, when "one Pine" was specifically named, going on to say "the Judges ought to have fully considered the words in the schedule" before arriving at a decision. Evidently he thinks they did not do this, and they will scarcely thank him for the compliment. In my experience there is no duty more distasteful to a judge than to disqualify an exhibitor, and I have never known it done without giving the most anxious and careful consideration to the terms by which they are guided. Doubtless the Trentham Judges weighed the whole matter with grave deliberation, and that being so they were bound, in my opinion, to decide against the exhibitor. I certainly should have done so, and whoever stages in a similar manner under similar stipulations in future I shall, if an adjudicator, disqualify the collection.

If an exhibitor can stage two Pines as "separate dishes" when one only is specified, why cannot he stage three or four? Please answer that question, "W. H. M.," in as "definite" a manner as you say the terms of schedules should be. If you say he cannot do this you will be in conflict with Mr. McIndoe, who clearly indicates on page 103 that he was fully entitled to do so; in fact, to have staged six Pines. Now suppose he did this in a class of "nine dishes, to include two varieties of Grapes, one black and one white, one Melon, and one Pine," and you staged two dishes of Grapes, one Melon, one Pine, also separate dishes of Peaches, Nectarines, Figs, Cherries, and Plums, do you think you would have been wrong in your strict adherence to the precise terms as stipulated, and he would be right in departing from them to the extent of five Pines? Should you not have objected to being "swamped with Pines?" This is the precise logical result of your argument. It is also Mr. McIndoe's view. He says, on page 103, that after staging the stipulated four dishes he could complete the collection with "whatever kind of fruit he might think proper to use." What does this mean? It means that he could have staged five more dishes of Grapes or five more dishes of Melons, or it means nothing.

The proposition is in direct contravention of the whole spirit and practice of exhibiting fruit. It is exactly to prevent such an absurdity occurring that stipulations are framed similar to those above quoted. They convey the intentions of the Committee with sufficient clearness to practical men. The term "to include" has no such wide meaning as Mr. McIndoe suggests. It simply means that a collection must include the dishes specified, and that nine dishes made up without them would not be eligible for receiving a prize. That is the legitimate meaning according to all precedents in the history of exhibiting. The intention of the Committee is also clear and reasonable—namely, to place all competitors on an equality in respect to four prominent and important dishes, leaving them latitude with the remaining five. In respect to these the terms as published with the report of the Show on page 84, July 28th (I have not a Trentham schedule), are not precise, because the word "distinct" is omitted, and it is this which gives Mr. McIndoe room to say that he could fill them with five varieties of any one kind—five Pines, five Peaches, or any other fruit, but mark this—beyond those which are specified. The stipulated number of those—"two Grapes, one Melon, and one Pine"—can no more be exceeded than could ten dishes be allowed when nine only were named as the limit of the collection. If the word "distinct" is in the schedule the five dishes must be dissimilar from each other and from the four described. If it is not there can be no duplicating of those that it was imperative to include in the number so clearly specified.

Perhaps another correspondent, "W. H. D.," page 146, may now begin to see that the Judges had a basis on which to ground their decision. I may be permitted to doubt if this correspondent has either exhibited or judged many collections of fruit. I should have said that he wrote more like a lawyer than a gardener if he had been a little more cautious. His argument is based on a "presumption," and this a false one—namely, that the specified dishes could be duplicated. He is venturesome, too, in prophesying that ninety-nine out of every hundred exhibitors would interpret the conditions as he did. This is easily put to the test. Did one solitary exhibitor at Trentham, apart from Mr. Indoe, so interpret them? Not one. What, then, becomes of the unanimity? Just this, It is exactly the other way, diametrically opposed to the prophetic utterance and in strict conformity with the schedule, thus proving conclusively that its terms were well understood.

I have known cases of the whole of the exhibitors in a class failing to comply with the terms of a schedule which stipulated for six kinds, and they staged "varieties" under the assumption that they were "kinds." It was a pure mistake, and the collections were judged on their merits. In another case four out of five so erred, and the fifth was accordingly adjudged the first prize, though his produce was comparatively inferior. Had he failed to obtain

a prize he would have very properly entered a protest, and must have sustained his claim as the only exhibitor legally entitled to recognition.

It behoves judges to be extremely careful in doing justice between man and man, also in seeing that the stipulations of schedules are complied with, as laxity in this respect misleads exhibitors, and it would seem that even Mr. McIndoe was misled at Trentham through a mistake of the judges at a Crystal Palace show. But if judges should exercise care so ought exhibitors, while the terms employed in schedules cannot be too precise to prevent misunderstanding, and avoid the most unwelcome of tasks to adjudicators, namely—disqualifying exhibits.—A JUDGE.

SIXTY YEARS OF HORTICULTURAL PROGRESS.

(1760—1820).

(Continued from page 490, last vol.).

AN author, who wrote about London early in the present century, gives a somewhat amusing description of the block that often occurred upon Old London Bridge in the afternoon, and he notes that conspicuous amongst the crowd of vehicles were those of citizens hastening, or wanting to hasten when business was over, to their suburban villas. These suburban villas and their gardens, few of which remain, were very characteristic of the reign of George III., and they illustrated a style of garden arrangement and showed a variety of expedients that seem odd to us, but which formed a step in horticultural progress with all their defects. Another thing noticeable about these citizens' or gentlemen's villas was the employment they gave to gardeners, for in many instances the residents either had a gardener constantly employed (who might also have to act as stableman), or they hired one now and then from some nursery, or had some jobbing man. But a change has taken place, and though our increased population shows no diminution of interest in all branches of horticulture, there is less employment open to gardeners by profession than formerly. At the present time—frequently from economy, but also from love of the pursuit—a large number of persons occupy themselves in their own gardens, and do not engage others to do what may be required, except perhaps for the heaviest work. This has diminished the demand for gardeners.

The garden of the common suburban villa had usually an arrangement of evergreens in front to afford a screen, flower pots intermixed, the back looked out upon a flower garden, beyond which, if space permitted, were fruit trees and shrubs. Many thought it cheaper to buy vegetables than to grow them, but some had a kitchen garden skirting the flower beds and walks, from which it was separated by a hedge or rustic fence. Friendly competitions as to who should have the finest flowers or the earliest vegetables took place amongst these suburban residents, and those who had grounds of sufficient extent used to have what we should call garden parties, which brought flower growers into communication, and they often exchanged seeds, buds and slips. Visitors to London from distant places, by seeing such villa gardens—those of the leading nurserymen and perhaps some of the gardens attached to such mansions as Holland House, Gunnersbury, or Kensington Palace—went to their homes with new ideas, which were afterwards embodied in practice. Intercourse with some of the leading gardeners of London gave a great impetus to Scotch and Irish horticulture at the beginning of this century, for it was a singular fact that though so many Scotchmen who came to the south rose to eminence as gardeners in their native land, before that date there was scarcely a greenhouse or stove to be found of any size, or containing plants worth notice.

A very perceptible defect in many of the flower gardens laid out during the eighteenth century was that they were below the level of the adjacent land. We may see specimens of this old method in some of the London squares yet. This was done with the intention of affording warmth to the plants in the colder months, but it prevented proper drainage, and had not a pleasing effect by any means. Nicol and Loudon recommended the practice of giving a flower garden some elevation, also they advised that within it the surface should not be of one level, but made to wave somewhat. Mason the poet had advised that the whole should be on an incline broken by winding paths; the result was that the higher plants were kept too dry, and the lower were apt to be washed out of the soil. Repton opposed the common practice of planting deciduous shrubs amongst the flower beds for several reasons, and suggested that they should be put along the sides of a garden or on the lawns, but always grouped with evergreens to avoid the appearance of bareness in winter. Abercrombie advocated the round or oval form in the case of small gardens, considering

that straight lines are displeasing to the eye, and on the same principle he disapproved of paths made with angular turns. All gardens of any size, he said, if their shape was regular, should be made to look irregular by having shrubs planted and beds arranged so as to give the idea of extent.

A book entitled the "Florist's Manual," published about 1800 anonymously, but stated to be from the pen of a lady gardener, called attention to a fact which had been scarcely noticed or acted upon—the influence of sunshine upon flowers, and that in many species the date of flowering depends upon the aspect they have afforded them, also the time during which they will continue in bloom. She advised, therefore, that beds should be planned to give the plants a variety of aspects, while for some species it might be advisable to arrange that they should be exposed to the south and east, as being more beneficial than the north and west. This authoress devoted part of her space to the consideration of rock-work, then a novelty, and which had displaced the old-fashioned "knots," which were contrived of earths variously coloured. Early attempts at rockwork were in the direction of piling up large stones in a clumsy fashion, and amongst these many plants were set which in Nature would not be found growing on rocks, but which thrived best on a warm border. One of her suggestions was that bulbous species might be advantageously mixed in beds and borders, so that a succession of different sorts might succeed each other through the summer. Before that it was a usual practice to mass together for show a number of one species, the Tulip for instance, and when they were over the ground looked cheerless the rest of the season. Some gardeners followed for a time another suggestion of hers, that both borders and beds should be so limited in breadth that in working on them every part could be reached without the person having to step upon the mould. But early in this century people were beginning to make the beds larger and more or less rounded. At one time most were narrow, and the principal ones in a garden oblong, though small beds, of all sorts of shapes, were much favoured, especially upon lawns, where, from their being often crowded together, it was necessary to protect them by basket-work of wood or iron. Loudon says that to obtain new figures for beds a kaleidoscope was occasionally employed.

For edgings, Thrift and Box were now displacing the variety of plants that had been tried with more or less success, such as the Daisy, Violet, Periwinkle, Stonecrop, and also the Strawberry, with its runners cut in during summer. What was called the "changeable flower garden," originated by one who had studied the Chinese modes, gardeners found practically inconvenient. By this system the flowers in the beds were changed from time to time, plants being brought for the purpose from a reserve ground as they came into bloom. It was shown by Hogg and Neill that this was not necessary if a sufficiently large number of plants were intermingled in spring, and in arrangement height and colour were kept in mind. Thomas Hogg, who lived at Paddington, was a schoolmaster as well as a gardener, and a successful grower of Pinks, Carnations, Auriculas, and Tulips. The confused method of planting out which had arisen, partly out of a protest against the Dutch artificiality, partly from a natural wish to exhibit the many novelties of last century, gave way to the method of placing plants in rows or circles.

Another great improvement arose when gardeners awoke to the fact that it was of importance to have a good subsoil. This had been deemed of little consequence in the flower garden, where it was not usual to break up the ground as in the kitchen garden. Nicol pointed out that both gravel and clay have disadvantages which do not attach to chalk or loam, and that in making up the beds the character of the subsoil must be considered. He advised that the beds should be occasionally trenched and allowed a period of rest.—J. R. S. C.

CARNATION DR. HOGG.

WHILE the ranks of the Border and Fancy Carnations are annually strengthened by numerous additions, those of the florists' varieties increase but slowly. It is quite natural that such should be the case, for with the latter crossing has been practised for so many years, and by so many skilled florists, that the point of perfection has been very closely approached, and further progress can only be slow; whereas with the former the field has been left comparatively open, and the limits are by no means so nearly reached. Recognising the force of this reflection, it will be readily admitted that in one sense the production of a really superior Bizarre or Flake marks a greater step than the production of a distinct and beautiful Self or Fancy. Hybridisers are, as it were, hemmed in by a circle of high-class varieties, through which it is extremely difficult to break. This may be emphasised in the

important section of Scarlet Bizarres. Here we have a galaxy of brilliant gems, so remarkable for the possession of the many points which go to make up a high-class exhibition flower, that it is not easy to imagine a distinct advance on them, much less to produce it. What improvement is effected is gained at rare intervals. For many years Admiral Curzon ruled the waves of Bizarre-dom, and proved himself to be staunch and true in many a hard-fought struggle; but his star set at the advent of Robert Houlgrave, and the latter may still be said to hold the field, although its position is strongly assailed by two other grand varieties. The first of these, C. H. Herbert, appeared in 1890. It was raised by Messrs. Thomson & Son of Birmingham, and is a flower of great beauty and quality. The second was raised by Mr. Turner of Slough, and exhibited by him at a meeting of the Royal Horticultural Society last year, when it received a first-class certificate. It was named in honour of the head of this Journal. Dr. Hogg, which fig. 23 represents, is a superb variety. It is a large, handsome, well-formed flower, and may be described as a highly coloured Scarlet

FIG. 23.—CARNATION DR. HOGG.

Bizarre, with perfect markings, and a beautifully smooth, shell-shaped petal, very smooth on the edge; the white is also very good. It has a perfect calyx, which has not the slightest tendency to split. It is a most constant flower, and remains fresh for a very long period. Dr. Hogg is a great acquisition to its section, and it may safely be said that in course of time, when more widely spread, it will rank with C. H. Herbert and Robert Houlgrave in general popularity as an exhibition flower.—W. P. W.

ROYAL HORTICULTURAL SOCIETY.

EXHIBITION AND CONFERENCE ON BEGONIAS, FERNS, APRICOTS, AND PLUMS.—AUGUST 23RD AND 24TH.

IN one important respect this fixture of the Royal Horticultural Society was of special interest, for it gave an opportunity of becoming acquainted with species and varieties, both of Begonias and Ferns, which are very rarely to be met with at public exhibitions. Plants and flowers of the best varieties of Tuberosus Begonias that the florists' skill

has produced are seen from time to time; but the old species, from some of which they have taken their rise, are rarely met with. Similarly, many of the best exotic Ferns are frequently on view; but the occasions when a really representative collection of British species and varieties is gathered together are few and far between. With respect to the fruits singled out for special attention, both Apricots and Plums are valuable and popular, and it was unfortunate that owing in great part to the season a representative display of these could not be got together. If there was any disappointment in this respect it must have been amply atoned for by the Begonias and Ferns. The former, both in respect to species and florists' varieties were full of variety and interest, while the Ferns were magnificent. Those contributed from the Clifton Zoological Gardens and Shirenewton Hall collections, with which the well-known name of Mr. E. J. Lowe is associated, were superb, affording in their diversity, beauty of form, and excellence of culture a great lesson, and providing a source of pleasure and instruction to Fern-lovers such as it is not often their good fortune to meet with. It is true that to the general public knowing nothing about Ferns the numberless varieties and sub-varieties may be confusing rather than instructive. They are certainly multiplied to an almost alarming extent; but to those who have familiarised themselves with the types the study of the different varieties is full of interest. Even the apparently formidable barrier of the nomenclature may be mastered, though the uninitiated may be forgiven if they look with something approaching alarm on a plant owning five or six names.

In addition to Mr. Lowe's magnificent contribution, which quite dwarfed the others in its magnitude, Mr. C. T. Druery contributed lavishly from his rich stores, exhibiting abundance of choice forms, while Mr. Wm. Marshall, Mr. H. B. May, and Messrs. W. & J. Birkenhead also showed splendid material. Fern lovers, and indeed the public generally, owe a debt of gratitude to these well-known amateur and trade growers for their displays; many must have wished that such an exhibition could become an annual fixture at Chiswick. Particulars of the principal exhibits are appended.

THE FERNS.

Special prizes were offered for varieties and species of British Ferns, divided into sections according to their character, and amongst these plants were many beautiful forms. The first prize, for ten plumose varieties, was awarded to the collection from the Clifton Zoological Gardens and Shirenewton Hall collections (Mr. E. J. Lowe). These were superb plants. Very noticeable were *Polystichum angulare divisilobum robustum*, a very beautiful form; *P. a. plumosum augustum*, *P. a. inaccessum*, *P. a. bellatulum*, and a grand plant of *Athyrium filix-fœmina plumosum Molyi*. From the same collection came the first prize ten cruciate or narrow varieties, amongst which were *Athyrium f.-f. notabile*, *A. f.-f. cruciferum*, *A. f.-f. ornare*, *A. f.-f. Irene*, *Polystichum angulare Hydra*, *P. a. cruciatum ornandum*, and *P. aculeatum graminoides*, hybrid. Another beautiful group was shown from the same collection in class C, ten varieties of *Athyrium filix-fœmina*. Amongst these were *Arthuri*, *Excellentia*, *decoratum*, *ornamentissimum*, *Stella*, *intercisum*, *prominens*, and *exornatum*. Mr. Lowe won again with hybrids and varieties of *Polystichum aculeatum*, *capitatum*, *plumosocruciatum*, *pulcherrimum*, *pendens*, *abbottia*, *gratum*, *polydactylum*, *meritum*, and *honorabile* being shown. Yet another victory was gained by him in the class for sixteen varieties. In these the plants were alike remarkable for excellence of variety and culture. *Lastrea filix-mas Padleyi* was a superb plant, nearly 5 feet through, and other grand specimens were *Polystichum angulare centiceps*, *Athyrium filix-fœmina bellatulum*, *P. angulare attractum*, *A. f.-f. crucipennulum*, *Scolopendrium vulgare crispum Kitsonæ*, and *P. a. fascinum*.

The competition for eight varieties produced the same result, Mr. Lowe being easily first. He had *Lastrea filix-mas maritum*, *S. v. crispum fertile*, *A. f.-f. augustum*, and *Polystichum angulare revolvens* in fine condition. Mr. Lowe won again with eight varieties of *Nephrodium* (*Lastrea*) *filix-mas*, which included *abbreviatum*, *gracile*, *crispum*, *paleraceum ovatum*, *p. depauperatum*, *Ellacombei*, and others. A very beautiful group was Mr. Lowe's first prize ten varieties of *Scolopendrium vulgare*, *deleserioides*, *sagittatum grandescens*, *capitellum*, *crispum saccinum*, *marginatum corollarium*, *camulare*, *sagittatum Jonesi*, *crispum pendens* (a form of *robustum* found in Monmouthshire), *jubatum*, and *crispum Willsi*. They were splendidly grown plants. Hardly less noteworthy were the eight varieties of *Polystichum angulare* from him, which consisted of *stipitatum*, *innocuum*, *insignitum*, *latifolium coronare*, *longipinnulum*, *coronum*, *acutilobum fascians*, and *flabellipinnulum*. They were, of course, placed first. The same result had to be recorded in the class for eight crested varieties, and somewhat similar remarks apply, for all were splendid plants. The varieties were *Athyrium filix-fœmina unicum cristatum*, *Polystichum angulare decorandum*, *Scolopendrium vulgare promesitum*, *S. v. accumulare*, *Lastrea paleracea bicornis*, *L. abbreviata cristata*, *P. a. divisilobum cristatum*, and *P. a. galeatum*. For four varieties of Ferns Mr. Lowe won with *Adiantum Capillus-Veneris Lucasi*, *A. C.-v. Lowæ*, *Osmunda regalis cristata* and *Lastrea spinulosa cristata* of Jones. He was only second with four varieties of *Polypodium vulgare*, but won again with four *Adiantums*, the varieties being *Capillus Veneris beatum*, *C. v. dentatum*, *C. v. augustum*, and *C. v. autumnale*. He was also first with eight rugose or muricate varieties, showing *Scolopendrium vulgare muricatum subcrispum*, *S. v. muricato-undulatum*, *S. v. bimarginatum Lyelli*, *S. v. muricatum maritum*, and others. For ten varieties of *Asplenium* he continued a remarkable

series of victories with *A. trichomanes triangulare*, *A. ceterach multifidocristatum*, *A. t. incisum O'Kellyi*, *A. C. muricatum*, and others. Mr. Lowe was again first for sixteen dwarf varieties, having *Scolopendrium vulgare corollarium*, *S. v. corolla*, *S. v. muricatum-reflexum*, *S. v. blandissimum*, *A. f.-f. minimissimum cristatum*, and others.

The first prize for four varieties of *Polypodium vulgare* varieties went to W. Marshall, Esq., Auchinraith, Bexley, who exhibited good plants of *cornubiense semi-lacerum*, *cambricum Prestoni*, and *trichominoides*; he was second with four varieties of Ferns. Mr. C. T. Druery also exhibited many good plants and varieties; he was second with sixteen varieties, any species; he had the best variety of *Scolopendrium vulgare*—namely, *cornutum radiosorum*, and also the best variety of *Athyrium filix-fœmina*, *plumosum Drueryi*. Mr. Marshall received the first prize for the best *Polypodium vulgare* with a beautiful plant of *trichominoides*, and this was also awarded the first prize as the best specimen in the Show. Mr. Lowe was first for the best plant of *Polystichum vulgare* with *inaccessum*, an exquisite form; he also had the best *Nephrodium*, this being the *filix-mas Padleyi* before referred to. The first prize *Osmunda* appeared to be his *regalis cristata*, and the first prize *Adiantum Capillus Veneris beatum*, but the cards did not make this quite clear, and in one or two other cases it was somewhat difficult to follow the decisions, so that an occasional error may have crept in; he had the best *Asplenium* also, this being *Ceterach multifidocristatum*.

Amongst the miscellaneous contributions of Ferns there were several exhibits of much interest. Mr. H. B. May, Edmonton, had a group of small plants, comprising *Athyrium filix-fœmina Howardiæ*, *Lastrea filix-mas linearis*, *L. f.-m. polydactyla*, *A. f.-f. pulcherrimum*, *A. f.-f. superbum*, *A. f.-f. plumosum*, *A. f.-f. Cousinsi plumosum*, *Nephrolepis davalliodes var. multiceps*, *Adiantum elegantissimum*, *Pteris tremula variegata*, *P. Reginae*, *P. Reginae var. cristata*, and many others. A silver-gilt Banksian medal was recommended. W. Roupell, Esq., Roupell Park, contributed a group of *Polystichums*, healthy plants, and many of very large dimensions. Messrs. W. & J. Birkenhead, Sale, Manchester, had a magnificent miscellaneous group, worthy of their reputation, both in its extent, variety, and interest. Amongst the species and varieties represented were *Athyrium setigerum var. Victoriae*, *A. Girdlestoni var. grandiceps*, *A. f.-f. Frizellæ coronare*, *A. f.-f. gracile*, *A. f.-f. curtum multifidum*, *Osmunda regalis cristata*, *A. f.-f. Grantiæ*, *A. f.-f. crispum*, *Polypodium cristatum*, *A. f.-f. conglomeratum*, *A. f.-f. Frizellæ ramo-cristatum*, *Asplenium lanceolatum microdon*, *Asplenium Trichomanes conflurus*, *Osmunda Claytoniana*, *Struthiopteris pennsylvanica*, *Polystichum Browni*, *P. munitum*, *Aspidium nevadense*, *Phegopteris hexagonoptera*, *Asplenium thelypteroides*, *Polystichum angulare Pateyi*, *P. a. plumosum Moly*, *P. aculeatum pulcherrimum*, *Blechnum s. contractum*, *B. s. Mainderi*, *B. s. apiculatum*, *B. s. Aitkenianum*, *B. s. multifidum*, *B. s. crispum*, *B. s. serratum*, *Airey's No. 2*, *B. s. lineare*, *B. s. concinnum*, *B. s. imbricatum erectum*, *B. s. trinervo-coronans*, *Polystichum angulare divisilobum*, *P. a. divisilobum densum*, *P. a. venustum cristatum*, *P. a. imbricatum*, *Jones*, *P. a. divisilobum plumosum*, *P. a. d. decorum*, *Lastrea dilatata crispa*, *L. montana congesta*, *L. f.-m. polydactyla*, *Mills*; *L. f.-m. polydactyla*, *Dadds*; *A. f.-f. Elworthi*, *Lastrea propinqua cristata Barnesi*, *Scolopendrium vulgare grandiceps*, *S. v. kerotoides*, *S. v. crispum robustum*, *S. capitatum*, *S. v. cochleatum multifidum*, and *S. v. crispum fimbriatum*, *Cropper*. A silver-gilt Flora medal was awarded.

A group of considerable interest came from the Clifton Zoological Gardens and the Shirenewton Hall collection. They represented various results of multiple parentage by Mr. E. J. Lowe. For example, two plants were exhibited out of three produced by crossing six varieties of *Athyrium filix-fœmina* together, and one of the prothalli divided into three, the three plants being exactly alike, and in portions of the front showing the characters of all the parents. Examples of *Scolopendrium crosses* were also shown; for example, *undulatum* crossed with *muricatum* and *sagittatum*; *crispum* crossed with *Victoriae* and *muricatum*; *undulatum* crossed with *Victoriae*, *spirale*, and *muricatum*—i.e., a wavy form crossed with a crested, a spiral and a rugose variety. These were inspected with much interest by Fern lovers.

Many first-class certificates were awarded, and the plants thus honoured are referred to below.

FRUIT COMMITTEE.—Present: P. Crowley, Esq. (in the chair), with Messrs. J. Cheal, H. Balderson, F. Q. Lane, J. Smith, W. Warren, T. J. Saltmarsh, J. Willard, J. Hudson, G. Reynolds, A. Dean, G. W. Cummins, G. Sage, W. Bates, and J. Wright.

W. Roupell, Esq., Harvey Lodge, Roupell Park, S.W., sent a collection of Grapes grown in pots, and not commonly seen, but highly flavoured varieties—*Primavis Frontignan*, very rich and pleasant; *Grizzly Frontignan*, also rich; *Purple Constantia*, small, sub-acid; *Dr. Hogg*, not quite ripe, excellent; *Diamond Traube*, round, white, juicy, and sweet, recommended as a good Grape for invalids, being so juicy and refreshing. It was certificated last year (cultural commendation). Mr. Roupell also sent a fine dish of *Lady Sudeley Apples*, very attractive and of good quality, evidently a good late summer Apple (vote of thanks). Mr. Bunyard also showed very fine samples of *Lady Sudeley*, and was accorded a vote of thanks.

Mr. W. C. Leach sent from the Duke of Northumberland's garden at Albury Park a fruiting branch of *Bradley's King Damson* (vote of thanks). Mr. John King, Bandon Hill, Croydon, sent a cluster of *Victoria Plums*, as representative of his crop, which must be enormous

(vote of thanks). Mr. John Watkins, Pomona Farm, Withington, Hereford, sent upwards of forty varieties of Plums; one called Midsummer "Damson" was considered to be a small Plum of no particular merit. Some of the larger Plums were very good, especially Oullins Golden and Kirke's, the whole being representative of the produce of orchard trees (vote of thanks). Messrs. H. Lane & Sons, Berkhamstead, sent a collection of Plums on branches showing the crop—a remarkable one—and the fruits also very fine, especially The Sultan, Belle de Louvain, Prince of Wales, Cox's Emperor, Belgian Purple, and Jefferson. A small silver medal was recommended.

Messrs. Collins, Sons, & Gabriel, Hampton, Middlesex, sent a box of their new Tomato Challenger; also two plants for showing its productiveness. The fruit is medium size, smooth, uniform, globular, bright red in colour, and of good quality. As it was thought to be alike suitable for home use and market, a first-class certificate was awarded.

Mr. Barron placed on the table large dark fruits of the Black Douro Fig, also a fruiting branch showing the great productiveness of the variety. It was received from Mr. Tait, Oporto. The fruits are above medium size, purplish, good, but not particularly rich. It was thought to be a very useful variety, and a first-class certificate was awarded. Fruits of Nebian were also placed on the table, and were of very high quality. This was certificated at the last meeting. A bunch of the Hungarian Grape Voluvna grown in the gardens was placed before the Committee. This variety somewhat resembles Foster's Seedling, but is decidedly richer. Another Hungarian variety, Oreg Tardovany, resembles Mrs. Pearson, and was very juicy, but not quite ripe, and will be examined again. A cultural commendation was granted for a beautiful collection of Apples grown in pots under glass in the Society's gardens. The varieties comprised Ribston Pippin, Cellini, Ecklinville, Yorkshire Beauty, The Queen, Worcester Pearmain, and Lady Sudeley. All were of full size and wax-like in appearance, the last named being very beautiful.

Mr. J. Gibson, The Oaks, Carshalton, Surrey, sent half a dozen specimens of Student Parsnips 3 feet long (vote of thanks); also some enormous bulbs of Sutton's Al Onion, nearly 18 inches in circumference, from seed sown in February (cultural commendation).

Prizes were offered for three dishes of Apricots, but there were only two exhibitors. Mr. J. Miller, gardener to Lord Foley, Ruxley Lodge, Esher, was first with good dishes of Kaisha, Hemskerk, and Moorpark, Mr. Wythes following with Large Early, Shipley's and Moorpark.

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair); Messrs. Charles T. Drucry, H. Turner, G. Paul, W. C. Leach, R. Dean, J. Laing, B. Wynne, G. Phippen, and H. Herbst.

Messrs. H. Cannell & Sons, Swanley, sent a splendid collection of Cactus Dahlias. The flowers were fresh, notwithstanding the heat of the day, and bright in colour. Amongst other noticeable varieties were Duke of Clarence (rich maroon crimson), Minor Hoste (dark maroon), Kentish Sun (very bright scarlet), Robert Cannell (magenta, very pretty), and Pride of Swanley, petals white, heavily blotched with bright rose pink. The whole made a most imposing display.

In another tent Messrs. Cannell & Sons had a beautiful, extensive, and interesting display of double Tuberous Begonia blooms. These were set up in triplets with Maidenhair Fern and sprays of Asparagus. The blooms were very fine and varied in type. Some were similar to Hollyhocks in shape, others closely resembled well-grown Tea Rose buds, whilst others showed a similarity to large double Petunias. It is not surprising that this exhibit attracted attention. A row of small Palms and Rex Begonias at the back added interest and effect to the group, whilst in close proximity a small collection of fibrous-rooted winter-flowering Begonias, likewise shown by Messrs. Cannell, was particularly interesting. Among the varieties, Mrs. Falconer is a beautiful rich yellow, and R. B. Parson is a splendid flower, bright pink in colour. Lady Osborne is a charming pink, whilst Rosebud, appropriately named, always excites admiration. Mrs. Lynch is a charming pink flower with fimbriated edges, and E. Wynne is a pure white, well worth growing. A silver-gilt medal was recommended.

Messrs. J. Laing & Sons, Forest Hill, also had a splendid collection of Tuberous Begonias in pots, as well as cut blooms. The flowers of these were exceedingly fine and made a bright display. Among other varieties Earl Cranbrook, Lady Gertrude, Lord Esher, Picotee, Old Gold, and Marchioness of Headfort were conspicuous. This firm likewise had a collection of ornamental-leaved and winter-flowering Begonias. Among the former were Arthur Malet (dark bronze, very fine), Madame Lebocq, a light coloured leaved kind with dark blotches; manicata aurea, a yellow leaved variety; and Bertha McGregor, a beautiful variety with attractive foliage, the latter being adjudged an award of merit. Bouquets and sprays composed of white and coloured Tuberous Begonia blooms were also shown by Messrs. Laing & Son, these making a charming display. Silver-gilt Flora medal.

An extensive collection of ornamental foliage and winter-flowering Begonias also came from the Royal Gardens, Kew. These occupied considerable space and were of an interesting character, inasmuch as they comprised numerous species. Three plants of Begonia Haageana in this collection were very fine, and the varieties of B. semperflorens were well represented. Other noteworthy kinds were B. M. Handy, a dark leaved variety; B. caffra, and erythrophylla. Messrs. Veitch and Sons, Royal Exotic Nursery, Chelsea, likewise sent a collection of ornamental foliage and winter-flowering Begonias. Among the former, Marie Louise (first-class certificate), is an extremely pretty variety, and

the same may be said of a hybrid between B. socotrana and Rex. A garden variety named Novelty was also attractive, although but a small plant was shown. The leaves of this are of a bronzy colour covered with grey spots, whilst the flowers are pink and drooping in habit. A silver Flora medal was recommended.

There were not many entries in the competition classes for Begonias. Mr. W. Marshall secured the first prize for six ornamental foliage kinds, showing Desfontaine, Van der Hecke, Brongniart, Louis Chrétien, Perle de Paris, and Madame Alamangy, the latter being awarded a first-class certificate. Mr. O. T. Hodges, Chislehurst, was first with nine Tuberous Begonias, showing well flowered plants.

A remarkably fine collection of Cape Pelargoniums came from Mr. Hudson, Gunnersbury Park Gardens. The plants were exceedingly well grown, many of them being 4 feet in height, and nearly as much in diameter. Mr. Hudson also showed a splendid plant of Asparagus deflexus in a basket, for which a first-class certificate was awarded. A new dwarf Pompon Dahlia, named Crawley Bedder, was sent by Messrs. J. Cheal & Sons, Crawley, but it did not appear to be specially recognised. Mr. McMillan, gardener to J. Currie, Esq., Trinity Cottage, Edinburgh, staged a collection of early-flowering Chrysanthemums. The flowers were clean, fresh, and, considering the season, very large. The most conspicuous varieties were Edwin Molyneux, Madame Leroy, Mrs. Irwin Clark, Puritan, Madame Desgranges, and Stanstead White. Miss Debenham, St. Peters, St. Albans, also showed a number of Chrysanthemum blooms grown in the open air, these flowers being attractive although small.

Mr. G. Reynolds, gardener to Leopold de Rothschild, Esq., showed plants of a fringed Carnation named Mrs. Leopold de Rothschild. This is a bright pink flower, and an award of merit was adjudged. A collection of Antirrhinums and Pentstemons was staged by Mr. Wythes, Syon House Gardens, Brentford, and a vote of thanks was accorded. Mr. Leach, Albury Park Gardens, showed branches of Tilia platyphylla, for which a first-class certificate was awarded.

Messrs. Kelway & Sons, Langport, staged a large collection of Gladioli, Gaillardias and other hardy flowers, the whole making a most imposing display. A silver-gilt medal was recommended. The Gladioli were particularly fine, three being adjudged awards of merit. These are described below. Mr. T. S. Ware staged a collection of Hollyhocks, Phloxes, Cannas, and other hardy flowers, amongst the latter being Helenium grandicephalum striatum. A first-class certificate was awarded to this variety, and a silver medal was recommended for the whole exhibit. Messrs. Pitcher & Manda, Hextable, Kent, staged a small collection of cut hardy flowers (bronze Flora medal). A collection of cut Roses and Phloxes, staged by Messrs. G. Paul & Son, The Old Nurseries, Cheshunt, made a good display (silver Flora medal). The Roses were bright and fresh, as also were the Phloxes. Conspicuous among the latter were Eclairer (award of merit), Claudot, Iris, Mars, Granville, and Michael Servantes (award of merit). A number of Begonias came from the Botanic Gardens, Cambridge.

Very few Orchids were shown. C. E. Goodheart, Esq., exhibited a freely flowered plant of Cattleya gigas Sanderiana. Messrs. Pitcher and Manda sent Cypripedium magniflorum and C. Wallaertiana pallidum. Baron Schröder, The Dell, Egham, received a first-class certificate for a hybrid Cattleya, which is referred to below.

CERTIFICATES AND AWARDS.

These were extremely numerous, and space can only be found for brief descriptions of the plants honoured.

Scolopendrium vulgare muricatum reflexum (Lowe).—A dense, compact form, deep green. The varietal names sufficiently indicate its distinct characters (first-class certificate).

Scolopendrium vulgare corolla (Lowe).—A dwarf variety, about 6 inches high, very dense in growth and rich deep green (first-class certificate).

Polystichum angulare inaccensum (Lowe).—An extremely beautiful variety, the pinnæ closely overlapping each other, so as to give a Selaginella-like appearance (first-class certificate).

Polystichum angulare plumosum angustum (Lowe).—A noble plumed variety with graceful fronds of a deep sea-green (first-class certificate).

Polystichum angulare Rheapinna (Lowe).—A variety with graceful fronds and close dark green pinnæ, extremely handsome (first-class certificate).

Polystichum angulare divisilobum robustum (Lowe).—A beautiful plumose variety, with finely cut pinnules, bright green (first-class certificate).

Polystichum aculeatum honorabile × (Lowe).—A remarkably handsome species of upright growth, and with the pinnæ somewhat incurved (first-class certificate).

Polystichum angulare attractum (Lowe).—A graceful variety with long fronds, the pinnæ closely alternate, the pinnulets sharply pointed (first-class certificate).

Scolopendrium vulgare crispum pendens (Lowe).—A magnificent Hart's Tongue with crisped fronds, reflexed and drooping, dense and compact in growth (first-class certificate).

Polystichum angulare longipinnulum (Lowe).—A graceful variety, the pinnules long and very closely set, bright green (first-class certificate).

Asplenium Ceterach ampliandum × (Lowe).—A distinct hybrid, A. Ceterach × A. C. ampliandum, with rounded pinnæ (first-class certificate).

Pteris serrulata cristata pendens (Lowe).—A very distinct and graceful form, with long pendent crested fronds (first-class certificate).

Athyrium f.-f. setigerum Victoriae (Birkenhead).—A cross with narrow pointed pinnae, very distinct (award of merit).

Nephrolepis davallioides var. *multiceps* (May).—A graceful variety with forked pinnae, light green (first-class certificate).

Pteris Regina (May).—A variegated species in the way of *P. Victoriae*, but with a lighter edge, and generally brighter in colour (first-class certificate).

Pteris Reginae var. *cristata* (May).—A crested form of *Reginae*, in this respect quite distinct, and undeniably beautiful (first-class certificate).

Pteris tremula variegata (May).—A very distinct and beautiful variegated variety that should become popular (first-class certificate).

Adiantum elegantissimum (May).—A loose growing graceful feathery form (award of merit).

Athyrium filix-femina superbum percristatum (Druery).—A very beautiful variety with laciniated pinnules, giving it a soft and fleecy appearance (first-class certificate).

Athyrium filix-femina rotundato-cristatum (Druery).—A very distinct variety with crested pinnae, and roundish oblong toothed pinnules (first-class certificate).

Laelio-Cattleya Baroness Schröder (Baron Schröder, Egham).—This is a hybrid between *Cattleya Trianae* and *Laelia Jonghiana*. The sepals and petals are blush, deeply veined with rosy carmine. The lip is frilled, and is of the same colour as the sepals on the edge, paler as the throat is approached, and deep buff in the throat (first-class certificate).

Begonia Madame Alamangy (Mr. W. Marshall).—An exceedingly attractive ornamental leaved variety. The leaves are medium size, silvery grey colour with bronzy green centres, and margined similarly (first-class certificate).

Carnation Mrs. Leopold de Rothschild (Mr. Reynolds).—A fringed variety of a bright pink colour, and sweetly scented (award of merit).

Begonia Bertha McGregor (Messrs. J. Laing & Son).—A useful decorative variety with serrulated leaves, silver-grey and bronzy-green in colour. The under sides of the foliage are green with red ribs, the stems also being red and hairy (award of merit).

Begonia Picotee (Laing & Son).—An edged variety that has been described previously (award of merit).

Begonia Lord Esher (Laing & Son).—A beautiful double variety, with large bright scarlet blooms (award of merit).

Begonia Lady Gertrude (Laing & Son).—A splendid variety when fully expanded. Flowers large, very double delicate pink with white centre (award of merit).

Begonia Earl Cranbrook (Laing & Son).—A grand double variety, rich scarlet (award of merit).

Tilia platyphylla (Mr. W. C. Leach).—This is a very fine Lime, the branches shown having leaves fully 9 inches in length and 6 in width (first-class certificate).

Asparagus deflexus (Mr. J. Hudson).—A beautiful basket of this fine species was shown. It is a slender, drooping species (first-class certificate).

Coleus Distinction (Mr. J. A. Morris).—A very distinct variety of a shrubby character, the leaves and stems being nearly as dark as *Perilla nankinensis* (award of merit).

Gladiolus Mr. Hobborne (Messrs. Kelway & Sons).—A flower of gigantic proportions, salmon pink colour, with a purplish magenta blotch in the throat (award of merit).

Gladiolus Mrs. McAlister (Kelway & Son).—An attractive flower of a lemon yellow colour with magenta stripes in the throat (award of merit).

Helenium grandicephalum striatum (T. S. Ware).—An exceedingly attractive variety with flowers about 2 inches in diameter. The disc is maroon and golden, the petals rich red striated with yellow (first-class certificate).

Phlox Bacoile (Messrs. G. Paul & Son).—A large flower, purplish magenta in colour, and produced in fine trusses (award of merit).

Phlox Eclairer (G. Paul & Son).—An attractive variety with large trusses of rich magenta flowers, light coloured at the base of the petals (award of merit).

Phlox Michael Servantes (G. Paul & Son).—A white variety with a bright rose pink centre (award of merit).

Phlox Le Soleil (G. Paul & Son).—A bright rose pink variety, the base of the petals being lighter in colour than the other portions (award of merit).

Gladiolus Private Secretary (Kelway & Sons).—A beautiful variety with rose shaded carmine flowers, very distinct yellow lip (award of merit).

Begonia multiflora L'Avenir (Vilmorin).—A dwarf growing tuberous variety with small bright red double flowers. An attractive bedding sort (award of merit).

Begonia Louis Robert (Vilmorin).—A compact tuberous rooted variety bearing flattish blush pink semi-double flowers (award of merit).

Begonia semperflorens var. *Princess Beatrice* (Sutton & Sons).—This variety was growing in a bed in the gardens of the Society at Chiswick. It has a dwarf, spreading habit, and bears rather small, blush pink flowers, similar in shape to the type (award of merit).

Begonia Madame Louis Urban (Vilmorin).—A dwarf variety, producing trusses of small rose pink blooms (award of merit).

Begonia rosea multiflora.—A dwarf, free flowering variety, suitable for bedding. Flowers small, double and light pink in colour (award of merit).

Tomato Challenger (Collins & Gabriel).—Fruit of medium size, smooth, uniform, globular, bright red in colour, of good quality, and a heavy cropper (first-class certificate).

Fig Black Duro (R.H.S. Gardens).—Fruit above medium size, purplish, good, but not particularly rich; very productive (first-class certificate).

THE BEGONIA CONFERENCE.

There was but a moderate attendance at the Begonia Conference, which was held in connection with the above Exhibition on Tuesday, Aug. 23rd. The chair was occupied by Mr. H. J. Veitch, F.L.S. Although comparatively small the audience was most attentive, and obviously appreciated the excellent lectures delivered. The Chairman opened the proceedings with an admirable address. His remarks on fertilisation were most interesting, the subject being dealt with at some length. Among other things Mr. Veitch remarked that the object of hybridisers was to obtain a race of sturdy plants capable of withstanding the climate of this country. In this respect they had been fairly successful. Difficulties, however, were not uncommon. The recently introduced varieties, John Heal and Winter Gem for example, had as yet produced no female flowers, whilst in the variety *Adonis* female blooms predominated. Regarding the number of species of Begonias Mr. Veitch observed that there were no less than 350 kinds known to science, but probably of these not more than 150 species were cultivated, and this number only in botanical gardens. Notwithstanding this there was a wide field open to hybridists, and he hoped that even better results would be obtained. As to the geographical distribution of Begonias, it was a notable fact that not one came from Australia, and only about a dozen from Africa. The first tuberous Begonia cultivated in this country came from Peru in 1845, and it was a species of which hybridisers should not lose sight. Mr. Veitch also dealt with the history of Begonias generally in an interesting manner.

Mr. W. Watson of the Royal Gardens, Kew, a well-known successful hybridiser, gave a descriptive account of "Cultivated Species of Begonias," illustrating his remarks with figures and plants of the kinds mentioned by him. Mr. Watson's lecture was brief and to the point; he obviously purposely avoiding as many technicalities as possible, which are apt to prove tedious to an audience.

Mr. J. Laing of Forest Hill next discoursed upon "Tuberous Begonias," and being a recognised authority his remarks were listened to with much interest. After referring to the historical portion of his subject Mr. Laing remarked that he commenced hybridising Begonias in 1875. The following year the results were not very noteworthy, but in January, 1878, he sowed seeds of sorts which he had very carefully fertilised. The results of that sowing far exceeded his expectations, inasmuch as he was that year awarded a gold medal for his Begonias, and many first-class certificates for named varieties. Encouraged by this he secured the varieties *Queen of Whites* and *Henderson's White Queen*, and the second season from that date effected no less than 161 crosses. In fertilising the best types only were used, size, shape, and colour of the flowers, as well as habit of the plants being the aim of the hybridiser. Double varieties were much more difficult to obtain, the pollen being less plentiful than in the single kinds. Mr. Laing went on to say that his varieties of to-day showed a marked improvement upon those of previous years. Hitherto the flowers always drooped; now the majority of them were erect. Those, too, that obtained first-class certificates five years ago would not now merit attention. As to the uses of Tuberous Begonias the double varieties were best adapted for pot culture for the embellishment of conservatories, whilst the single kinds were, and should be, extensively used for summer bedding. Rain or shine they were always attractive, flowering continuously throughout the summer. For bedding purposes one-year-old seedlings were the best, and these should be raised early in the spring.

In his nursery the seed was sown early in January, as the seedlings were not only thus stronger by bedding out time but were not so liable to damp off, as they are apt to do later in the year. The seed was sown in shallow pans and placed in a temperature of 65° or 70°, and when large enough were pricked out into other pans and grown in a similar temperature until the middle of May, when they were hardened off and planted on the second week in June. According to his experience the tubers degenerated after they were four years old, hence it was important to keep up a stock of successional young plants.

Mr. H. Cannell was to have given a paper on "Winter-flowering Tuberous Begonias," but as this will be published with others in the Society's journal, it was decided not to read it at the Conference. Mr. Cannell, however, gave a brief lecture, remarking that it was as essential to have Begonias at midwinter as in the summer. The winter flowering kinds, he said, were as easy to grow as Zonal Pelargoniums, and succeeded well in soil that suited the last mentioned class of plants. Cuttings of the fibrous-rooted kinds should be inserted about midsummer, and then the plants were in excellent condition for flowering during the winter. The paper on "Rex Begonias," by Mons. Bleu, was taken as read.

Dr. Masters proposed a vote of thanks to the lecturers, which concluded the afternoon's proceedings. On Wednesday a Conference on Apricots and Plums was held; Dr. Hogg presided, and papers by Mons. Jamain, Mr. T. Francis Rivers, and Mr. J. Smith were read. The proceedings will be referred to in our next issue.

EVENTS OF THE WEEK.—There are several important Shows to be held during the ensuing week. To-day (Thursday, August 25th) there are Exhibitions at Newcastle, Droitwich, Kenilworth, and Leighton Buzzard, the first being continued on Friday, and Kenilworth on Friday and Saturday. On Friday, August 26th, Sandy Show takes place, also the great Exhibition of Fruit at the International Horticultural Exhibition, Earl's Court, this being continued on Saturday. A gardeners' dinner will be held in connection with the latter at 5 P.M. on Friday. On Saturday, August 27th, the Mosley and District Paxton Society's Show will be held, and on Monday, the 29th, Cresswell Exhibition takes place. On Tuesday and Wednesday, August 30th and 31st, the Brighton and Sussex New Horticultural Society will hold a Show at Brighton, and on the 31st an Exhibition will be held at Eastbourne. On Thursday, September 1st, the Royal Oxfordshire Autumn Show takes place at Oxford.

— **THE WEATHER IN LONDON.**—The rain prognosticated in our last note quickly came, and towards the end of last week there were several heavy downfalls, which, although somewhat retarding harvesting operations, doubtless proved beneficial to pasture. The 21st, 22nd, and 23rd proved to be very hot and sunny; but there were sharp showers towards the close of Tuesday. At the time of going to press the barometer, which had showed a slight depression for a day or two previously, is steady. The weather is close and warm though somewhat cloudy, and the wind is westerly.

— **MESSRS. F. MILLER & Co.,** 267, Fulham Road, London, S.W., inform us that their tender has been accepted for the supply of bulbs (Hyacinths, Tulips, Crocus, Narcissus, &c., &c.) for planting in all the London parks, squares, and gardens of the London County Council. They also state that both Lincolnshire and Dutch grown bulbs are better this season than they have been for the last few years.

— **AUSTRALIAN PLANTS AT THE WORLD'S FAIR.**—The World's Fair Commission of New South Wales has decided to send to Chicago for exhibition in the horticultural department of the Exposition the following typical representatives of Australian vegetation and flora:—Tree Ferns, Staghorn Ferns, Birdsnest Ferns, Todea, Macrozamia of two distinct kinds, gigantic Lilies, Rock Lilies, and Grass Trees.

— **HEAVY CURRANT CROPS.**—If Mr. Bowman (page 146), had stated the size of his bushes, no doubt many readers, like myself, could better judge whether his crops were extraordinary or not. We have had very heavy crops of Raby Castle and Red Dutch Currants, but did not weigh the crop of a single tree; although I was rather surprised one day when I found so many left after the woman had gathered 12 lbs., and this on a medium-sized bush.—A. J. L.

— **THE WELSH POPPY.**—I find the flowers of this Poppy last much longer when the plants are growing somewhat in the shade than when they are in the sun; indeed, they are the first to flower, and certainly the last. Planted on a rockery where some shade is obtained this Poppy really becomes a nuisance if strict attention is not paid to pulling up promptly the seedlings not required. The early flowers are useful, but are little thought of when those of the Iceland variety come in a little later on.—E. M.

— **BOUVARDIAS AS BEDDING PLANTS.**—It is very seldom that Bouvardias are used as bedding plants, but with very little trouble they may be employed with fine effect. Among the many fine and highly coloured beds of various plants in the Royal Horticultural Society's Garden at Chiswick is a circular one of Bouvardias, which attracts considerable attention by its fragrance and the purity of its flowers. The centre of the bed is of B. Humboldti, covered with flowers, and surrounded by a ring of Alfred Neuner; the edging is blue Lobelia. The old plants when taken up in the autumn should be cut back and potted. Early the following year they require potting again, and beyond protection from frost will give little trouble. They may be planted out with the rest of the summer bedding plants, and with an occasional watering will look well.—C. K.

— **GARDENING APPOINTMENT.**—Mr. Edmund Petty has succeeded Mr. A. Barker as head gardener to the Earl of Dunraven at Adare Manor, Co. Limerick.

— **CHANGE OF RESIDENCE.**—Mr. Charles Turner, gardener to J. B. Firth, Esq., late of Barningham Hall, Norfolk, has now taken charge of the gardens at Idsworth House, Hants, with Mr. J. B. Firth.

— **DEATHS OF TWO FRENCH ROSARIANS.**—Much regret has been caused amongst French Rose growers by the deaths of two prominent rosarians—namely, Messrs. Jean Ketten and M. Jacques Vigneron. Both were skilful growers, and had raised many varieties.

— **BOTANICAL DIAGRAMS.**—Coloured botanical diagrams are being issued by the Society for Promoting Christian Knowledge, that should prove useful for schools and lectures. Eighteen have, so far, come to hand. They are well printed on strong paper, and fitted with eyelets for suspending.

— **CARNATION LADY WANTAGE.**—This beautiful white self, which was honoured at the National Carnation Society's Show on July 26th, was raised from a packet of mixed seed by Mr. William Badcock of Reading. He is well known as a skilful Auricula grower, but not as a Carnation man, only growing a few plants in his garden, and was, therefore, fortunate to have such a choice variety amongst them.

— **JUNE FROSTS.**—The Rev. H. A. Boys writes to the "Meteorological Magazine":—"I made up my table of frosts for the first half of 1892 too soon; for June added one to the list of frosts in the shade, and no fewer than five to those on the grass. These were as follows:—31° on 18th and 30th; 30° on 13th; 27° on 14th; and 24° on 15th on grass, and 30° under shelter, with effects on flowers and vegetables truly disastrous. Thus the first six months of 1892, being 182 days, gave seventy-six frosts under shelter, and 112 frosts on grass."

— **LILIUM TIGRINUM.**—In one of the beds at Rede Hall, Burstow, edged with the tall variegated Grass, is a big mass of Tiger Lilies, which have been grown in the same spot for thirteen years, having been lifted and replanted, and some fresh soil added to the bed, only twice in that time. When I saw the mass the other day, probably 10 feet across, the first blooms were just expanding, and by the time this note appears in print the bed will be in superb bloom. Mr. Cottle, the excellent gardener, informed me that whilst this Lily did so well, candidum and auratum would not grow at all. The soil is very stiff.—D.

— **THE EFFECT OF JAPANESE GARDENS.**—"No effort to create an impossible or purely ideal landscape," says Mr. Lafcadio Hearn, "is made in the Japanese garden. Its artistic purpose is to copy faithfully the attractions of a veritable landscape, and to convey the real impression that a real landscape conveys. It is, therefore, at once a picture and a poem; perhaps even more a poem than a picture. For, as Nature's scenery, in its varying aspects, affects us with sensations of joy or of solemnity, of grimness or of sweetness, of force or of peace, so must the true reflection of it in the labour of the landscape gardener create not merely an impression of beauty, but a mood in the soul."

— **ST. ANNE'S-ON-THE-SEA FLORAL AND HORTICULTURAL SOCIETY.**—The second annual Show of this Society was held on Wednesday afternoon and evening in the Mission Room, St. Anne's. There was a very fine collection of exhibits in all the classes, and the Judges tersely described it as "a gem of a show." The proceedings were formally opened by Mr. J. Wainwright, and Mr. Whitham, Mr. Holt, and Mr. Peers also spoke. There was a large attendance of visitors during the day, and all expressed themselves as much pleased with the fine display of flowers, fruit, and vegetables.

— **INDIAN CORN.**—There is nothing absurd in the idea that the removal of the tassel from Indian Corn should increase the crop, provided enough were allowed to remain to fertilise all the ears. The development of the floral organs of a plant is a great strain on its vitality, and the strength saved might be diverted profitably, it would seem, to the development of the fruit. Experiments on this point, however, have given varying results, and some tests lately made at the Cornell Station show neither loss nor gain in Corn production. It was found, however, that the pollen and anthers in an acre of Corn contained 6.01 pounds of nitrogen, or an amount equal to that in a liberal application of a good commercial fertiliser.—(Garden and Forest.)

— HONEY AND FLOWERS.—On the road from Khandala to the famous Cave of Karli, in India, says Miss North, in her recently published "Recollections of a Happy Life," she came upon "a splendid tree of *Jonesia Asoka* full of orange flowers and delicate leaves. The priest of the temple found me one fine flower growing through a honeycomb full of honey which had been built round its stem. This was a very curious thing." She adds: "Did the buds push their way through the honey and wax, or was the thing built quickly round them? I never satisfied myself which was the first perfected."

— THE GREAT VINE AT MANRESA HOUSE, ROEHAMPTON.—I read with special pleasure the note of "A Countryman" on this recently, and it has been my farther privilege since doing so to see the famous Vine. It is not my intention to describe it, except to say that the Grapes, some 840 bunches, were ripe when I called, and a fine pomological picture they presented—a piece of successful gardening practice that deserves, as it has had, the highest possible praise. The hint thrown out by your correspondent that such a triumph of cultural skill may be thought worthy of a Veitch Memorial medal is well worth acting upon. It would be a fitting recognition of Mr. Davis's skill.—J. B.

— PRIZE CARNATIONS IN A COTTAGE GARDEN.—About a week ago I received a circular from Mr. Joe Edwards, 44, Herbert Street, Blackley, Manchester, intimating that his Carnations and Picotees would be in perfection from the 19th to the 24th. On Sunday afternoon I availed myself of the invitation, and was wonderfully struck to observe that such grand flowers could be obtained within two and a half miles of Manchester on the east (the worst) side. The day previous he had won several prizes amongst some of the best growers in England, both at Birmingham and Manchester, and all out of a cottage garden. His collection contains a selection of the best varieties in each class of both Carnations and Picotees, but the selfs are mostly of his own raising, and are far ahead of anything I have seen in the way of Clove Carnations. They embrace almost every shade of colour that can be produced in the Carnation.—JAMES PERCIVAL.

— BARNARD CASTLE.—The forty-ninth annual Show, promoted by the Barnard Castle Floral and Industrial Society, was held in the Castle grounds. The weather in the morning was of the most wretched description. During the afternoon, however, the day brightened, and became very fine. The entries were equal to last year's Show, and considering the late season of a very high order. The stove and greenhouse plants were a capital show, and brought several fresh exhibitors. In the open classes the following were the principal prizewinners:—Mr. Jas. Tullet, Raby; Mr. Wm. Boulger, Rokeby; Mr. Wm. Coulthard, Barnard Castle; Mr. George Finlay, East Layton; Mr. W. Mason Startforth; Mr. George Danby, Yarm; Mr. J. F. Grainger, Fence Houses; Mr. Robert Moore, Fence Houses; Mr. J. Marshall, Startforth; Mr. John Howe, Mr. R. J. Knaggs, and Mr. Jos. Howe.

— PHENOMENA OF PLANT LIFE.—An interesting paper on this subject was recently given by Mr. John Haigh before the members of the Walkley (Sheffield) Amateur Floral and Horticultural Society. In the course of his remarks he referred to the marvellous work performed by vegetation; the usefulness of forests; the distribution of plant life on the globe, from the red snow plant existing in the arctic regions to the mighty natives of the tropics. He touched on the benefits derived from growing plants in rooms; gave examples of plants yielding a considerable quantity of ozone; mentioned Alpine plants; and contrasted the vegetation of temperate and tropical zones. He then went on to describe in a graphic manner the seed and its functions, the work of the leaves, as well as the chemical changes which take place in the cells; how the various shapes of the cells of plants were caused, and the different kinds of wood produced; also the green colouring of plants. Consideration was given to roots and their functions, and how they absorbed food. The amount of water in the constitution of plants was referred to, a few examples of the various quantities in different plants being given. Mr. Haigh then called attention to the nature of plant cells, and the function of the stomata of leaves; also to the evaporation taking place from plants, the various kinds of inflorescence, and the types, shapes, and colour of flowers. In describing the production of seed, he explained why in most cases it was so abundantly given; pointed out its infinite variety of size, and its numerous benefits to mankind. The colours of fruits, the outside structure of seeds, nuts, &c., claimed some reference, and he concluded with touching upon microscopic, epiphytal, and parasitic plants. A hearty vote of thanks was accorded Mr. Haigh for the instruction and interest he had compressed into his paper.—E. D. S.

— TRADE EXHIBITS AT SHOWS.—May I be permitted to suggest that it would be a great convenience to visitors at horticultural shows and increase the business of the trade exhibitors, if those in charge of such exhibits were to wear a badge bearing the names of their respective firms? I have often myself found difficulty in identifying trade representatives when I have been wishing to give orders, in fact have sometimes been unable to do so, and what has affected me must also have affected others. It not unfrequently happens that those in charge of exhibits are not near their stands, indeed may be in another part of the Show altogether, and in such instances especially it would save would-be customers considerable trouble if they could "spot their man" wherever they met him. Such a badge as I suggest might be a neat circular leather one such as officials of shows wear, and no one, either principals or representatives, need think it derogatory to wear it.—HON. SEC. [The suggestion of our correspondent, who is an ardent amateur and admirable official, appears worthy of consideration.]

— THE HERB SWEET MACE.—A correspondent, whose name we forget, sent us in the spring a small offset of the herb that is known as Sweet Mace, with a request for its botanical name. The offset was planted, and now that flowers are produced the plant is identified as *Achillea serrata*. We are informed that it is grown as a culinary herb in gardens in the North of England, and that a "few sprigs of Mace" are often asked for by cooks. The mace of commerce, we may add, is the seed-coat or aril of the Nutmeg, and is in the form of a lacerated membrane. When fresh it is of a blood red colour, but becomes brown on drying. This is the most aromatic part of the fruit, and contains essential oils. It softens in the mouth, but does not melt; its taste is warm, aromatic, fragrant, and similar to a mixture of Cinnamon and Cloves, but more intense. We cannot detect any resemblance to the flavour of the true Mace in the so-called "Sweet Mace" of gardens. If our correspondent sees these lines he will perhaps be good enough to inform us for what special purpose the herb is used.

— MR. OWEN'S NURSERY AT MAIDENHEAD.—While at Maidenhead recently a *Journal* representative walked up to Castle Hill and called at Mr. Owen's nursery there. He found the head of the establishment, who is evidently a believer in the old adage that if you want a thing done well you must do it yourself, at work amongst his *Chrysanthemums*, and his skill was evidenced in the splendid condition of the whole collection. About 4000 plants are grown, and it is very difficult to imagine better pictures of robust, vigorous health. There are several hundred seedlings, amongst which are many varieties of great promise. All are remarkable for sturdy growth and splendid foliage. With flowers of corresponding quality there will be something to be proud of. Such encouraging results have attended Mr. Owen's previous experiments in seedling-raising that the large scale of his present operations in this direction can hardly be wondered at. There is also a fine collection of *Begonias*, very noteworthy for their compact, self-supporting habit; and, amongst many other features of interest, a beautiful display of Ivy-leaved *Pelargoniums*. Mr. Owen has achieved fame in the improvement of this valuable class, and the two magnificent varieties, *Souvenir de Charles Turner* and *Beauty of Castle Hill*, speak eloquently of his skill and judgment. All through the nursery the stock is in fine condition, and may be inspected by anyone with pleasure and profit.

— FLOWERS FOR PERFUME.—Once more the musical cry of the Lavender girl is heard in the London streets, says "The Morning," and the fields of Mitcham, Carshalton, and Beddington are yielding their fragrant harvest. The Lavender farms of Mitcham constitute one of the oldest industries of that part of the country, and in the middle ages the parish was heavily tithed in consideration of the profits derived from it. Although the Lavender is in reality a Mediterranean herb, it is nowhere more profitably grown than in England, the quality of the attar extracted from the plants in Surrey, parts of Hertfordshire, and in East Kent being far superior to that produced in any other part of the world. The most delightful form of agriculture might be considerably extended, as we are compelled to import annually foreign essential oils, which might just as well be produced in the country. Nor is there, so far as we can see, any reason why the Surrey farmers should not add to their plantations of Lavender, Thyme, and Mint, Rose gardens, with the object of producing the attar for which we annually pay large sums to the growers of Bulgaria, Persia, and India. The industry is a most lucrative one, and in no country does the Rose attain greater perfection than it does in our own.

— **MAIDENHEAD SHOW.**—With reference to your remarks in last week's issue concerning the staging arrangements for groups at this Show, I, as an exhibitor, heartily endorse them, for with me, and I believe with most of the exhibitors, the plan adopted has been most severely criticised, it being not one-half so popular or effective as the ordinary general way of grouping. Besides this, the accounts for last year's expenses include "£23 for staging, carting of same, &c.;" a sum, almost the whole of which is, in my opinion, really wasted, and which might be much better utilised either in giving extra prizes or in maintaining the old ones, for I notice this year a dropping off in the value of the prizes in certain classes. I trust the Committee will take note of your comments, and that before another show is held we shall see Maidenhead as much "up to the times" in effective arrangements as it certainly is in the quality of the exhibits.—**EXHIBITOR.**

— **TOMATO CHALLENGER.**—Yet another new Tomato, although not so new, as it received honourable mention at the Guildhall Fruit Show, and the variety is being sent out by Messrs. Hurst & Sons. Mr. Arthur Collins (Collins & Gabriel) invited me some six weeks ago to go and see this Tomato growing in their houses at Hampton. I could not get there until a few days since. There is some sense in going to see a variety that is represented by about 3000 plants, all in abundant fruit, filling house after house, for there are two houses 124 feet long and 12 feet wide, quite full of plants, trained up the roof, and in the centre bed, and some five or six shorter houses full also. This Tomato is a splendid cropper; the fruits are produced in clusters all up the stems. They are both deep and round, of rich colour, and literally a Plum with the breadth of an Apple, indeed the deepest, and for its size heaviest fruit I have seen. It also has capital flavour. For market purposes Challenger could hardly be excelled, as it is just the size to suit the market taste, for large fruits will not do at all.—**A. D.**

— **GROWING MANY VARIETIES OF STRAWBERRIES.**—There are other reasons for growing many varieties of Strawberries than those stated by the Editor on pages 99-100. Strawberries are so much the children of circumstances that we cannot depend on any variety giving a satisfactory crop every year. Early bloomers may be destroyed by frost or stormy weather, while all varieties are liable to be destroyed by heavy and continuous rains. One season may give us a heavy crop of earlies, while the late and intermediate varieties may be destroyed. Some Strawberries grow and yield large crops with careless cultivation, while others will not bear well unless with the greatest care in all the details of culture. I believe this care, or carelessness, as the case may be, has more to do with the result of a crop or no crop than favourable or unfavourable soil or locality. I have grown a hundred varieties of Strawberries at one time beside seedlings, and the foregoing are my impressions. There is another important thing in connection with Strawberry growing. Stout fruitstalks that stand erect and, as some say, carry the fruit above the soil, are desirable, but I doubt their existence, as all Strawberries come to the ground with a heavy crop. Short fruitstalks beneath heavy and healthy foliage escape frosts, the erect ones do not.—**W. T.**

— **HUYTON AND ROBY—WITH WHISTON—HORTICULTURAL SOCIETY.**—The Huyton and Roby Horticultural Society, which at one time was one of the leading societies in the Liverpool district, but which has been abandoned for a number of years, is about to enter upon a new lease of usefulness by holding a Chrysanthemum, plant, and fruit Show on Nov. 12th. Recognising the valuable work done by the cottagers, it is including the important colliery district of Whiston, where cottage gardening is carried out in an excellent manner, and has been promoted for the purpose of stimulating still further the growth of flowers, fruits, and vegetables, and more especially for the encouragement of cottage gardening and the cultivation of allotment gardens. It is not intended to interfere with any other society; the date of exhibition and all other arrangements are fixed so as not to clash with any local Show. Coming to the work of electing officers and making all necessary arrangements, the Committee do not contemplate holding an outdoor Exhibition this year, but prizes will be awarded to those cottagers having the best kept vegetable garden and the best kept mixed garden, the work of judging being commenced on Aug. 22nd. About £50 will be awarded at the autumn Show, there being good prizes for Chrysanthemums in pots, miscellaneous plants, and fruit, both for professional gardeners, amateurs, and cottagers. The principal class is for twenty-four blooms, distinct, twelve Japanese and twelve incurved. In addition there are special prizes—for ladies only—for vases or epergne decorations. Lord Derby

has kindly promised to become President. In addition there is an excellent list of patrons. Geo. G. Musson, Esq., Holly House, Roby, is an ideal Chairman; J. G. Kitchen, Esq., Fernwood, Huyton, and Henry Middlehurst, Esq., Sandfield, Archway Road, Roby, are Hon. Treasurers; and an excellent Secretary has been found in Mr. J. Taaffe, Bay Tree Cottage, Roby. A strong Committee has also been secured, and the Huyton and Roby Show promises to occupy once again a foremost position.—**R. P. R.**

— **OUTDOOR EARLY PEACHES.**—These have been wonderfully good this season. On the 25th of July we gathered the first fruit of Alexander from a south wall, and five days later from a tree growing against a west wall, both two-years-planted trees. The former gave us five dozen medium sized highly coloured fruits; indeed, the manner in which they coloured was a surprise, as the weather was none too bright. The flavour of this variety is only second-class, but being so early this is not considered so great a drawback as it would be otherwise. On August 3rd we gathered Early Louise from a south wall, and Hale's Early the following day from a similar position. The former was of good size and highly coloured and of much better flavour than Alexander. I consider this one of the best early Peaches for outdoors. Hale's Early is the best in quality of the three; the fruit swells to a good size and is exceptionally well coloured; in fact, with us it puts on intense colour, more than any variety, except, perhaps, Bellegarde, which is now fast approaching the ripening stage. Waterloo is said to be the best of the early varieties. I hope to prove it next season; one tree of this sort has not yet arrived at a fruiting stage.—**E. MOLYNEUX.**

— **A SCOTTISH SHOW DISPUTE.**—An unfortunate dispute has arisen between Messrs. Cocker & Son, the well-known Aberdeen Rose growers, and the Committee of the Royal Horticultural Society of Aberdeen. Disapproving of a new departure in the policy of the Society Mr. Cocker, sen., who had been one of the directors, resigned and intimated the withdrawal of his usual contribution towards the expenses of the Show. Thereupon the Committee refused to accept an exhibit from Messrs. Cocker & Son at their show. The firm brought an action against them to compel them to do so, but it was shown that a rule existed that all exhibitors must be members and pay their subscriptions by August 1st. The fact of Messrs. Cocker & Co. not having paid their membership subscription by that date caused the verdict to go against the pursuers. It would be foolish to presume that Messrs. Cocker & Son did not intend to pay their subscription; as a matter of fact they offered it a few days later, but it was then refused, and it appears clear that the Committee took shelter in a technicality. We agree with the Sheriff that it was a pity such a case should have been taken into court.

— **FRUIT PROSPECTS IN BEDFORDSHIRE.**—Duchess of Oldenburg, Kerry and Wyken Pippin, also Court-Pendû-Plat Apples, taken as a whole, are about half a crop; Blenheim Orange, Fearn's Pippin, Jolly Beggar, and Schoolmaster are carrying good crops; Lord Suffield and the Codlin type are cropping well. Pears as bush trees are very thin of fruit, except Louise Bonne of Jersey, Bon Chrétien (Williams'), and Beurré Clairgeau; but on walls they are better. Plums generally are a very thin crop, Victoria being the best; but on walls Rivers' Early Prolific and other culinary kinds, and also Green Gages, are carrying fairly good crops. Apricots are thin generally. Peaches and Nectarines on unprotected walls are carrying full crops, but they are ripening later than usual, and the fruit is rather smaller, owing no doubt to the cold and cloudy weather in July. Cherries are not much grown; they are about half a crop, rather small. Walnuts and Filberts are generally good. Bush fruit—including Gooseberries, Currants, and Raspberries—are plentiful. Gooseberries and Currants have been very much infested with the caterpillar, which has given us much trouble to keep under; the bushes were so bad that we had them well sprayed with the garden engine, using clean water, following quickly with a rather strong dressing of soot and lime under the bushes, giving a good dusting round the stems, so as to prevent them crawling up again; this plan seemed to effectually destroy them. Strawberries have been good and plentiful; Laxton's Noble was the first to ripen on the 9th of June in a very open and exposed situation, finishing the first week in August with Oxonian and Laxton's Latest of All, the latter a very good Strawberry of the British Queen type and flavour; A. F. Barron, Jas. Veitch, and Laxton's Commander (this variety has very strong flower stalks, supporting the fruit well above the ground). I have no outside experience of John Ruskin, but it is a good forcer.—**G. R. ALLIS, Old Warden Park, Biggleswade, Beds.**

NOMENCLATURE OF BIGENERIC HYBRIDS.

THE increasing number of bigeneric hybrids, particularly between *Lælia* and *Cattleya*, makes it necessary to ask if some simple distinctive name cannot be found for them. Several *Lælio-Cattleyas* have appeared this year, and such remarkable results have been achieved by crossing the two genera that the mine is sure to be further worked. In all probability fresh hybrids of this character will crop up somewhat frequently for a year or two, and a name less cumbrous and clumsy than *Lælio-Cattleya* would be very

Although to those unacquainted with the meanings of these terminations one name is as good as another, as a matter of fact it is not so, for inaccurate application of them may mislead. Names should be latinised correctly or not at all.—FLORA.

CATTLEYA REX.

Interest was somewhat diverted from this *Cattleya* when it was offered for sale on May 5th by the endeavours that were being made at that time to focus the attention of orchidists on *C. Alexandræ*, yet it is more than likely that it will become much more popular than the latter. There was only a coloured plate to judge it by on that occasion, but it has since flowered in the collections of Welbore S. Ellis, Esq., Hazelbourne, Boxhill, Dorking, and H. M. Pollett, Esq., Fernside, Bickley, and was shown by both at the Drill Hall on July 26th. It proves to be a handsome form, and was awarded a first-class certificate. The sepals and petals are creamy white. The lip is heavily fimbriated, rich purplish crimson with creamy edge, and having

three white central veins. Other white veins radiate from the centre, fading out an eighth of an inch from the edge. The base of the lip and the exterior of the tube are tinted with yellow, and the throat is veined with the same hue. Mr. Ellis's specimen bore three flowers on the peduncle; Mr. Pollett's, which was a larger plant, four. This points to the fact that it is fairly free flowering, for it should be remembered that small pieces were shown. Perhaps there was some tinge of disappointment with it, but if not strikingly distinct and beautiful, it is likely to prove useful, for it will probably prove to be a winter bloomer.

Cattleya Rex was imported by L'Horticulture Internationale, Brussels, but though new to us Mons. J. Linden claims to have met with it fifty years ago. The highest price realised for one specimen at the sale referred to was 8½ guineas. The flower is represented by fig. 24.

ESTABLISHED AND IMPORTED ORCHIDS.

ONE of my readers, who is commencing the culture of Orchids, asked me recently, writes a correspondent of "LO'rchidophile," why established plants were found at a better price [presumably from the buyer's

point of view] than imported ones. My reply was that there is no surprise to hope for amongst established plants, unless the dealer happens to be deceived. Imported plants are composed of varieties having a different value. In a hundred of them ten may be reckoned good, ten bad, and eighty medium in quality. The ten good plants often pay for the entire hundred. The buyer takes an opportunity of selling these plants, and is in a still greater hurry to get rid of the dross. That is why it is that it is easy to find plants offered at 4s. which may have cost a pound. The dealer, who does not care to cultivate or find room for defective plants, rids himself of them at any price, and he is right.

But this is not all. Established plants are accustomed to the greenhouse of the horticulturist, to the cares that they receive. When suddenly transported to a different centre they have to habituate themselves to a new life. It is to his interest to push his introductions, to flower them; he knows that the good varieties will give him a good return for his money, and he hastens to attain this end. At an equal price the introductions are worth much more than established plants. Observe what passes at the auction sales. Buyers are on the look out for importations, and however strong

FIG. 24 — CATTLEYA REX.

desirable. As a combination name has the advantage of affording a clue to parentage I venture to suggest *Læleya* as a very suitable one in the present case. It is euphonious, while clearly indicating the genera from which the hybrid was derived, and if accented on the second syllable there would be no danger of its being confused with *Lælia*. If Mr. Roife and others responsible for descriptions of Orchids would officially adopt this name a matter would be set at rest which, if not serious, is certainly inconvenient.—W.

DOG LATIN IN ORCHID NAMES.

IF more care is not exercised in the latinisation of English names for plants we shall be flooded with examples of inaccurate and misleading nomenclature. A short time ago a yellow *Arum* emanating from Pentland House appeared under the name of *Calla Pentlandi*, and now we have an Orchid exhibited under the name of *Cypripedium Elsteadiana* that has been raised at Elstead House. If these plants are intended to be named after the place in each case, and it may be assumed that this is so, both are incorrectly named. The termination "ense" should be given to both. The termination "i" indicates that the introducer's name is applied to the plant; "ana," on the other hand, being purely complimentary.

established plants may be they fight shy of them. Amateurs say to themselves, "If someone wants to get rid of an established plant which has received a good deal of attention it cannot be a very good variety," and they will have nothing to do with it. It is certain that many established plants offered for sale have a real value, but experienced orchidists prefer, rightly or wrongly, to leave them alone. When an established *Trianae* that has flowered is bought for 4s. or 5s. it may be put down as a bad one; if it were not the dealer would have sold it in bloom. When an introduced plant is bought it may be bad, but there are 80 chances in 100 that it is good, 10 that it is perfect, and 10 only that it is not worth more than the established plant of the same price. Offer the established plants at a low price to an experienced grower and you will see what a reception you will get; offer him imported plants and he will show himself better disposed.

All dealers attach great importance to the variety; they know that a beautiful one gives no more expense than a bad one, and they keep it or sell it at a good price. In choosing imported plants amateurs should no longer allow themselves to be guided by the strength of the specimens, but rather by their condition. If a plant has good eyes, even though it be small, it is worth more than a strong plant of which the eyes are gone. It is a question of experience, which is usually acquired quickly, although it sometimes proves to be expensive.

CYPRIPEDIUM CAUDATUM LUXEMBOURG VARIETY.

THE tide of new *Cypripediums* has flowed somewhat slowly of late, but a notable addition to them was made in *C. caudatum* Luxembourg variety, which was shown at the Royal Horticultural Society's meeting on August 11th by Mons. Godefroy-Lebeuf, 5, Rue d'Edimbourg, Paris, when a first-class certificate was awarded. It is a very beautiful and distinct variety, chiefly remarkable for the fine colouring of the sepals. They are rich buttery yellow, paler towards the base, and veined with green. The dorsal sepal is narrow, and the edges curl back until they meet. It arches over the pouch so much as to fully display the deep yellow back. The lower sepal, on the contrary, is broad and flattened. The pouch is dull green, dotted on the edges of the throat with purple, the interior pure white. The tails are long, twisted, and of a dull purple hue. Fig. 25 represents this charming variety.

ORCHIDS IN BELGIUM.

AT the last monthly meeting of the Belgian horticulturists and of the Royal Botanic Society of Ghent certificates of merit were awarded to the following Orchids:—*Cattleya gigas* Warscewiczii, *C. g. imperialis*, *Cypripedium Rothschildianum*, *C. Curtisii atropurpureum* and *Gongora atropurpurea* from M. A. van Imschoot; *Cypripedium lævigatum platytænium*, *C. elegans hybrida*, *Odontoglossum tentacullatum* and *O. mulus-odoratum* from M. Jules Hye; *Lælia elegans Vervaeti* from M.M. Edm. Vervaet & Co.; *Sobralia xantholeuca* from M. Moens, and *Phajus Humbloti* from M. van Geert.

SMILAX (MYRSIPHYLLUM ASPARAGOIDES).

IT has fallen to the lot of few trailing plants to become so rapidly and universally popular as the extremely useful plant under notice. Almost any kind of cut flower decoration may be vastly improved by the addition of a few trailing shoots of it. The free and easy method of arranging both plants and flowers which has been fast developing during recent years has rendered the use of trailing shoots imperative, and although we have for years grown

many which answered the purpose fairly well, yet this *Smilax* is welcomed as being something distinct in appearance from all others, and in many respects superior to them.

Nothing I have yet seen is so useful for hanging over the sides of glasses and bowls on the dinner-table, or for trailing in gracefully curving sweeps upon the tablecloth. As greenery for arranging with flowers to form a shower bouquet nothing is more sought

FIG. 25.—CYPRIPEDIUM CAUDATUM LUXEMBOURG VARIETY.

after than *Smilax*, the demand for which is so great that there are few places where a sufficient quantity can be obtained. This scarcity, I believe, has been brought about by cutting too hard before the plants are thoroughly strong, thus giving them but little chance to make good growth. I venture, however, to predict that when its culture is better understood *Smilax* will be grown largely and well, and the difficulty which is now experienced in its culture will be but little heard of, for it is really a very accommodating plant, and will grow well under widely differing conditions.

The best way to work up a stock of plants is to sow seed some time during the present month, and keep the young plants obtained growing steadily for twelve months, by which time each plant, if well grown, will produce a shoot from 8 to 12 feet in

length. As soon as these shoots have been cut for use the plants should be kept rather dry till they show signs of starting in the spring. Then water will be required more frequently, and when growth is well advanced the plants should receive a slightly larger pot, but care should be taken at all times to avoid overpotting.

About this time last year I received a packet of seed from New York. I sowed part of the seed myself, and gave some to a gardening friend. Both packets were sown in small pots and placed in a cold pit, where the plants were kept till frosty nights became prevalent. They were then placed close to the glass in an intermediate temperature, and kept growing steadily throughout the winter.

Early in the spring these plants, which till that time had been grown under the same conditions, were given widely different treatment. From five to eight seeds had been sown in a pot. Some of the seedlings were placed in 6-inch pots, and as soon as they were well established were trained to strings placed on a wall near the front of a cool conservatory, others were divided, and each plant placed in a 3-inch pot. The plants thus divided were put under handlights and kept close till well established. After having been inured to more light and air they were transferred to 5-inch pots. Some of these were placed against the sashbars at the ends of vineries, others against the glass partitions which divide the range of vineries into compartments. Strings were fastened the whole length of each sashbar, to which the young shoots quickly clung, and up which they gradually ascended. All have done well, but those trained against the ends of the houses are somewhat stronger than the others, and those grown throughout in the cool conservatory have not grown so freely as other plants given the heat afforded to Vines in the growing season.

In all cases where the plants were grown singly in pots the growth made has been much freer, but there is this to be said in favour of the growth produced from clumps—it is more suitable for using in shower bouquets and small vases; but for dinner-table decoration the longer the shoots the better, hence it is advisable to grow some plants under each system, with the slight alteration that those intended for growing singly in pots ought to be sown thus in very small pots to begin with. A few plants have been planted out against the back wall of a vinery, and by the way they are growing at present I anticipate this much-used plant will be thoroughly adapted for growing in such positions—if so, that fact should solve the oft-repeated question as to what is the best plant to cover the back wall of a vinery with, for there can be but little doubt that the demand for Smilax will be very great in the future, and if at the same time a plentiful supply can be had by growing it on walls which have previously produced nothing of special value it will be the more generally grown. A compost of loam, leaf soil, and a little decayed manure, with plenty of sharp sand, and some charcoal, lime rubble, or wood ashes added to keep the soil open and sweet, suits this plant admirably. It seems to be by no means fastidious in the matter of soil, provided the pots are well drained and the soil kept sweet, but stagnation at the roots is inimical to its well-being, and if continued fatal to its existence.—H. DUNKIN.

JUDGING HERBACEOUS FLOWERS.

I AM sure many readers of the Journal will be grateful to Mr. Garnett for his remarks under the above heading. Exhibitors and secretaries of societies will feel deeply interested in them, and curious as to the exact wording of the schedule. This coming so soon after Mr. McIndoe's letter makes it an important question, which I have not seen discussed in your valuable paper. As an exhibitor I am often puzzled, and as a local secretary dismayed, at the construction often put on the wording of the classes for cut flowers at exhibitions.

Let us take a few examples. Twelve cut blooms Chrysanthemums, distinct. Twelve bunches, distinct, three in a bunch, not less than three varieties. Note: Disbudding not allowed. Collection of cut flowers, four varieties, distinct species (cottagers only). Do cottagers know the distinct species, or only botanists? Collection of hardy cut flowers. Now comes the wrangle. Hardy where? A species hardy in Kent is not necessarily so in Durham. Then, how many? Are they to be bunched or mixed, or what? Six bunches of hardy flowers, shown in a box, distinct species. This is a gain, but still I may have five varieties of Pansies in one bunch, and so on with the other species. The opposite to the above is six varieties of cut flowers, distinct. Now, in a class of this description not one of six exhibitors at a country show in July complied with the direction. Again, twelve bunches of cut flowers, cut from the bed; and twelve bunches of garden flowers. In this schedule is a note: "Quality of flowers and general effect to be the leading features in these classes." Another schedule says, "The exhibits are to be made as interesting and instructive as possible." This is a very indistinct way of putting the matter I am aware, but so long as cottagers and others escape disqualification so long will the error of

having three colours of Stock, or Phlox, or Zinnias put in the place which should be occupied by only one variety continue.

There is a consolation, however, that in the future we may educate "our masters" up to the spirit of schedules and exhibitions. Mr. Garnett may also be encouraged to hear, that even in this dark spot the working classes are rising in horticultural matters, and especially in growing herbaceous flowers.—NORTHANTS.

HEATING WITH GAS.

I AM about erecting a very small propagating house, and as I do not keep a regular gardener it would be a very great convenience if I could heat it with gas. Can any of your readers tell me from experience about what the cost of consumption would be? I find it very hard to get any reliable information. The house I think will be span-roofed, about 7 feet 6 inches long by 8 feet 6 inches wide. On the one side would be a tank to propagate upon, and on the other side a bed for plants. There would be, I suppose, a flow and return along each side, so there would be about 30 feet of 3-inch piping to heat. The gas company tell me that it takes 1 foot of gas to heat 1 square foot of piping per hour to 180°. I therefore suppose that it would take about 20 feet of gas per hour to heat the 30 feet of 3-inch piping. This will cost about three farthings per hour, or 1s. for fourteen hours, or 1s. 6d. for twenty-four. This would be too much. I have a circular before me of a gas stove which the inventor claims will heat a house 14 feet by 9 feet with an average of 6 feet of gas per hour, but neither the amount of piping nor temperature of the house is stated. For a few years I have managed a coke stove, and there is one here for the greenhouse, but I have only lit it at night when frost threatened. With propagating, however, I suppose the heat is afforded continuously, and this with coke would be a serious toil. Any information will much oblige.—S. J. A.

LIFTING AND PLANTING PEACHES AND NECTARINES.

TREES which have been long subjected to very early forcing are seldom too vigorous, but often become so enfeebled as to need the removal of the weak growths. Such trees should be taken in hand as soon as the leaves are mature and before they fall, and it is advisable to shade the house before commencing operations, especially if the weather is bright. Remove the old soil from amongst the roots of such trees and supply fresh turfy loam, to which has been added a sprinkling of bonemeal and wood ashes—say, half a bushel of the first and a bushel of the latter to each cartload of loam. Raise any roots that are low, and place them in fresh soil nearer the surface, carefully working the loam amongst the roots, making all compact, and follow at once with a good watering. If the trees are in very bad condition it may be necessary to lift them altogether, rectify the drainage if defective, and put all into proper order. It is of no use, however, attempting to mend trees that have begun to lose a number of branches from gumming, for they are so full of the germs of the disease that lifting only accelerates young growths, which in two or three years are as badly infested with gummosis as any of the older branches.

Young trees are very much better than old that have become afflicted with this disease, which lies dormant in the tissues and only awaits an opportunity to break out again. Young trees may be cured by judicious lifting and cutting out the gummed branches, but when the disease has possession of the old limbs or of the stem it is better to uproot and plant young trees perfectly free from this increasing malady.

Any trees that grow too luxuriantly should be lifted and have the roots pruned, the more fibrous ones being laid in carefully as near the surface as practicable, making the soil firm. By sprinkling the trees occasionally, and continuing the shading for a few days if the weather is bright, the foliage will be retained long enough to insure the emission of fresh rootlets, and with these ready to cater for the growths when the trees are started there will be a good set of fruit, and it will stone and finish satisfactorily under favourable cultural conditions. The shade must be discontinued in the course of a week or ten days. If the old leaves are cast no harm will follow, as the laterals and the young wood having more or less elaborative power will further root-action.

When it is found necessary to displace old trees it is well worth while to give the new ones a chance, not merely digging a hole and planting them, adding a little fresh soil to give them a start; but by removing the old soil and providing fresh for making new borders in time to settle somewhat before planting the trees. The best description of loam is that from a pasture where the soil is friable but rather strong. That of the old and new red sandstone is no doubt the best, but most strong loams will grow Peaches and Nectarines well, provided they contain enough calcareous matter and are sufficiently porous as to allow water to percolate slowly but surely through the mass. Old mortar rubbish will give the needful porosity to heavy soil as well as supply lime, and clay marl will provide retentive power and lime for light soils. The border must be efficiently drained, and provision made to carry off the superfluous water. A foot in depth of drainage, and 2 feet depth of soil are ample. Instead of making the border its full width at once a 4 feet width is ample to begin with. The compost should be in good working order and put together firmly, having the borders in readiness by the end of September.

The best trees for planting in houses to be subjected to forcing in the first year are those which have been trained on trellises in cool houses, two or three years, or even four, if due regard has been had to lifting, or trees grown against walls in the open may be utilised by cutting the roots in, taking out a trench one-third the distance from the stem the branches extend. If this is done early in September and the trench left open a fortnight, the roots not allowed to suffer by want of water, and the foliage kept fresh by shading from bright sun, the trees may be lifted with a ball of soil at the end of the month and planted in a house, where they will take to the fresh soil at once, and be in a position for starting by the new year to afford fruit during the season.—G. A.

DISQUALIFYING EXHIBITS.

SOME remarks have appeared in the Journal lately upon the above subject. There is a point that I should like to touch upon. On examining schedules we usually find prizes offered for a collection of vegetables, and on examining these collections we find in nine cases out of ten Cucumbers and Tomatoes included. These are clearly fruits, and in my opinion ought to be disqualified, but I have never known or heard of that being done. I have heard of a case where a collection of vegetables was disqualified because it contained Beetroot, which was thought by the judges was not a vegetable. My idea is, if fruits such as I have named above are admitted with vegetables, then Melons are equally admissible in the collection.—R. C.

[We have often heard claims advanced for the inclusion of Tomatoes in the fruit classes at exhibitions, and if we mistake not they were included in a very large prizewinning collection in the north a few years ago, but a revolution in flavour will have to be effected before they have a recognised place on the dessert table, even when sweetened with sugar; and so long as they are prepared with oil, vinegar, salt, and pepper, and eaten as vegetables, we suspect they will remain in the vegetable classes. So with Cucumbers. Our correspondent does not ask that the Vegetable Marrow be included in the fruit classes; perhaps he forgot it. The proposition respecting Beet is so entirely novel that we could not think of erasing it, and it seems there are novelties in "judges," too. Perhaps some of our readers may like to say something on "R. C.'s" views.]

HASELEY MANOR.

HASELEY MANOR, the residence of Alfred Hewlett, Esq., is situated about three miles distant from Warwick, on the main road to Birmingham. Starting from the first-named town, the road traversed runs over gradually rising ground till Hatton, the adjacent village to Haseley, is reached. Here we find ourselves on the summit of a large plateau which extends in some directions as far as the eye can reach. It may therefore be inferred that the position is high and dry, with a bracing air, and not unfrequently the inhabitants experience a terrific and destructive wind. The effect of these uncertain gales is seen on all sides. Trees by the roadsides and on the outskirts of the woods show a great preponderance of growth on the north-east side, as the force of the south-west winds causes branches, and in many cases trunks as well, to bear in the opposite direction.

The Manor of Haseley is of very ancient date, but the new Manor House was begun in 1874, and completed in 1880. This is reached from the lodge near the main road by traversing a fine broad well-made carriage drive about three-quarters of a mile in length. This drive is upwards of 16 feet in width, and is planted on each side with trees to form an avenue. It is gratifying to note that ample provision has been made to allow these trees to develop into full beauty without encroaching upon the roads, a wise proceeding which has in too many instances been overlooked in the laying out of gardens. As we approach the mansion abundance of evidence is forthcoming to show we are in the grounds of one who is a lover of trees, and who pays due consideration to the future. Permanent trees are planted at wide distances apart, and the spaces filled up with others of quick growth for present effect, and to help in some measure to break the force of the strong gales experienced.

Planting has been carried on regularly by Mr. Hewlett and his energetic gardener, Mr. George Clements, and at the present time few places can boast of so many handsome young trees, fast developing into stately specimens. Large numbers of splendid young trees must soon be cut away to make room for the permanent ones to extend. Thinning is well looked after annually in order to keep the finest specimens from being spoilt through overcrowding. Under ordinary circumstances this would be done much more freely, but owing to the exposed position it has been found expedient to thin as gradually as possible to afford shelter to the permanent trees. Many of the outer groups and belts have, however, now grown to a sufficient height to give substantial shelter to other portions, so that by thinning freely the inner groups and trees in the least exposed places, those left will soon be too firmly established to be much affected by even the Haseley gales. One advantage of the situation is that the Golden Yews, Retinosporas, and Thuias colour to perfection; indeed, I do not remember ever having seen these fine Conifers with colours so vivid and beautiful. Wellingtonia gigantea, Cupressus Lawsoniana and erecta viridis, Thuia Lobbi, T. gigantea, T. pendula, Picca pinsapo, P. Nordmanniana, P. concolor, Pinus insignis, P. nobilis, as well as many others, are all represented by beautifully grown trees, deciduous trees and flowering shrubs being also freely used.

Weigela rosea and a very superior type of Mock Orange were quite a picture at the time of my visit.

Rhododendrons are also a great feature, and have been planted extensively. Several large beds are filled entirely with choice varieties, and large masses and belts of them occur in several parts of the grounds. Some of these were planted fifteen years ago, but as they did not succeed very well have since been taken up, and after adding cocoa-nut fibre refuse and sand to the soil already there, were replanted, and are now in a thriving state. Other belts have been recently enlarged by planting unnamed seedlings in front of them. In other places named varieties are arranged in groups, each group containing only one variety. The effect produced by such fine masses when in flower must indeed be grand, and I was extremely sorry that my visit was made too late in the season to see them in that stage.

In this part of the grounds, which is near the mansion, two broad terraces are situated, the walks being 10 feet wide, with a flight of steps at each end connecting the two terraces. Each terrace contains a level expanse of turf capable of holding two tennis courts, while another open expanse of lawn near is large enough for three more. One of the best views about the grounds is obtained from the terraces above mentioned. It looks out upon a wide expanse of park dotted here and there with trees, while in the distance, on slightly rising ground, a pleasing picture is formed by a fine plantation of large trees. This was much improved a few years ago by planting around it a belt of Coniferæ, and so arranging the outline as to form a winding alcove at a point where the tree tops were much lower than in other parts, thus showing a glimpse of the distant sky line beyond the trees.

We next pass on to the flower garden, which is surrounded with shrubs and trees and a belt of Rhododendrons. The garden is in five divisions, with a walk 7 feet wide intersecting it. The central portion is in the form of a square 55 feet across; in the middle is a large circular bed wired in the shape of a huge top 8 feet in height, the wires being used for training Clematises, and underneath the new white Marguerite, Calceolaria amplexicaulis, Perilla nankinensis, and blue Lobelia were arranged in circles, masses, and bands. Other attractive beds are four round ones having a little circular hedge in the centre of Euonymus radicans variegata filled in with Marguerites, bands of scarlet and Happy Thought Pelargoniums, and Dracæna leaved Beet, the edging being Sedum acre aureum. Two other beds in the shape of crowns are filled with bronze or tricolor Pelargoniums. Others of the same shape are planted with Pelargonium Golden Chain and edged with Cliveden Purple Viola. Surrounding the central square are four half-circles containing in all about twenty beds. A few of the most striking ones are planted as follows:—Henry Jacoby Pelargonium, edged with white Viola, and a white Pelargonium edged with dark Viola. Lobelia Queen Victoria (the well-known scarlet herbaceous one) was extremely effective when edged with blue Lobelia. Brugmansia Knighti and the old hardy Fuchsia Riccartoni were associated in another bed, while others were filled with Stocks, Asters, Dianthus Heddwigi, Phlox Drummondii, and Verbenas. Near this part of the grounds there is a beautiful and extensive prospect. Good views may be obtained of the "City of Spire," the ruins of Kenilworth, the Edge Hills, and nearer views of stretches of grass and woodland, prettily diversified by hill and dale.

We next pass on to the rosery, which is circular in shape, having a diameter of 120 feet. A high Laurel hedge surrounds it, at the base of which wire netting is securely fixed to keep out rabbits, which give much trouble about the grounds. Sweet Briar has been planted around the wire netting and trained to it, so that at the present time no part of it is visible; this struck me as being a capital idea, which might with advantage be carried out in many places, especially where the scented Briar shoots are in great demand. The rosery is divided into four quarters by walks 7 feet wide, each quarter containing seven beds; a border 6 feet wide runs round the whole next the hedge. The arrangement is a capital one, and was designed and laid out by Mr. Clements, who kept one important point in view, viz., to have the beds of such a width that the cultural details could be attended to without being continually trampling on the soil. It is one thing to have a good Rose garden and another to have good Roses, but it is not always that the two are found in conjunction with each other. There is, however, no mistake about their presence here; the Roses are indeed grand and the garden throughout in perfect order, not a weed, not a withered leaf to be seen. A considerable amount of labour and expense has been incurred in replanting some of the beds and in keeping up a good stock of the best kinds, and giving promising new ones a trial. It must therefore be gratifying to all concerned to find their efforts thus rewarded. I will give the names of a few which were particularly good:—Madame Gabriel Luizet, Ulrich Brunner, Captain Christy, Merveille de Lyon, Sénateur Vaisse, Countess of Oxford, Duchesse de Vallombrosa, Duke of Edinburgh, Madame Victor Verdier, and Marie Baumann.

Kitchen garden and glass houses are situated at a considerable distance from the mansion, on the north side of it. About 2 acres are enclosed within high brick walls; another plot to the extent of an acre outside the walls is used principally for growing Rhubarb, Seakale, and young nursery stock. An arch over one of the walks here, 27 yards in length, is utilised for training Blackberries on. Some of the best American varieties have been tried, but Mr. Clements has now discarded them in favour of those he obtains from hedgerows, which sometimes ripen as many as sixty berries on a spray. In the walled-in kitchen garden fine crops of vegetables of all descriptions were in a promising condition. Too much space would be taken up by giving details; but

especial mention ought to be made of a few grand rows of Peas, which were as even and well podded as it seems possible to have them. One variety was St. Duthus, which is much grown in this locality, another being Renown. Strawberries, too, were in extra good condition. A variety, grown under the name of Hayward's Prolific, was carrying an enormous crop. Mr. Clements attributes his success in securing such heavy crops in a light soil to the fact that the soil around each plant is rammed firmly each year.

The glass structures have until recently been somewhat limited, but with the addition of a substantial range, consisting of two vineries, a span-roofed conservatory, and an excellent fernery, a better opportunity is now given to supply the demands of the establishment, and arrangements are at present being made for the erection of two other houses. In the conservatory, which was gay and well kept, I noticed a fine batch of seedling *Streptocarpus*. These are a very showy and useful class of plants. Fuchsias, Begonias, Zonal Pelargoniums, Justicias, and Abutilons were also in capital condition. The fernery is well fitted up with artistically arranged rockwork, the Ferns being planted in pockets and carpeted with Lycopodium, while overhead are trained such useful subjects as *Asparagus plumosus* and *Smilax*. A winding walk is formed among the rocks, by which the upper portion of the back wall is brought within easy reach. When looking down from this point the verdant green Fern fronds of so many different forms, and the glistening water splashing against some of the rocks and trickling down the sides of others, leave a vivid impression of a fairy scene.

The vineries are planted with such useful varieties as Black Hamburgs, Madresfield Court, Buckland Sweetwater, Muscat, and Gros Colman. These Vines are carrying one bunch each this year. A number of Black Hamburgs, just beginning to colour, are growing in pots plunged in the middle of the house, and trained to the upper portion of the roof. Other houses are filled with a variety of plants useful for decorative purposes, which are in great demand. Mr. Clements' favourite Tomato is Trentham Fillingbasket, on account of its great cropping qualities. I was much struck with the fine type of Cucumber grown, which is Dickson's Excelsior. It is of medium size, perfect in shape, and a good cropper. I predict it will in the future be extensively grown.

I should have mentioned the walks around one kitchen garden are bordered with fruit trees, Apples and Pears being planted 10 feet apart, and 6 feet from the Box edging. Some of the trees first planted in these positions suffered badly from canker where the roots penetrated the sandy subsoil. These were removed, holes 6 feet in diameter dug out, and concreted at the bottom. Healthy young trees were then planted, which are now going on in a satisfactory manner, and by rooting out all the old trees which had shown signs of canker, and planting young ones on prepared stations, Mr. Clements hopes to prevent another attack of canker.—H. D.

HORTICULTURAL SHOWS.

QUEEN'S ROAD HORTICULTURAL SOCIETY, SHEFFIELD.

THE tenth annual Exhibition of this Society was held on Monday, August 15th, in the beautiful grounds of "The Farm," the Sheffield residence of the Duke of Norfolk. The exhibits were all arranged in one immense marquee, situate at the head of the Park overlooking the Duke's residence. Down the centre of this was arranged a number of groups arranged for effect, mostly of a very high order of merit, some of them being thoroughly artistic in their arrangement. Whatever may be urged against the prevailing custom with committees in offering prizes for these groups for effect, it cannot be denied that wherever so encouraged they prove the feature of the Show, and that they have a most telling effect in the technical and artistic education of the local gardeners. We find as a rule that where these groups are a new feature the first efforts of local gardeners invariably appear in the form of sloping banks of foliage and flowering plants and Ferns, packed sufficiently close together to hide the pots and the faulty parts of each plant; but each succeeding season that these groups are continued we find a further remove from this primitive form of grouping, until in the best efforts to be seen at old established shows, one cannot but admit that the mind and eye of a true artist have designed and superintended their arrangement. This is as it should be, and it is a legitimate argument in favour not only of continuing these shows, but also especially of the continuance of these classes.

The first prize in each of the two classes for a group of foliage and flowering plants and for a group of Ferns was taken by Mr. E. Pidsley, gardener to Mrs. H. Wilson, Westbrook, Sheffield; second, for plants, Mr. Topham, gardener to Councillor J. Smith; and for Ferns, Mr. W. Sheridan. In the open classes also stove and greenhouse plants and Ferns were especially well shown. For six foliage and flowering plants Mr. Pidsley was again first with a very fine collection, consisting of *Clerodendron Balfourianum* (large and well flowered), *Stephanotis floribunda*, *Croton Hookeri*, *Allamanda boliviensis*, *Maranta Makoyana* (a grand plant), and *Croton Hillianum*. Mr. W. Sheridan was first for six Ferns with very fine specimens. Begonias, Zonal Pelargoniums, and Fuchsias were very well shown in the open and gentlemen's gardeners' classes, but only very indifferently in those devoted to amateurs and cottagers.

Cut flowers, in stands of twelve, were a fine feature of the Show, and were very good throughout. Fruit and vegetables, on the contrary, were sparingly shown, and generally deficient in quality. Much of this was

attributable to the fact that the gardens of a very large number of the members of the Society and past exhibitors have during the past year been appropriated by the Midland Railway Co. for extensions to their sidings and goods sheds. It is satisfactory, however, to know that the Duke of Norfolk has, through his agent Mr. Ellison, provided other land, which is being laid out as allotments, to replace that thus lost.

An important portion of the Show was the exhibits not for competition. Messrs. Fisher, Son, & Sibray, and B. Crossland & Son each exhibited fine large groups of plants not for competition. Mr. D. Fellows had a smaller but very pleasing group. Mr. B. Simonite had a fine exhibit of cut flowers of yellow ground Carnations, mostly unnamed seedlings, to several of which certificates of merit were awarded. Mr. R. W. Proctor, Chesterfield, had a very fine collection of Roses and Carnations. A certificate of merit was awarded to him for a beautiful wire-edged Picotee named Mrs. Wilson. Mr. J. W. Wilson, florist, Handsworth, had a collection of Carnations, Picotees, and Pompon Dahlias, for which he was awarded a special prize, and also certificates of merit for two seedling yellow-ground Carnations—Mrs. Wilson and Dolly Gunn. Mr. J. Lamb, of Burton Joyce, Notts, sent a stand of six flowers of his new seedling rose-flaked Carnation Duchess of Portland, for which a certificate of merit was awarded. The Show Dahlias were, as they always are at this Show, very fine indeed. We have seen no better exhibited at any show this season.

Another feature of the Show, which formed a centre of attraction, were the exhibits in a class for a design for house and flower garden. The one taking first prize was a most elaborate and costly affair, which a label upon it stated had taken nearly 2000 spare hours in construction.

SHANKLIN (ISLE OF WIGHT).—AUGUST 17TH.

THIS Show was held in the beautiful grounds at Rylestone by permission of M. Sparatelli, Esq., and a better site could not well have been found, as it overlooks the Chine, pier, and esplanade. It proved one of the most successful yet held. The exhibits were shown in three large marquees. The collection of stove and greenhouse plants, groups, baskets of plants for effect, Asters, and Marigolds, which are a speciality in the island, were very good. The cottagers' vegetables were better than those shown by professional gardeners. Mr. Pritchard, florist, Christchurch, showed a splendid collection of hardy herbaceous flowers, many of them novelties. Special prizes were given by Messrs. Sutton and Sons, Reading; Messrs. Daniels Brothers, Norwich, and the Lady Isabel Atherley.

The Show was honoured by a visit from H.R.H. the Duke of Connaught, Prince Herman of Saxe-Weimar, and Princess Margaret of Connaught. Mr. W. Drover, one of the Judges, conducted them through the tents. The Duke expressed himself greatly pleased with the beautiful exhibits. On leaving the Show Mr. W. Drover presented the Princess Margaret of Connaught with a lovely bouquet, which the firm exhibited not for competition. The Duke thanked Mr. Drover, and intimated his intention of paying a visit to the Nurseries at Fareham.

Credit is due to the Chairman, Dr. Cowper, and the Committee for the success of the Show; and to Mr. J. A. Ventin, the new Hon. Secretary, the highest praise must be given for the thorough manner in which the arrangements were conducted.

EYNSFORD.—AUGUST 17TH.

THE Eynsford Cottage Gardeners' and Mutual Improvement Society's annual Exhibition was held on the above date in the beautiful grounds of Lullington Castle, by the kind permission of Sir W. Hart Dyke, Bart. It was a typical village flower Show, but, nevertheless, of an extremely interesting character. True, the display of garden produce could not be compared to that shown at the many large exhibitions which have recently been reported in these pages, but so far as quality was concerned the exhibits were perhaps beyond the standard generally seen on such occasions. The Eynsford cottagers have long been famous for their well-grown vegetables, and the results of this year's labour were no exception to the rule. Possibly we shall not be far from the right track in saying that, in a great measure, the success of the Eynsford cottagers and their Exhibition are largely due to their near benefactors—Messrs. H. Cannell & Sons. This well-known firm has so long been acquainted with everything connected with horticulture that it is not at all surprising to hear of the successful culture of vegetables in the immediate neighbourhood. It was a glorious day for holding a flower Show, and the villagers were quite *en fête*, there being sports and various other entertainments, in addition to the Exhibition.

The collection of vegetables shown by members of various societies in Kent, and grown from seed supplied by Messrs. Cannell & Sons, were the principal features of the Exhibition. Prizes to the extent of £6 were offered by the Swanley firm in this class, and these brought forth some good exhibits. The first prize was awarded to a meritorious collection, comprising Duke of Albany Peas, Cannell's Perfection Potatoes, Cannell's Selected Runner Beans, and Moore's Cream Marrows, all well grown. The name of the winning Society had, however, been cut from the show card for some unexplained purpose. A collection shown by the Milton Horticultural Society (Sittingbourne) was placed second, Broughton Horticultural Society being third. In each case the vegetables were exceedingly good, considering that they were the produce of cottage gardens and allotments.

Potatoes were exceptionally fine in the classes provided for them, affording ample evidence that the soil of Kent is capable of producing fine samples of the popular tuber as well as fruit. Messrs. W. Smith,

C. Smith, and K. Baldwin were the prizewinners in the class for one dish, all showing clean, well-grown tubers. *Magnum Bonums* were very fine and clean, especially those staged by Mr. G. Barclay. Mr. T. Baldwin was first with four dishes, Messrs. Barclay and R. Baldwin being second and third. American Rose, though less popular generally, apparently still remains a favourite with the Kentish cottagers, some grand specimens being staged on this occasion. Mr. K. Baldwin had a remarkably fine dish, for which the first prize was awarded. Peas, Vegetable Marrows, Cabbages, Parsnips, and other vegetables were also of good quality.

Messrs. Cannell & Sons sent various miscellaneous exhibits. These comprised a collection of Cactus Dahlias, the flowers being remarkably fine; a group of foliage plants, amongst which Crotons, Palms, Colcuses, Caladiums, and Ferns were conspicuous; and a number of *Tigridia* blooms, these being most gorgeous, especially *T. pavonia grandiflora*. Messrs. Cannell also showed a brace of their Kentish Hop-pole Cucumber, an appropriate name, considering the length of the fruit.

Honey was shown by various local bee-keepers and by the Kent Bee-keepers' Association. Mr. E. D. Till, Eynsford, staged a hive of working bees as well as supers of honey, and Mr. Wheeler of the same village likewise showed samples of honey made by his bees.

SHREWSBURY.—AUGUST 17TH AND 18TH.

SHREWSBURY at show time presents a sight not soon to be forgotten by visitors whose eyes are not trained to see the extraordinary interest that is taken in the event of the year. The ancient capital of the border county is decorated for the occasion in almost a lavish manner, and not in tawdry style. Train after train brings its thousand and more passengers, taxing the resources of the railway officials to cope with the traffic. The main street from the station to the Quarry Grounds is full of animation by a stream of people who file in at one end and out at the other to the number of some 50,000. The park-like grounds suggest the resemblance to an army encampment, as dozens if not scores of marquees are seen scattered round the noble semicircle, outlined by magnificent Limes, which form a noble skirting boulevard. Many of the great marquees represent the commissariat, for it has to be remembered that an army has to be fed—a civil army of sightseers—that could not possibly be kept civil if hungry. There is no occasion to be hungry at the Shrewsbury Show, and it would be difficult to imagine an equal mass of people better dressed, more orderly, or more intent on obtaining pure enjoyment. The attractions provided are of the best—the best music, at a cost of some £300—the best produce of gardens, involving an outlay of say thrice that amount; then when dusk succeeds daylight the best fireworks follow. Everything that is considered worth doing is done well, and it is the experience of the Committee and the experienced Secretaries, Messrs. Adnitt and Naunton, that the more generous the action the more generous the response.

It may be said the affairs of the Shropshire Horticultural Society are conducted in a statesman-like manner, and with what success the records show. The two gentlemen named have worked together for eighteen years, during which time the Society has attained a position almost, if not quite, unparalleled. Though hundreds of pounds have been spent in improving, furnishing, and beautifying the Quarry Grounds, and transforming a swampy dell into a charming garden, yet the invested capital yields a substantial annual income. The present year was commenced with a fund of over £4000, and tickets to the amount of £700 were sold by the Secretaries in a few days prior to the Show. While, therefore, fine weather is always hoped for and generally enjoyed, ample provision is made for the proverbial "rainy day" that has too often brought weaker societies to the verge of ruin. Last year the receipts of the Shrewsbury Show were £370 in excess of those of any previous season, and the gross profits upwards of £900. It is almost too much to hope that such a result can be exceeded this year, with the outlay greater than ever; but however that may be, the Society rests "broad based upon the people's will," because the policy of the directorate has distinctly won the confidence of the population of the district.

The Show this year was greater than ever, and even better in every department; indeed, it is not too much to say that each section was a show in itself. For instance, if we take the huge marquee that contained the specimen plants and superb groups the mind must travel far to find its equal, and then perhaps fail. Much the same may be said of the cut flowers having regard to their numbers and variety. Fruit was in larger force than ever, and the display of black Grapes has never been equalled at Shrewsbury, nor perhaps excelled elsewhere. Vegetables may, perhaps, fittingly be described as prodigious, and "wonderful, but too large," was the comment of old growers who have more regard to high quality than mere size, yet it must be conceded that not a few of the specimens combined both of those properties, and judges were impelled to observe "there was no getting away from them." Complimentary exhibits were also very numerous, and contributed materially to the general effect. It will be well to point out some of the leading features and indicate the chief prizewinners in the different sections of this really great Show.

PLANTS.

A very large tent was devoted to stove, greenhouse, and other plants, also to the six superb groups staged in competition, each in a space of 300 square feet, for prizes of £20, £16, £14, and £12, and they were grand. Mr. Peter Blair, Trentham Gardens, was well first with a truly artistic group, having a lovely background of Bamboos with a Palm in the centre. In a central small group was a fine *Cocos Weddelliana*,

surrounded by Orchids, Asparagus, and Maidenhair Ferns, and a few small bright Caladiums. Two corresponding groups were near the sides, a Palm in each, and Orchids, and other plants. Several fine plants of *Dendrochilum filiforme* were in raised positions in front. It was altogether an exceedingly well worked-out arrangement. Second, Mr. J. Cypher, Cheltenham, who had a very fine group with *Cattleyas*, *Vanda cœrulea*, and other Orchids, the whole consisting of smaller groups artistically displayed. Third, Mr. C. H. Wright, Halston Hall, Oswestry. Fourth, Messrs. Jones and Sons, Shrewsbury. Extra, Mr. Allum, Tamworth; but, with the exception of the first and second groups, there was an overcrowding of the plants.

In the class for sixteen stove and greenhouse plants, not less than eight in bloom, Mr. Cypher easily won the first prize with grand specimens, in which were very fine examples of *Ericas Austiniana*, *Aitoniana*, *Thompsoni* (a very fine plant), and *obovata purpurea*, *Allamanda Hendersoni*, *A. nobilis* (a grand plant), a very fine *Statice profusa*, *Croton angustifolium*, and *Ixora Pilgrimi*. Second, Mr. W. Finch, gardener to Mr. Alderman Marriott, Coventry, who had fine examples of *Ixora Duffii*, *Dipladenia amabilis*, *Erica Marnockiana* and other plants. Third, Mr. Mould, Pewsey, with smaller but very even and well grown specimens, amongst them being *Ericas Marnockiana*, *œmula*, and a very large *Eweriana superba*, a fine *Statice Gilberti*, and an excellent *Alocasia Lowi*. Mr. Cypher also staged a group of twenty plants, not for competition. In the class for six stove and greenhouse plants, open, equal firsts were awarded to Mr. Cypher and Mr. Finch for two very fine lots. In the former were *Bougainvillea glabra*, *Ixora Pilgrimi*, *Allamanda nobilis*, *Phœnocomia prolifera Barnesi*, and very fine *Ericas Austiniana* and *Marnockiana*. Mr. Finch's included a grand *Ixora Duffii* with twenty-five trusses, and superb *Ericas Irbyana* and *Marnockiana*. Third, Mr. Mould.

For six stove and greenhouse plants, open to gentlemen's gardeners in Salop, first, Mrs. Juson, Shrewsbury; second, Mr. H. H. France, Hayhurst; third, Lord Berwick. Some very fine Ferns were staged. For a group of not less than twenty Orchids, Mr. Cypher was first with about sixty plants, well staged amongst Ferns and other plants. In this group were some choice forms, especially a superb specimen of the very lovely *Sobralia xantholeuca*, of a rich cream colour, with orange centre, flowers large, and of great substance; *Dendrobium Phalænopsis* in variety; *Vanda cœrulea*, superbly flowered; *Dendrobium Deari*, and superbiens; *Cattleyas Dowiana* and *Dayana*; *Oncidium dasystyle* (the Bee Orchid), *Gardnerianum*, *macranthum*, with very large flowers; *Aerides Sanderiana*; *Odontoglossum Harryanum*; and a very fine *Cypripedium grande*. Mr. Blair was second, and in his group were some very fine specimens of *Oncidium macranthum*. Mr. Blair also showed a plant in flower of a fine *Bilbergia*, but it was unnamed.

For four Orchids (Salop only) Mr. A. W. Darby was first, Colonel Lloyd second, and Mr. J. Watson third. For six Palms Mr. Cypher was first, Mr. Marriott second, and Mr. Blair third. His six first-prize *Dracenas* were excellent. Caladiums and Coleus were plentiful and very well grown. There were also some good Fuchsias, especially the first prize four staged by Mr. A. Myers, Shrewsbury, which were well grown and well flowered specimens. The same exhibitor was first in each class for six double and six single Zonal Pelargoniums, superb specimens, not too large, as sometimes seen, but of good size and admirably grown and flowered. The Zonals generally were fine. Some good Begonias were staged, especially Mr. W. Beacall's first prize collection. The gentlemen's gardeners' classes were well filled, Mr. G. Burr taking first prizes for six stove and greenhouse plants and four exotic Ferns. For twelve plants for table decoration, first Mr. Blair, second Mrs. Juson, third Messrs. Pritchard & Son. For fifty miscellaneous plants in 5-inch pots Messrs. Jones & Sons first, General Herbert second, and Mrs. Watkins third.

CUT FLOWERS.

The cut flower section of the Exhibition was a very strong one, larger than usual. For twenty-four Roses, Messrs. Harkness & Sons were first, Messrs. Perkins & Sons second, Dicksons, Chester, third. All were excellent stands for this time of year. Large prizes were offered for collections of Dahlias, and Messrs. Keynes, Williams & Co., Salisbury, were first with a fine display at judging time, but the shields filled with blooms had a wretched appearance in the afternoon through the flowers not being in water. It would be well in the future to stipulate for the flowers being staged in an ample supply of water. Mr. G. Humphreys, Chippenham, showed well, but his arrangement was rather flat. It was neatly set up. His front blooms of Show Dahlias were not so fine as in the Salisbury stand. Third, Messrs. Jones & Sons, with well set up flowers with their own foliage and weak front blooms, but Dahlias staged in this way make a very effective display. In the class for thirty-six Dahlias some very good stands were staged. First, Messrs. Kimberley & Son, Coventry; second, Mr. C. Humphreys; third, Mr. J. Walker, Thame. For twenty-four, Mr. Walker was first, Messrs. Keynes and Co. second, Messrs. Kimberley third. Excellent prizes for a collection of Gladioli brought out only one exhibit from Messrs. Jones and Sons, and a second prize was awarded. There was a very fine display of hardy herbaceous flowers, the silver medal and first prize being awarded to Mr. Michael Cuthbertson, Rothsay, for a well arranged and extensive lot. Second, Messrs. Dickson, Chester; third, Messrs. Harkness & Sons. For twelve bunches for Salopian growers, first Rev. T. M. Bulkeley-Owen, second Messrs. Jones & Sons. Some excellent Carnations and Picotees were staged, Mr. R. Sydenham taking first for twelve Carnations and twelve Picotees; Messrs. Thomson & Co. second for Picotees and third for Carnations; and Mr. A. R. Brown second for

twelve Carnations and third for Picotees; all Birmingham growers. For twelve yellow grounds and selfs, Messrs. Thomson & Co. were well first with a very fine lot of yellow grounds; Mr. A. R. Brown second, and Mr. Sydenham third. Blooms of Mrs. Robert Sydenham, the finest of all the yellow grounds, were prominent in their stands.

The contest for the excellent prizes for a pair of bouquets was a very close one indeed and taxed the Judges, quality and exquisite taste ruling. Messrs. Jenkinson & Son, Newcastle, were placed first with very lovely arrangements. Second, Messrs. Jones & Son. Third, Messrs. Perkins & Sons. Fourth, Mr. Chard, London. Fifth, the Liverpool Horticultural Company. Sixth, Mr. G. Davidson. Three fine epergnes well merited their prizes. First, Messrs. Jones & Son. Second, Mr. Blair. Third, Mr. Keble, Market Drayton. Dinner tables.—First, Mr. J. R. Chard, Stoke Newington, London. Second, Messrs. Jones and Son. Third, Messrs. Pritchard & Sons.

FRUIT.

As has been previously indicated the display of fruit was both extensive and excellent. Superior produce, except perhaps in the white Grape classes, with close competition, prevailed, and many an exhibitor who came with bright hopes of securing a good position in the prize list, was probably taken by surprise when he found what he had to contend against on the long and well-laden tables. Only the more important classes can be particularised, the competition being open to all except where otherwise specified.

Collections.—These came first in the section, and good prizes had the usual effect of insuring good contests for supremacy. In the class for a collection of "twelve dishes, to include two black varieties and two white varieties of Grapes (two bunches of each), one Melon and one Pine; space 12 feet by 4 feet 6 inches," the amounts offered were £10, £6, and £3. Five collections were arranged. Mr. R. Dawes, gardener to the Hon. Mrs. Ingram, Temple Newsam, Leeds, was fortunate in securing the chief position, his magnificent bunches of Gros Guillaume Grapes, no doubt, weighing most heavily in his favour. Such bunches, as combining size, symmetry, and colour of berries, are rarely seen. The collection also contained a very good Alicante, but the white Grapes—Muscat of Alexandria and Buckland Sweetwater—were far from being in the best condition. The Pine, a Queen, was very fine. The remaining dishes comprised a Melon, two Peaches, Princess of Wales and Bellegarde; two Nectarines (well coloured); Roman Apricots, and Green Gage Plums (good).

Mr. W. Iggulden, gardener to the Earl of Cork and Orrery, Marston House, Frome, was a dangerously close second with a really fine collection, probably the best he has staged. The Pine was good, though not equal to Mr. Dawes', but at least three out of the four dishes of Grapes were far better than those in the Yorkshire collection. They comprised the best Muscats in the Show, with Buckland Sweetwater, Black Alicante, and Madresfield Court, all in superb condition. The remaining dishes consisted of grand Peaches, Figs, and Cherries, excellent Nectarines, and Oullins Plums, with good Hemskerk Apricots. But for the "big Grapes" above referred to Mr. Iggulden must have won the first position easily; but no doubt the experienced Judges weighed everything well before delivering their verdict. Mr. J. H. Goodacre, The Gardens, Elvaston Castle, followed very closely indeed for the third prize, staging a good Pine, with Grapes, Peaches, Nectarines, Figs, Cherries, Apricots, and Plums, all of excellent quality. Prizes of £5, £3, and £2 were offered for collections of nine dishes of fruit to Shropshire exhibitors. The first prize was won by Mr. Bremmell, gardener to H. H. France-Hayhurst, Esq., Overley, Wellington, with heavy and good Black Hamburg and fair Muscat Grapes, a good Melon, and creditable dishes of Apricots, Cherries, Peas, and Plums. Second, C. H. Wright, Esq., Halston Hall (Mr. J. Pearson, gardener), Gros Colman Grapes being unusually good in this collection.

Grapes.—Tempting prizes of £10, £6, and £3 were offered for six bunches of black Grapes in three varieties, two bunches of each, splendid competition resulting between eight exhibitors. Mr. J. Bennett, gardener to C. W. Winn, Esq., Rûg, Corwen, well won the first position with magnificent examples of Gros Maroc, Madresfield Court, and Black Alicante. Second, Mr. Hepburn, The Priory, Shrewsbury, with splendid bunches of Madresfield Court, and very good Alnwick Seedlings and Alicantes. Third, Mr. Langley, gardener to Rev. J. M. Bulkeley-Owen, Tedsmore Hall; fourth, Mr. Bannerman, both staging really good examples, much better in fact than we have seen win first prizes at many shows.

Seven exhibitors staged in the class for three bunches of Black Hamburg Grapes. Mr. J. Bates, gardener to T. Harries, Esq., Stone, was the premier exhibitor, with 1½ to 2-lb. bunches of large and well-finished berries. Second, Mr. R. Bramhall, gardener to J. C. Sinclair, Esq., Ravenswood, Rock Ferry, with good and well-shaped bunches of fine berries. Third, Mr. Langley, with larger bunches, but smaller berries. In the any other black variety class Mr. Hepburn was first with splendid Madresfield Courts, Mr. Broomhill a good second with the same variety, and Mr. J. Wilkes, gardener to Mrs. Meaken, Cresswell Hall, Stafford, third out of seven collections.

Mr. J. Crawford, gardener to Col. Thorpe, Coddington Hall, Newark, was first in the class for two bunches each of two varieties of white Grapes with Buckland Sweetwater (clear and good), and fair examples of Golden Queen. Mr. Wilkes second with Muscat of Alexandria and Golden Queen, of fair quality. Mr. G. Middleton, gardener to R. Pilkington, Esq., third, with Muscats and Foster's Seedling. This was not a particularly good class. The last-named exhibitor took the lead with three bunches of Muscats—heavy, full, and fine. Mr. W. Coates,

gardener to H. Verdin, Esq., Darnhall Hall, Cheshire, second, not quite so large in berry, but better finished. Mr. Carr, gardener to Lord Hill, Hawkstone, third with smaller bunches, but very fine berries. In the class for three bunches of any other white varieties Mr. Langley was distinctly first with splendid examples of Buckland Sweetwater; Mr. Wilkes second with large but unshapely Foster's Seedling; and Mr. Crawford third with small bunches but superbly finished berries of Buckland Sweetwater.

In the following county classes for Grapes there was good and creditable competition. Black Hamburgs, two bunches.—First, Mr. G. Dawes, gardener to W. Darby, Esq., Little Ross, with remarkably fine examples; Mr. R. C. Townsend, gardener to Colonel Lloyd, Aston Hall, Oswestry, second, with small but well finished bunches, and Mr. Bremmell a very good third. With two bunches of any other variety of black Grapes the last named exhibitor was first with very good Alnwick Seedling; Mr. Townsend second with Alicante, and Mr. Hughes, gardener to A. H. Boughton Knight, Esq., Downton Castle, third; Mr. T. Smeatlam, gardener to Captain Cunliffe, Leaton Knolls; Mr. Townsend and Mr. Carr were awarded the prizes in the order named for Muscats; Mr. C. Bellis, gardener to Sir C. H. Rouse Boughton, Downton Hall, being first in the class for any other white variety with heavy bunches of Buckland Sweetwater. In the open class for amateurs Mr. S. H. Hall, Rock Ferry, was easily first with black Grapes, excellent Hamburgs; and Mr. G. Burr, in the corresponding white class, with Muscats.

Other fruits.—Peaches were well shown, Mr. Wilkins, gardener to Lady Theodore Guest, Inwood, well winning first honours with a magnificent dish of Sea Eagle. Mr. Wilkes was second with highly coloured Barringtons, and Mr. Blair a very close third. Mr. Barker, Ravenswood, Rock Ferry, had the best Nectarines, highly coloured Elruge. There was a fair display of Melons, Mr. Dawes being first in the Green Flesh class with Eastnor Castle, Mr. Bennett second with Hero of Lockinge. Mr. R. Lawley, gardener to Mrs. Darby, Adcote Park, staged the best Scarlet Flesh, Sutton's Benham Park; Mr. Wilkes following with Sutton's Triumph. The chief prize offered for six dishes of hardy fruits (Apricots, Peaches, Nectarines, and Plums excluded) was won by Mr. J. Pye, gardener to T. Meares, Esq., Clive Hall, with excellent dishes of Apples, Pears, Gooseberries, Raspberries, Cherries, and Currants. Worthily of particular mention in this section of the Show was Mr. P. Blair's exhibit of twelve Queen Pines from Trentham, well developed and perfectly ripe fruits from 3½ to 4 lbs., not for competition, and for which a silver medal was appropriately awarded.

VEGETABLES.

A considerable number of classes and liberal prizes were offered for vegetables, and these attracted some of the most noted exhibitors in the country, a very fine display being made. There were five competitors in the class for twelve varieties, and the Judges experienced considerable difficulty in awarding the prizes. Eventually Mr. W. Pope, gardener to the Earl of Carnarvon, Highclere Castle, Newbury, was placed first; Mr. T. Wilkins, gardener to Lady Theodore Guest, Inwood House, Henstridge, second; and Mr. C. J. Waite, gardener to Col. Talbot, Glenhurst, Surrey, third. The premier collection consisted of Sutton's Imperial Beet, Autumn Giant Cauliflower, Sutton's New Intermediate Carrot, Solid White Celery, Globe Artichokes, Excelsior Onions, Duke of Albany Pea, Ne Plus Ultra Runner Bean, Satisfaction Potato, Perfection Tomato, Prizetaker Leek, and Sutton's Matchless Cucumber, all in perfect condition and very well set up. Eight competed in the class for nine varieties, this being confined to the county of Salop. Mr. T. Smeatham, gardener to Captain Cunliffe, Leaton Knolls, was well first, his collection comprising good Lyon Leek, Autumn Giant Cauliflower, Intermediate Carrot, Windsor Castle Potato, Dickson's Al Runner Bean, Duke of Albany Pea, and Perfection Tomato, all very superior; Mr. J. Damien, gardener to Major-General C. V. Jenkins, was a good second; and Mr. J. Abbott, gardener to Mrs. Guise, a highly creditable third.

All the classes for single dishes and collections of Potatoes were very well filled, but we cannot say the same of the prize cards; these being anything but legibly written in the vegetable classes generally. The best six varieties of Potatoes were shown by Mr. J. Hathaway, gardener to the Earl of Latham, Ormskirk, who had grand dishes of Satisfaction, Snowdrop, Reading Ruby, International, Cole's Favourite, and Alderman. Mr. A. Coombe, gardener to the Earl of Dudley, was a very close second; and Mr. H. Forder, gardener to Col. Cornwallis West, West Lockies, third; a considerable number of other growers staging admirably. With three varieties of Potatoes Mr. A. Coombe took the lead, having perfect dishes of Sharpe's Victor, Edgcote Purple, and Sutton's Perfection. Mr. J. Davies followed closely, and Mr. S. Brunnett was a good third. The entries for a single dish were still more numerous, Mr. A. Coombe winning first prize with a good dish of Satisfaction, Mr. Forder being second, and Mr. C. J. Waite third. Cucumbers were numerous, but not of a very high class. Mr. H. Forder was first with Lockie's Perfection, and Mr. Iggulden second with Improved Telegraph. Tomatoes were fairly numerous, and the quality good, coarse fruit being absent. Mr. T. Pye, gardener to T. Meares, Esq., was first and Messrs. Jones & Sons, Shrewsbury, second; both having good samples of Perfection. Peas were numerous and of great excellence. Mr. R. C. Townsend was first, and Mr. F. Roderick, Chirk Castle, second; while the first prize for Kidney Beans went to Mr. C. J. Waite, Mr. R. Darby being second.

Messrs. Webb & Sons, Stourbridge, offered a series of liberal prizes for a collection of eight varieties of vegetables, and these attracted very close and good competition. Mr. T. Wilkins was first, staging grand dishes

of Ailsa Craig Onion, Autumn Giant Cauliflower, Pearl Celery, Sensation Tomatoes, Ne Plus Ultra Runner Bean, Prodigy Pea, Webb's Defiance Carrot, and Satisfaction Potato. Mr. W. Pope was a very close second, Mr. J. Hathaway third, and Mr. C. J. Waite fourth. Messrs. Webb and Sons also provided good prizes for their Tomatoes, and the variety Sensation was very well shown. Mr. A. Coombe was first, Mr. J. Cranford second, and Mr. C. J. Waite third. Messrs. Sutton & Sons provided the prizes in five different classes. For a brace of Cucumbers Mr. A. E. D. Darby was first for a good brace of Matchless, Mr. H. Forder being second, and Mr. J. Hathaway third. With a dish of Tomatoes the competition was very keen. Mr. T. Pye was first, Mr. C. J. Waite second, and Mr. G. Squibbs third, all having perfect dishes of Sutton's Perfection. The winners with Peas were Messrs. W. Pope, T. Wilkins, and T. Meares, and with Carrots W. Pope and W. Dawes, who took the prizes in the order named. Quite a large number of Melons were shown, Messrs. H. Forder, J. Bates (gardener to J. T. Harris, Esq.), and T. Wilkins taking the prizes as named. Messrs. Carter and Co. provided liberal prizes for their specialities in the way of Beans, Tomatoes and Melons, and these were well competed for, but the names of the respective prizewinners could not be ascertained when this report was taken. Messrs. Thomson & Co., Birmingham, were also donors of special prizes for a collection of six varieties of vegetables, and with these Mr. T. Smeatham was first, Mr. J. Newell (gardener to G. H. Kenrick, Esq.), second, and Mr. Coombs third. Mr. Robert Sydenham, Birmingham, likewise offered prizes for a collection of vegetables, and in this instance and also in the cases of special prizes offered by Messrs. W. Clibran, the Judges overlooked the classes for a considerable time, the judging not being completed when the tents were thrown open to a crush of exhibitors and visitors.

MISCELLANEOUS.

The honorary exhibits staged were of a very meritorious character, and in sufficient numbers to form a fine exhibition by themselves, the local nurserymen always staging fine displays. The following medals were awarded to their exhibits—viz., a gold medal to Messrs. Sutton and Sons, Reading, for a grand display of their new Gloxinias, including Her Majesty, Duke of York, Empress of India, Souvenir de Shrewsbury, and Purple Prince, to which certificates were awarded. A silver medal to the Liverpool Horticultural Company for a superb display of floral designs. Silver medals also to Messrs. Cutbush & Son, London, for a collection of plants; to Mr. B. R. Davis, Yeovil, for Begonia blooms; to Messrs. Hewitt & Co., Birmingham, for a collection of plants and cut flowers; to Messrs. Thomson & Co., Birmingham, for 500 blooms of Carnations and Picotees; to Messrs. Hy. Cannell & Sons, Swanley, for Begonia blooms, Cactus, and other Dahlias; to Mr. Blair, Trentham, for twelve Pines. Bronze medals to Mr. John Price, Rhyl, and Messrs. Lee and Co., Shrewsbury, for collections of fruit; and a special prize to Mr. Wallis, Keele Hall, for five dishes of Figs.

Certificates went to Mr. E. Murrell, nurseryman, Shrewsbury, for a fine lot of Roses, plants, and cut flowers. First and silver medal was awarded last year, and no exhibitor can take one two years in succession, to Mr. Hy. Eckford, Wem, for new Sweet Peas; to Mr. A. Myers, Shrewsbury, for a collection of plants; to Messrs. Birkenhead, Sale, for new and rare Ferns (medal last year), also to Messrs. Kelway & Son for a very fine collection of Gladioli (medal last year), but first class certificates also to new Gladioli, Sarah Bernhardt, Unionist and Nautch Girl; to Messrs. Dicksons, Limited, for plants and cut flowers; to Messrs. Keynes, Williams & Co., for new Cactus Dahlia Mars; to Messrs. Sutton and Sons, for new winter blooming Begonias; to Mr. Charles Turner, Slough, for Carnations and Picotees; to Mr. Hy. Pattison, Shrewsbury, for Violas; to Messrs. Thomson & Co., Birmingham, for seedling salmon self Carnation Mrs. J. Chamberlain.

Amongst Messrs. Cannell & Sons' new Cactus Dahlias the following were very fine and distinct:—Ernest Cannell, bright orange; Robert Cannell, bright carmine rose; Mrs. Douglas, shaded fawn and rose, and bright; Duke of Clarence, shaded crimson, all of the Juarez type, and with these was Canna Louise Chrétien, orange, beautifully spotted with brownish red.

On the first day 15,000 persons were present, and over 40,000 on the second. The great Exhibition is admirably managed by Messrs. Adnitt and Naunton, the Hon. Secretaries, and the Committee had the work ready for the Judges soon after ten o'clock.

CARDIFF.—AUGUST 17TH AND 18TH.

THE annual Show of this Society was held at Cardiff on the above dates, and was admitted on all sides to be the best ever held in the town, if not in South Wales. The district is well suited for the growth and maturing of fruit, vegetables, and flowers, and it is evident that the art of culture is being better attended to year by year. The exhibits were set out in a series of eight or nine large tents, arranged within the Sophia Garden, the lawn of which afforded most grateful walking ground for visitors, while the avenues of well foliaged trees furnished delightful shade, which was much appreciated in the sunshine and heat with which the Show was favoured.

The tent set apart for the open classes, where the competition was practically limited to nurserymen, proved a great attraction to connoisseurs. The principal honours in this department were carried off by Mr. Cypher of Cheltenham. In the class for twelve stove and greenhouse plants he was first with very fine specimens of *Ixora amabilis*, *Franciscea calycina* major, *Allamanda Hendersoni*, *Erica Uriana*, *Clerodendron Balfourianum*, *Anthurium Andreanum*, *Erica Jacksoni*, *E. Marnockiana*, *Stephanotis floribunda*, *Rondeletia speciosa* major,

Ixora Pilgrimi, and *E. Austiniana*. These plants were compact in growth, thoroughly flowered, and in the best condition possible. Messrs. W. Heath & Son, Cheltenham, were second with good plants of *Allamanda grandiflora*, *Statice profusa*, *Phenocoma prolifera* Barnesi, and similar plants of other varieties. In the class for eight fine-foliaged plants Mr. Cypher's first prize collection embraced splendid plants of *Croton Chelsoni*, *C. Newmani*, *Dasyllirion acrotrichum*, *Pritchardia pacifica*, *Kentia Belmoreana*, *K. australis*, and *Cycas revoluta*. Messrs. Heath & Son were second with large plants, principally Palms and Crotons.

In the class for six Fuchsias, Mr. T. Clarke, gardener to Col. Sir E. Hill, Cardiff, was first with magnificent plants in fine bloom, comprising *Beaconsfield*, *Display*, *Mrs. Rundell*, *Charming*, *Thomas King*, and *Rose of Castile*. The second prize specimens, exhibited by F. Hillard, Esq., Cardiff, were good, but not of such fine varieties. For six Zonal Pelargoniums Mr. Hillard was first with large, well-flowered, flat-foliaged plants, perfect in foliage, the varieties being *Mark Twain*, *Madame Leon Dolloy*, *F. V. Raspail*, *Eureka*, *Wonderful*, and *Minnie Parker*. Mr. T. Clarke was second with similar plants but not quite so well flowered. For eight exotic Ferns, Mr. Malpas, gardener to Mr. C. E. Jenkins, Pen-y-lan, Cardiff, was first with excellent plants of *Adiantum cuneatum*, *A. cardiochloena*, *A. gracillimum*, *A. amabile*, *Gymnogramma chrysophylla*, *Woodwardia radicans*, *Davallia Mooreana*, and *Dicksonia antarctica*. Mr. Clarke was second. With twelve Begonias (Tuberous), Mr. Jenkins was first, having a fine assortment of singles and doubles, and Mr. Evan Lewis, Llandaff, was second with plants little inferior to the others.

Mr. Cypher was first with four Orchids, having good pieces of *Cattleya Gaskelliana*, *Odontoglossum Harryana*, *Cattleya gigas*, and *Phalenopsis Schröderiana*, and Messrs. Heath & Sons second.

In the tent for plants confined to amateurs a large number of excellently grown specimens were shown. In the class for four stove or greenhouse plants in bloom, distinct varieties, there was good competition, and Mr. Jenkins was first with evenly balanced plants of *Plumbago capensis*, *Clerodendron Balfourianum*, *Allamanda Hendersoni*, and *Vallota purpurea*. Mr. Currey, Salisbury, was second with good plants. For four fine-foliage plants Mr. A. Pettigrew, gardener to the Marquis of Bute, Cardiff Castle, was first with *Cycas revoluta*, *Croton interruptum*, *C. majesticum*, and *Phoenix compacta*. Mr. Jenkins was second; and Mr. Hockey, gardener to Col. Page, third. For four Fuchsias Mr. Hillard, sen., was first with large well-flowered plants; and Mr. T. Clarke second.

An interesting and successful feature in the plant department was the tent containing the groups of miscellaneous plants arranged for effect, occupying spaces of 100, 50, and 25 square feet respectively. The 100 feet groups were arranged in circular form down the centre of the tent, and the 50 feet and 25 feet groups were placed along the sides. Of the half dozen 100 feet lots the first prize was awarded to that of Mr. Currey, Salisbury, which was a very neat low group of plants, many of them being common hardy border flowers, such as *Liliums*, *Gladioli*, *Campanula pyramidalis*, with *Crotons*, *Orchid*, and *Maidenhair Fern* for a groundwork. The group was light and open, and every plant was shown well. The second prize was awarded to Mr. Case, florist, Cardiff, for a very neat group, made up of *Palm* in the centre, with *Maidenhair Ferns*, *Caladiums*, *Crotons*, *Cockscombs*, and other plants. For the groups of 50 feet Mr. Clarke was first with a handsome arrangement, consisting chiefly of *Crotons*, *Oncidiums*, *Gloxinias*, and *Tuberous Begonias*, edged with *Maidenhair Fern*. Col. Page was a good second, and Mr. A. Pettigrew third. In the group of 25 feet Mr. C. Waldron, Llandaff, was first with a bright little group, consisting of *Coleus*, *Dracæna*, and *Caladiums*, lit up with flowering plants of *Tuberous Begonias*, *Gloxinias*, &c. Mr. Evan Lewis was second with a group consisting chiefly of flowering plants; and Mr. Marcus Gunn, Llandaff, third. The silver medal for the exhibit showing the highest cultural skill was awarded to Mr. A. Pettigrew for his 100-feet group, which was made up of valuable plants, though less showy in the mass than some of the others. The groups altogether made a splendid display, and were much admired by non-professional visitors and gardeners.

In the department of cut flowers the Show was of marked excellence. The Roses in the open classes were a feature in themselves, such as we have rarely witnessed. Mr. Stephen Treseder, nurseryman, Cardiff, who literally swept the boards in all the classes, was awarded the premier prize for twelve H.P. distinct varieties, three blooms of each, with a stand comprising *Mrs. John Laing*, *Duke of Wellington*, *Dr. Andry*, *Earl of Dufferin*, *La France*, *Auguste Rigotard*, *Victor Hugo*, *La Duchesse de Morny*, *Silver Queen*, *A. K. Williams*, and *Charles Lefebvre*. Messrs. D. & W. Croll, nurserymen, Dundee, who have established a reputation as Rose growers in the north, were second with a good stand, but the flowers were lacking in size and colour. Mr. Treseder's first prize stand of Tea Roses were splendid. It is rarely that such perfect blooms are to be seen at this season, and many of the individual flowers were amongst the best seen this year. The varieties were *Marie Van Houtte*, *Madame Lambard*, *Francisea Krüger*, *Hon. Edith Gifford*, *Comtesse de Nadaillae*, *Ernest Metz*, *Souvenir de S. A. Prince*, *Anna Ollivier*, *Madame Hoste*, *The Bride*, *Catherine Mermet*, and *Innocente Pirola*. The English Fruit and Rose Company (Cranston, Limited), Hereford, were second with a very fine stand, in which the blooms were smaller and rougher. Mr. Treseder's first prize stand of twenty-four H.P. Roses were as follows:—*Countess of Oxford*, *Duchess of Bedford*, *Heinrich Schultheis*, *D. Lamy*, *La France*, *Ulrich Brunner*, *Mrs. John Laing*, *Alfred Colomb*, *Général Jaqueminot*, *Marquise de Castellane*,

Marshal P. Wilder, Dr. Andry, Prince Arthur, Duchess of Albany, Charles Lefebvre, Duchesse de Morny (perhaps the weakest flower in the stand), John Stuart Mill, Lord Macaulay, Baron Hausmann, Prince C. de Rohan, Marie Baumann, Mons. E. Y. Teas, Merveille de Lyon, and Madame Victor Verdier. In this class Mr. Ralph Crossling, nurseryman, Penarth, was second with blooms little inferior to those in the first prize stand. For eighteen Tea Roses Mr. Treseder again took the leading position, and Mr. Crossling was second.

The boxes of annuals and perennials were exceedingly good. In the amateurs' classes the Roses were of fair quality, as were also the Dahlias, Asters, &c. A special note may be made of the twelve bunches of annuals, for which Mr. A. Pettigrew took the first prize with a beautiful stand, embracing *Zinnia elegans*, *Centaurea Cyanus*, *Malope grandiflora*, *Bartonia aurea*, *Calliopsis Drummondii*, *Phlox Drummondii*, *Godetia Whitneyi*, Sweet Peas, purple Candytuft, Iceland Poppy (though a perennial it is grown and treated as an annual), dark dwarf Scabious, and mixed *Salpiglossis*. Mr. Woodgate, Cardiff, was second. In the class for twelve bunches hardy herbaceous perennials Mr. Sheering, Llandaff, was placed first with a stand embracing Roses, Dahlias, Lilliums, *Helianthus*, *Gaillardia*, *Pyrethrum*, *Coreopsis*, *Gladioli*, Iceland Poppies, two bunches of Carnations, and Everlasting Peas. The collection to which the second prize was awarded contained Roses and Hydrangea. It is not often that judges make such a slip as to pass Roses and Hydrangeas as herbaceous plants, and we understand a protest has been lodged. Messrs. Clibran & Son, nurserymen, Manchester, showed an excellent collection of cut herbaceous flowers, amongst them being the new *Tropæolum* Mrs. Clibran, which was much admired. The Judges awarded a high commendation for the collection. Visitors were much interested in the competition for dinner table decorations. Tables 8 feet by 4 feet were completely arranged with fruits and flowers, and laid for eight persons. The first prize was awarded to Mr. Phelps, florist, Cardiff. The wreaths, crosses, and bouquets showed an immense advance on those that used to be exhibited a few years ago. They were really splendid. Mr. A. Ellis, Mr. Case, Mr. W. Treseder, and Mr. Philips were the principal prizetakers.

The fruit tent was one of the best in the Show. Taken as a whole the exhibition of fruit for extent and quality has never been equalled in Cardiff. The Grapes formed a magnificent class. We may have seen even this season better single bunches than any that were in the Show, but in the large collection, which covered two tables the whole length of the tent, there were few inferior lots, and many of great excellence and in splendid bloom. Amongst the principal prizetakers were Mr. T. M. Franklin, St. Hilary, near Cowbridge; Col. Gaskell, Caerleon, Mon.; Mr. C. A. Hywood, Penarth; Mr. Vincent Stuekey, Langport; Capt. Marling, Lydney; and Miss Pieton, Taberville, Ewenny Priory. The pot Vines, for which Mr. A. Pettigrew was awarded first prize with their hanging bunches of well coloured fruit, excited much interest. The Melons were very good. The prize for the best flavoured fruit was awarded to Mr. James Lloyd, gardener to Mr. Vincent Stuekey, for a handsome Melon of his own raising, a cross between Hero of Lockinge and Longleaf Perfection. It was one of the best we have tasted this season, and no doubt will come to the front.

It is evident that the visit of the British Fruit Growers' Association to Cardiff last year has given an impetus to hardy fruit growing in the district, as there was strong competition in all classes. In the class for culinary Apples there were seventy-two dishes shown, and the first prize was awarded to Colonel Page's exhibit, which comprised Peasgood's Nonesuch, Emperor Alexander, Nelson's Glory, New Hawthornden, South Carolina Pippin, and Lord Suffield. Seventy-six competed in the class for dessert Apples, and Colonel Page was again first with Worcester Pearmain, Early Harvest, Duchess of Odenburg, Early Transparent, Irish Peach, and Early Margaret.

Vegetables in the open classes were splendid, Potatoes, Turnips, Carrots, Onions, Leeks, Cauliflowers, and Scarlet Runners being particularly good, and not much inferior were the lots shown in the cottagers' tent, which was filled with most meritorious collections of all sorts of vegetables, such as probably could not be surpassed in any cottage competition in the kingdom.

BASINGSTOKE.—AUGUST 18TH.

THIS North Hampshire Exhibition was held in the splendidly timbered area of Hackwood Park, situate about a mile from Basingstoke, the grounds being generously placed at the Committee's disposal by Charles Hoare, Esq., who is at present occupying this noble demesne, but which is the property of Lord Bolton. Everything looked full of promise for the Show, for the opening weather was delightful; but later rain began to fall, and it came down mercilessly until late at night, totally destroying all hope of a financial success, and it was all the more deplorable, not only that this was the third consecutive wet Show day, but also that in the adjoining town business was suspended at two o'clock to enable everybody to visit the Show. As it was the Committee, finding the intending visitors could not come, broke up the Show early, and the exhibits were loaded and gone an hour before the usual time.

As to the Show itself, it was one of the best perhaps the Society has held, for if some plants were wanting, other objects were superior. In the class for twelve stove and greenhouse plants, Mr. Bowerman, gardener to C. Hoare, Esq., Hackwood, was well first, for his exhibits were good and clean. His flowering plants were *Allamandas cathartica* and *Wardleana*, *Clerodendrons Balfourianum*, *Thompsoni*, and *fallax*, *Bougainvillea glabra* and *Dipladenia boliviensis*; and his foliage plants

were a fine *Alocasia*, two good *Crotons*, and two good *Palms*. Mr. Russell, gardener to W. Bradshaw, Esq., Audley, was second, having a fine *Eucharis amazonica*, and *Clerodendron fallax*. The latter was a good first with twelve specimen flowering plants, having a splendid *Eucharis* carrying thirty heads of bloom and fully seventy expanded flowers. Mr. Bowerman was second with a capital *Allamanda Hendersoni*. The latter was first with a specimen foliage plant, having a superbly coloured *Queen Victoria Croton* 5 feet across. Mr. Weaver, gardener to W. P. Gilchrist, Esq., Oakley Hall, was first with six foliage plants, and Mr. Russell was second. Mr. Weaver was first also with six Ferns, very fine clumps of *Adiantum gracillimum*, *concinnum latum* and *colpodes*, *Pteris longifolia*, *Alsophila excelsa*, and *Asplenium bulbiferum*. Mr. Kneller, gardener to W. Portal, Esq., Malshanger Park, had the best six hardy Ferns; Mr. A. Tripp, gardener to Mrs. Field, Goldings, being second. The decorative groups are always a strong as well as severely contested class here, but one old competitor has fallen out. On this occasion the contest chiefly laid between Mr. Weaver, who has frequently been first, and Mr. Bowerman, and although matters were pretty even on this occasion, yet Mr. Weaver had rather the best arrangement and was placed first, Mr. Bowerman second, and Mr. Southcote, gardener to Captain Oldfield, third. Generally the competitors had too many top or dress plants. Rather fewer of these and more attention to perfection in carpeting the base would improve the groups. *Fuchsias* from Mr. Russell were very fine, being noble pyramids 8 feet in height. They were Charming, Princess Victoria, Venus de Medici, and one unnamed. Mr. Weaver had the best four Zonal *Pelargoniums*, fine plants of Mrs. Gladstone, F. Barton, Constance, and Muriel. Mr. Southcote had the best four *Coleuses*, fine 6 feet pyramids, well foliaged and coloured. Mr. Holloway had the best twelve stove and greenhouse plants in another class, and the best six clumps of *Achimenes*, but we cannot notice other plant classes. Cut flowers were very good, the dressed stands from Miss Owen, Basingstoke, and Miss Flight were charming. Mr. Flight had the best twelve Dahlias, and also twelve Roses, whilst Mr. Kneller had the best Quilled Asters, and Mr. Munday the best French Asters.

Fruit was very good, the best collection, comprising good Muscat of Alexandria and Black Hamburg Grapes, Dymond Peaches, Humboldt Nectarines, Turkey Figs, Melons, Apricots, and Plums, was set up by Mr. Bowerman; Mr. Osman, gardener to L. J. Baker, Esq., Obertsey, coming second. Mr. Osman had the best black Grapes in good Hamburgs, and Mr. Bowerman in the any other black class was first with excellent Gros Maroc; Mr. Osman being second with Alicante. The latter was first in whites with Muscat of Alexandria and in another class with Buckland Sweetwater. Mr. Best, gardener to Mrs. Chate, The Vine, had the best Melons in both classes; very good flavour, a long way before some of the wretched new ones put in for certificates. Mr. Bowerman had beautiful Peaches in *Violette Hâtive* and the best Nectarines in Pineapple. Mr. Best had good Apricots in Moor Park, and the three best cooking Apples in Lord Suffield, Warner's King, and New Hawthornden. Mr. Kneller was first with dessert varieties, having Beauty of Bath, small but very handsome; Red Astrachan, and Mr. Gladstone. Mr. Bowerman was first with Plums, having Washington, Early Orleans, and Belgian Purple. Mr. Kneller had the best twelve Tomatoes, very handsome; but in another class some large ungainly fruits were unaccountably placed first. Cucumbers Sutton's Matchless were capital shown by Messrs. Russell and Bowerman.

Very beautiful indeed were the nine dishes of Potatoes shown by Mr. Lye, gardener to W. H. Kingsmill, Esq., Sydmonton Court. These were in the very best exhibition form, and comprised Mr. Bresee, Prizetaker, Reading Russet, Vicar of Laleham, Puritan, Victory, Windsor Castle, Lord Tennyson, and Satisfaction. Mr. Lye was also first in Messrs. Sutton & Sons' class for six vegetables, having very fine Autumn Giant Cauliflowers, Satisfaction Potatoes, very handsome Excelsior Onions, Duke of Albany Peas, Solid White Celery, and Tomatoes. Mr. Bowerman was second, but was first in the Messrs. Webb's class, also for six vegetables, having very large Ailsa Craig Onions, Cauliflowers, Matchless Carrots, Sensation Tomatoes, Satisfaction Potatoes, and Duke of Albany Peas. Mr. Lye was second. Mr. Lye was first in a similar class for prizes given by Messrs. Jas. Carter & Co., having here handsome Potatoes, The Canon, with other vegetables. Messrs. Sutton & Sons of Reading exhibited a fine collection of *Gloxinias*, including the beautiful white Her Majesty. Mr. Phippen of Reading also sent a pretty group of ornamental plants, with wreaths and other floral devices. Messrs. Cannell & Sons sent bunches of their new Cactus Dahlias.

The Judges and Committee partook of an excellent luncheon, generously provided in the fine dining-room of the mansion, during the day, Mr. Kingdon, ex-Mayor of Basingstoke, presiding in the unavoidable absence of Mr. Hoare.

NATIONAL CO-OPERATIVE.—AUGUST 20TH.

THIS year's great gathering of co-operators at the Crystal Palace on August 20th was as imposing as ever in its main features, but the horticultural Exhibition appeared to be hardly so extensive as usual. Whether the season has proved too adverse, or there are other causes at work, it is impossible to say; certainly there did not appear to be quite so much competition as usual. Whether this impression be an accurate one or not—and it is a point that statistics may be left to settle—there is no falling off in the quality of the exhibits; on the contrary, it is gratifying to note a decided advance on former years in this respect. Vegetables in particular were better than they have ever been shown before at these gatherings, which shows that the

co-operative cultivators are profiting by experience. A lack of cleanness was still observable in the case of a few kinds, but in the majority there is all-round high quality to record.

It would not be of much interest to give full details of the awards, as the exhibitors are mostly cottagers; but it may be of interest to indicate a few points in connection with the exhibits. Beans taken as a whole were excellent, Runners being very good, French creditable, and Long Pods moderate. Beet was mostly of high quality, but some of the roots were coarse and fibry. Cabbages were very good indeed, including red varieties. Carrots were extremely good, the Horn varieties being perhaps the best. The prize exhibits of Intermediate were excellent. Cauliflowers were very fine, though perhaps a little inclined to coarseness. Celery was very good as a whole, and there were some fine sticks included, showing that some of the cottagers understand the culture of this useful vegetable as well as anyone. Cucumbers were extensively and well shown. Leeks were not large, but well blanched. Cos and Cabbage Lettuces were only fair on the whole, lacking cleanness. Of Onions there was an extensive display, which included some very good produce. In Parsnips there was an inclination to coarseness, but Peas were splendidly shown. There were scores of dishes, and many of the pods were very fine indeed. Potatoes were divided into four classes, white and coloured kidneys and white and coloured rounds. There was an enormous quantity of them, including some very fine dishes. It is noteworthy that the exhibitors have secured some of the leading show varieties. Radishes and Shallots were fair, Tomatoes and Turnips very good; the former, though not sensational, being of satisfactory average quality. There was an enormous number of Vegetable Marrows, and as a whole they were excellent.

Fruit was hardly so well shown as usual, but the season is rather late. Small fruits were fair, Plums good. There was as usual a very extensive display of cut flowers. Taking into consideration that the greater bulk of the produce has been grown by cottagers, the Show must be classed as an excellent one. There was a large attendance on the opening day, when many special attractions were added to that of the Show. The arrangements were well carried out by Mr. W. Broomhall. The Managing Director, Mr. Edward Owen Greening, who has been the leading spirit in these great gatherings, continues to manage them with his usual tact and energy.

FRUIT FORCING.

Pines.—*Potting Rooted Suckers.*—Those obtained from the summer-fruiting plants and potted some little time ago will soon be ready to shift into larger pots. It is well, however, to divide the plants into two batches; one, the strongest, should be shifted into their fruiting pots as soon as ready, employing 10 or 11-inch pots, according to kind; the smaller size for Queens, affording them a position near the glass in a light airy house, where they can be kept gently growing through the winter. The plants treated in that manner will be readily excited into fruit next May or June, and will afford a good successional supply of ripe fruit in late summer or early autumn. The other plants—suckers from the summer fruiterers—not large enough to shift into fruiting pots winter best in 7 or 8-inch pots, transferring them to larger ones as soon as ready in spring, with suckers of Smooth-leaved Cayenne that were started last March, will afford a successional supply of ripe fruit through the winter months.

Re-arranging Plants.—About this time a re-arrangement should be made in order to secure the best conditions for them, separating the non-fruiting from the fruiting, as many of those started from suckers of last summer's fruiting plants will have fruits swelling. These must have the best position possible, so as to insure the fruit finishing well. Those plants not fruiting will have completed their growth, and should have air very liberally for the next six weeks, when the temperature exceeds 80°, maintaining the bottom heat steady at 80°, and all well-established well-rooted plants should have a bottom heat of 80° to 85°. Recently potted suckers, or those not having roots well established in the fresh compost, should have a bottom heat of 90°, so as to accelerate the free emission of roots.

Fruiting Plants.—Moderate atmospheric moisture is essential to the swelling of the fruit, but a close atmosphere unduly enlarges the crowns, and the sun acting powerfully on the fruits while damp, causes their discolouration; therefore admit a little air at the top of the house early in the morning, so as to allow of any superfluous moisture escaping before the sun's rays act powerfully or directly upon the fruit. Any fruit it is desired to retard should be moved to a cool or shady house, affording abundance of air.

Figs.—*Earliest Forced Trees.*—The earliest trees in pots may be placed outside if the wood be ripe; but if there is any doubt about it the trees must be continued under glass with a free circulation of air. These are matters on which the cultivator will need to exercise judgment. In either case the trees must not suffer for water at the roots, and any roots that have extended beyond the pots should be cut off, affording water only to keep the foliage fresh.

The earliest forced planted-out trees will now be ripening their wood, and watering may be discontinued, air being given very liberally. If, however, the second crop is not yet ripened moderate moisture in the soil will be necessary, with a free circulation of air to insure high quality in the fruit. When the fruit is all gathered the wood not further required should be cut away in favour of the successional growths, and these being allowed to point towards the light will become well matured at their extremities, which is vital to a full first crop another season.

Trees Unsatisfactory.—If any of those planted out in houses grow too rampantly, and produce thin crops in consequence, root-pruning should be resorted to, and the roots confined to a narrow border from 3 to 4 feet in width. But to secure a first crop of fruit another season it is necessary to accelerate and thoroughly ripen the wood. Trees, therefore, which are unsatisfactory in cropping, should have a trench made as deeply as the roots at a distance of 3 or 4 feet from the stem, and all the roots being detached, the tendency to a late growth will be checked, and the vital forces will be concentrated on the growths, so that the wood will ripen, particularly if the growths are thinly disposed, and the points of the shoots, instead of being very closely tied in, are allowed to grow up to the glass. This will induce the formation of embryonic Figs instead of wood buds, and should be attended to as soon as the fruit is gathered. The trees may be lifted as soon as the leaves give indications of falling, replanting in fresh soil. If the drainage be defective, place in 12 inches of rather rough brick rubbish, and a 3-inch layer of the rougher parts of old mortar rubbish, using the finer parts for mixing with the compost. This may consist of turfy loam of a calcareous nature, or have one-sixth of old mortar rubbish mixed with it, and in replanting ram the compost, thoroughly incorporated, well amongst the roots, for short-jointed wood cannot so well be secured by other means as by a compact soil. The border should be 24 inches deep, or, if the trellis space is small, the width or depth of the border should be proportionately less. Where the drainage is efficient and the border in good order, it will only be necessary to confine the roots to the narrow border, removing some of the old soil from amongst the roots, relaying them in fresh loam, or the old, with an addition of old mortar rubbish, well solidified.

Late Houses.—The fruit on trees in wall cases ripens about this time and in September, and is generally superior to outdoor fruit, which is seriously hampered by wet in some seasons at the time dryness is necessary to secure high flavour and keep the fruit from decaying. In a large house, and with the roots confined so as to secure sturdy, thoroughly solidified and well ripened growths, Brunswick is a very fine Fig, but it grows too luxuriantly for small houses. Similar remarks apply to Negro Largo, which is a very fine large fruit of good quality, and succeeds Brunswick. White Marseilles precedes Brown Turkey in ripening. These are the best Figs for general purposes, and when well grown and ripened are excellent in quality. The great point to aim at is sturdy growths, which are best secured by keeping them thin, and the roots restricted to a border of compact materials. Unless thoroughly solidified growths are made, with short-jointed and well ripened wood, it is useless expecting abundant crops of fine fruit. Keep up a circulation of air constantly, expose the fruit as much as possible to the sun, but if red spider be troublesome syringe on a fine morning after a close picking of the fruit, and afford no more water at the roots than sufficient to keep the foliage in health. If the trees are too luxuriant and the wood does not ripen well treat them as advised for unsatisfactory trees.

Melons.—*Plants in Houses.*—As the days are shorter lessened supplies of water will be required, yet give sufficient to keep the soil in a moist condition whilst the fruit is swelling. After it has ceased swelling afford no more water than suffices to prevent the foliage flagging. Keep the laterals stopped to one leaf of successional growth, rub off all superfluous shoots as they show, thin the laterals where too crowded, not allowing these to interfere with the principal leaves or to retard the swelling of the fruit. Plants with fruit advanced for ripening should be kept drier at the roots and have air liberally, avoiding a close atmosphere, as that frequently results in the fruit cracking and generally causes the flavour to be inferior. The night temperature should be maintained at 65° to 70°, 70° to 75° by day artificially, and 10° to 15° rise from sun heat.

Latest Plants in Houses.—In some establishments the latest batch of plants are not put out until the end of this month or the beginning of next to afford a supply of fruit about Martinmas, but the plants are generally strong from a late July sowing, and fruit with little delay. They are usually trained with a single stem two-thirds up the trellis without stopping, and every other lateral being rubbed off on opposite sides of the stem fruit is shown freely on the first laterals at the second or third joint. By carefully fertilising the pistillate with the staminate blossoms the fruit sets freely in a rather dry and warm atmosphere, and by afterwards maintaining a temperature of 70° to 75° by artificial means the fruit swells rapidly, the bottom heat being kept steady at 80° to 85°, and the atmosphere moderately moist. Excessive moisture, however, is apt to cause the plants to canker at the collar and in the stem, and must be guarded against, rubbing quicklime into any affected parts.

Plants in Pits and Frames.—The latest plants have the fruit set and swelling freely, and will be better for good linings, so as to insure steady progress and the free admission of air. Those in hot-water heated pits will be the better for a gentle warmth in the pipes on cold nights and dull wet days. Gentle heat affords facilities for ventilation,

a little being given to insure evaporation and the consequent elaboration of the sap. The plants may be sprinkled over the foliage early on fine afternoons, avoiding the stems or collars, and closing before the temperature has receded to 80°, so as to raise the temperature to 90° or 95°. Admit a little air at 75°, increase it with the increasing sun heat, and keep through the day at 85° or 90° by that means. Employ coverings over the lights on cold nights.

THE BEE-KEEPER.

APIARIAN NOTES.

FERTILE WORKERS—WHAT ARE THEY?

SOME people deny the existence of fertile workers, others say that workers develop their reproductive organs when in their adult state and become egg layers, while others assert that some bees, if not all of them, have the power of mating. All of these propositions are errors. No worker bee is capable of mating, and no one has the power of developing her reproductive organs while in the pupa state nor after she has crept from the cell. It is the food given by the nurse bee and the location of heat, together with the enlarged cell, and these things only, that give the insect, whether queen or worker, the power to lay eggs. The most conclusive proof, and a beautiful example of a fertile worker proper, was an Italian Alp bee, bred contiguous to a queen cell, the two being the only ones in the piece of comb given to a queenless hive of bees, the queen in this case being lost. The bee laid eggs that produced beautifully marked Italian drones. I watched this bee after receiving court from the other bees and depositing eggs.

Queens, perfect and imperfect, but which are drone-producers, are termed by some of our modernists fertile workers, which is also an error. Many imperfect queens have little resemblance to perfect ones, but have all, more or less, the distinguishing marks, although not highly developed. Fertile workers proper in no respect resemble queens. Some imperfect queens mate like perfect ones, although in appearance they are, to casual observers, workers only; but these queens never survive long while others never seek to mate, and often begin laying eggs shortly after birth. I had several of that sort this year. One very puny young queen might easily have been passed over for a worker amongst them, for she could scarcely be distinguished, and years ago I had similar experience.

All the queen cells raised by drone-producing queens or fertile workers produced nothing but drones, the cells of which could not be detected from queen cells. The foregoing is the result of my experience and observation. Will "Hallamshire Bee-keeper" explain how a worker bee can become a producer of worker bees and queens?

THE HEATHER-VOLES.

I am now at the Heather with my bees anxiously waiting for some sunshine to open the Heather, which, owing to the rainy season, is very late, and to the destruction by the voles, is not fine this year. It is scarcely worth repeating, but when we see teachers telling the people that rain is good for producing fine Heather it is the weak link we judge them by. The voles spoken of are very destructive to pasture of all kinds, and large tracts of Heather are spoiled by them. Cats and dogs that eat them become diseased, which I am inclined to think arises from the formation of the indigestible fur; but not having my microscope at hand I could not examine them closely. The head is large, the hind feet have five, and the fore ones four, toes; the tail is short. With such traps as were noticed in your columns lately the country could soon be rid of them. They migrate readily to places of plenty and comfort. Although the papers made a burlesque of catching a number in a short time in a bottle thrown by accident upon the line, it was a valuable hint for exterminating pests. Voles are getting more numerous every year, and as they take to the water readily they may become a pest in more ways than one.—
A LANARKSHIRE BEE-KEEPER.

PRODUCING BETTER BEES.

I HAVE been quite interested in Mr. Giles' suggestions about obtaining a better bee by crossing some of the different races or varieties now known to us.

The so-called Punic or African bee, if it possesses even a part of the good qualities ascribed to it, might perhaps be crossed in the Italians, so as to give us substantially a new variety having the desirable qualities of both its parent races.

What friend of the Italians would not be overjoyed if he could give to them the same readiness (I might even say eagerness) for working in supers so characteristic of the black or German bee, and the same power of sealing over their honey with such exquisitely white cappings? Yet nothing of this kind has been brought to pass, in spite of innumerable crossings between the two races.

Those who have read my observations on the only colony of Punic bees I have yet seen, know that I certainly found in them some peculiarities which do not belong to the common black race, and I would advise those who have crosses between the yellow varieties and these bees to give them the closest attention.

I cannot agree with Mr. Giles that there is any promising outlook for breeding a race of stingless bees. Rats, mice, and most of the vermin race love honey, so do birds of various kinds, and bipeds of the human kind are often tempted to steal it.

Now what defence could such a puny insect as a honey bee make against the vast hosts of its sweet-loving enemies if it had not such a formidable weapon as its venomous sting?

A little time spent upon pondering this question would soon satisfy anyone that we are never likely to see a stingless race of honey bees.—L. L. LANGSTROTH, *Dayton, Ohio* (in "The Apiculturist.")

TRADE CATALOGUES RECEIVED.

* * * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Photographs (W. G. G.).—We have received three photographs. Please send us a few particulars about them.

Sweet Mace (Mace).—The flowering specimen arrived as we were preparing for press, and after the insertion of a note on the subject in another column, which see.

Heating with Gas (S. J. A.).—We have not taken any records relative to the consumption of gas for heating glass structures. Something depends on the apparatus, and a good deal on the burner. Though no one can state with any precision the cost of heating a house without knowing its height, as well as other dimensions, also the area of glass exposure, we publish your letter in another column in case any of our readers can give information, founded on practice, on heating with gas.

Grubs and Endive (Bob Smith).—You cannot do better than remove the soil from around the plants, and spread round them in its place a good thickness of wood ashes and soot. Watering with a mixture of soapsuds and petroleum is said to act as a deterrent, about a wineglassful of the oil in 3 or 4 gallons of the suds, stirring well at the time of using, and not pouring it over the leaves. A heavy dressing of lime would do your land good, or a light one of gas lime, but you had better write for particulars later in the season.

Apple Tree Cankered (*A. M.*).—The branches are seriously affected with canker. The roots of the tree are in an ungenial medium. The soil is either too wet or deficient in the essentials for healthy growth. The affected parts should be cut out now, and just before the leaves fall much of the old soil should be cleared from the roots, those which strike down into the subsoil cut off, and fresh loam, containing calcareous matter and wood ashes, placed round the others, made firm, and mulched, then healthier growth may be expected. The Apple is the Early Julyan, a useful summer cooking variety.

Eucharis as a Fine-foliage Plant (*A. Waters*).—For purposes of exhibition the term "ornamental foliage plant" has reference to plants that are cultivated for the beauty of their leaves, and not of the flowers. Eucharises are grown for the beauty of their flowers, and not of their leaves, and we should not consider a non-flowering plant of *Eucharis amazonica* admissible in a class for "ornamental foliage plants." Its leaves when large, healthy, and glossy are ornamental no doubt, and so are the leaves of all plants when in perfect condition, whether they are large or small. We think the objection in question was well founded.

Pyrus floribunda (*C. W.*).—This is one of the most ornamental of hardy shrubs, inasmuch as the flowers are of a beautiful rich rosy red, and very freely produced in April or May, being followed by very small, long-stalked, nearly spherical fruit of a deep red colour on the sun side. We have no experience of the edibility or otherwise of the fruit, but we think there would be too much core, too many seeds, and too little flesh for it to be of any particular value for preserving similar to the Siberian Crab. *P. floribunda* is a native of Japan, and was introduced only a few years prior to 1881, when it was exhibited at the R.H.S. under the name of *Malus microcarpa floribunda*. There is a *Pyrus floribunda*, *Lindley*, which is a synonym of *P. arbutifolia*, the Chokeberry of North America.

Peach Trees Unsatisfactory (*J. H.*).—The trees may drop their fruit prematurely through imperfect stoning. This may be due to defective fertilisation, but the hole in the stem, or rather a hole in the base of the fruit next the stem, is mostly an indication of gum disease, which proceeds direct from the ovary and base of the kernel, the stoning being defective. Many fruits then fall instead of swelling just before stoning commences, and some after stoning in the early stages of the second swelling. The trees would be better lifted and replanted in fresh loam, but they are rather old to lift entirely; therefore, the soil may be removed down to the roots, be picked from amongst them carefully and fresh supplied, raising any deep roots and laying them in the new soil, taking particular care of the fibres, especially those near the stem. Good strong turfy loam of a calcareous nature is the best, taking it off an old pasture about 3 inches thick, adding to it about one-sixth of old mortar rubbish, freed of laths and other pieces of wood, if the soil is not naturally calcareous. It is better to employ manure as top-dressing than to mix any with the soil. The borders should be thus renovated before the leaves fall from the trees, but not until the wood is mature and the foliage commences to ripen.

Blight in Onions (*F. L.*).—The Onion tops or leaves are infested by the Onion mildew (*Peronospora Schleideniana*), which causes a whitish-grey bloom on all the young leaves, and fills all parts with its mycelium, causing them to become brown and black. There are also myriads of spores (both uredo and teleuto) of another fungus on some parts of the leaves, and this parasite (*Puccinia mixta*) has been observed as hurtful to Onion crops at Shrewsbury and other places in England, also near Aberdeen and other districts in Scotland. The chief mischief in your case is caused by the mildew first named, and, owing to the fact that the fungi live inside the affected parts, and only produce their reproductive parts (spores) on the outside, they are difficult to deal with. The mycelial threads are also found on the outside in some cases (yours is one), and then the parasite is easier assailed. As the disease has not spread to the bulbs we advise dusting the Onions thoroughly with fresh burned lime, slacked, and applied as soon as sufficiently cool on a calm day, preferably the early part, coating the plants well in every part. This we have found very effectual in arresting the spread of the disease caused by *Peronosporas*, including its closely allied species *Phytophthora infestans* or the Potato disease. When the crop is mature it would be advisable to burn the tops of the Onions, and have the ground deeply ploughed or dug, so as to put the germs of the fungi out of power for mischief, or at least a majority of them, for a considerable time. They live or retain their germinative power for several years, certainly not less than four. See Names of Plants.

Names of Fruits.—*Notice.*—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (*J. D., Wales*).—We have many times stated, and twice within the last month, that Peaches cannot be named without summer shoots, as the glands on the leaves have to be examined, information about the flowers, whether they are large or small, is also necessary. You have entirely overlooked these essentials. (*McK. B.*).—The red

Apple is Mr. Gladstone. We have taken some pains to determine the names of the others by comparison, and have arrived at the conclusion that they are local varieties without any generally recognised names. The numbers slipped off the stalks, and we can only say the smaller Apple was fairly good, the other worthless. (*D. E.*).—1, Citron des Carmes; 2, Williams' Bon Chrétien; 3, Jargonelle. (*Lex*).—1, Duchess of Oldenburg; 2, Red Astrachan; 3, Manks Codlin.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*J. R.*).—The light Carnation is a very good one, and worth keeping. Is it not paler than Mrs. Cannell? It resembles the light form of Mary Morris, but we do not undertake to name varieties of these and other florists' flowers. Thanks for the cuttings. (*F. L.*).—They are *Potentillas*, probably unnamed seedlings. (*T. S.*).—Specimen insufficient (no leaves), but possibly *Gypsophila paniculata*.

HOME FARM

A BUTTER FACTORY.

IN these articles we have often placed much stress upon the importance of close attention to the details of cow management,

as well as of milk manipulation in the dairy, but we must admit that the final result, the crown and finish of the work, rests entirely with the dairy manager. That is the reason why factory butter is so superior to the ordinary samples from farmhouse dairies. The art of churning consists in the thorough separation of the butter grains from the butter milk. At the factory this is done to perfection; at the farmhouse it is a very doubtful matter indeed. Careless, hasty churning breaks up the butter globules, mixes the casein with them, colour and flavour are then both spoiled, and the butter soon becomes rancid from the decomposition of the casein. Evidence of this careless practice is afforded by the white streaks so frequently present in butter, which when quite fresh is fairly palatable, but never has the delicate nutty flavour of really pure butter, and is soon unfit for use.

There can be no doubt that dairy schools and dairy lectures do much good, both by showing how good butter is made, and in explaining why failures occur. Worthy farmers' wives, ignorant as most of them are of the science of butter-making, must often wonder why the butter is streaky again. Have they not taken care to stir the cream, to scald the churn, and to place the cream in it with their own hands? Yes, but then came the hasty summons of the odd man or lad to the churning, at which he is thoughtlessly urged to "make haste." He does so, dashing the cream about rather than steadily agitating it, and there is more streaky butter, with the resultant vexation and certain loss if the butter is not used at once. Lecturers explain clearly how this occurs, and how it may be avoided; they also show the importance of temperature, of uniform condition of the cream, of thorough washing and working of the butter, and how long really pure butter is free from rancidity.

It is just because every detail has attention that factory butter is so superior and is so much in demand that there is never enough of it. Let us see once more what are the other special advantages of a factory. The building consists of three divisions, connected, yet shut off from each other—the engine room, the dairy with an upper storey, the weighing and milk delivery department, out of which doors open into the storeroom and dairy. The new milk is received and the separated milk despatched without the persons engaged in that work having to enter the dairy at all. Each churn of milk as it is brought is placed upon the machine, which weighs it and prints the weight upon a slip of paper. It then elevates the vessel and empties it into a cistern in the upper floor, whence the milk passes through a pipe to the dairy into a separator driven by steam. The cream runs into receivers, the separated milk being driven upwards to a refrigerator, flowing thence, cooled, into another cistern, whence it is drawn into the weighing room and taken away. The churn, usually a large barrel one, and butter worker, are also driven by the engine. As the butter is made up into pounds, it is placed upon small slates, each holding 15 lbs., and taken to the storeroom, where iron racks are fixed around the sides to receive the slates. Access to the engine room may be had by a covered way, but it should always be by an outer door, to avoid all risk of dust or steam in the dairy. The cleansing of the dairy utensils is done over a steam pipe, so that the scalding is perfect. All drains are upon the surface, with clear and wide outlets taken right away from the building so as to render any accumulation of sewage impossible.

In the new co-operative factories in the South of Ireland the test for quality is applied by periodical churnings of whole milk from the cows or each member. Here we have the creamometer testing quality by degrees, and the Victoria tester, which, by an arrangement of multiplying wheels, causes a holder containing small bottles of milk laid horizontally like the spokes of a wheel on its side, with corks inwards, to revolve with such rapidity—centrifugal force again—that the cream flows to the inner end or tops of the bottles "while you wait," and the quality of the milk is visible at a glance. This requires only two or three

minutes, and is the most satisfactory and interesting test we have tried.

The entire building externally and internally should exemplify economy of materials, space, and cleanliness with efficiency. We commend it to the attention of technical education committees, for we should much like each county to possess a model dairy factory, either for butter or for both cheese and butter, as well as a model dairy farm, fruit farm, and allotment. Why not? County councils have ample means at their disposal. If they hope to impart exact knowledge, to lead the people on to better things, they must show the way by the actual example of something more tangible than a lecture affords.

WORK ON THE HOME FARM.

In addition to the sowing of *Trifolium incarnatum*, advised last week, Italian Rye Grass may also be sown on a clean stubble, nothing more being required than a turn or two of harrows and light rollers. Do not forget, however, that this Grass is a particularly gross feeder, which, if sown in poor or exhausted land, will give a full plant, but it will be stunted and yellow. The fact of sowing upon a stubble should tell one that the crop just cleared has taken much plant food out of the soil, and if we would have early strong growth in spring 2 or 3 cwt. of basic slag or mineral superphosphate per acre should be harrowed-in with the seed; then, with some nitrogenous manure applied in February, a really useful supply of rich fodder can be had. Like Oats, Italian Rye Grass quickly shows one the condition of the soil. We have had self-sown seed of it come up so thickly with corn that the stubble had the appearance of a meadow, but the grass plant had a very yellow poverty stricken appearance till a top-dressing of manure was washed down to the roots. No crop answers better to the touch of manure nor so bountifully repays one for liberal treatment.

Fine harvest weather, much as we value it, proves trying for pasture. Keep is already becoming scarce, and a prolonged drought will make bare pasture this autumn. The crop of Green Maize sown early in June will now soon be in use. We find it so great a boon that we wonder it is not more generally grown. A field of it is still a rare sight, so little are farmers given to change, and so slow are they to take up a new thing. Yet here we have a crop of most easy culture, yielding from 20 to 30 tons of wholesome green succulent food per acre, which is so palatable that cattle fight in their eagerness for it. All that it requires is a rich soil, watchfulness against rooks till the plant is visible, and using before there is much risk of harm from frost. It is positively refreshing to watch cattle crunching the large succulent stems of it out on a parched pasture. It answers perfectly well in ordinary soil rich in fertility, but on a sewage farm it grows from 8 to 10 feet in height. The point of most importance is its suitability for all farms free from frost for about four months as a minimum. We call attention to it particularly now in order that those home farmers who may feel the pinch of drought may be induced to sow some Maize another season.

REMARKS.

- 14th.—Sunny and warm day, cloudy evening, gale at night.
 15th.—Bright breezy day, slight showers between 5.30 and 6 P.M.
 16th.—Bright early, haze, or almost slight fog, between 8 and 10 A.M., then drizzly till 1 P.M., and bright sun again after 3 P.M.
 17th.—Almost cloudless morning, and sunny and warm throughout.
 18th.—Overcast and very damp, foggy at times, and frequent slight showers; thunder-storm with vivid but rather distant lightning in evening.
 19th.—Overcast and extremely humid, with occasional spots of rain, and a very heavy shower between noon and 1 P.M.
 20th.—Bright and sunny.

A warm, but on the whole unpleasant week, the 16th, 18th, and 19th being three of the most objectionable days remembered in August.—G. J. SYMONS.

AS briefly announced in our last issue, a Conference on Apricots and Plums was held on Wednesday, August 24th, in the gardens of the Royal Horticultural Society at Chiswick, in connection with the Exhibition reported in the same number. There was a fair attendance. In the absence of Mr. R. D. Blackmore, who was to have opened the proceedings, Dr. Hogg presided, and introduced the readers of the papers.

Mons. F. Jamin's paper on Apricots was first given. The essay, written in French, and translated by the Rev. W. Wilks, was of an extremely interesting character. The essayist dealt with the subject in a masterly manner, and detailed the method of Apricot culture adopted in France. In that country, he said, Apricots ripen more or less irregularly, but when well grown few open air products are more choice. The trees do best on a warm calcareous soil, and when sheltered from the north-east winds. If only sheltered by other fruit trees the Apricots derive considerable benefit. They succeed in and around towns, but according to his experience shelter is indispensable. Apricots, he said, are cultivated extensively in many parts of France. The market growers, in many instances, gather the fruit before it is ripe, and notwithstanding want of quality, it finds ready purchasers, and fair prices are realised. Considerable quantities of Apricots, said Mons. Jamin, are converted into jam, in the manufacture of which, however, Pumpkin flesh largely enters. Regarding the best localities for Apricot culture in France, it was stated that in the valley of the Rhone they did remarkably well. For twenty miles or so west of Paris, on the banks of the Seine, there is a remarkable tract of land devoted principally to the culture of this fruit.

The soil is light and calcareous, admirably adapted for the purpose. Everyone there grows Apricots. The trees, as a rule, are planted from 12 to 15 feet apart, and are globular or vase-like in shape. The growers attach the greatest importance to their system of pruning, usually cutting the shoots back to three or four eyes. Generally the trees commence bearing three years after planting, but are most prolific when from ten to fifteen years old. Many of the trees in that neighbourhood, however, are very old but still continue to bear large crops annually. The average yield per tree each year is calculated at about 60 lbs. when in full bearing, and it is estimated that the annual sale of Apricots from those districts realised a sum of no less than £2000 sterling. The growers who sorted and packed their fruit carefully, of course, secured the best prices, a remark, by the way, that fruit cultivators generally might take to heart. All the Apricot trees in the districts mentioned are grafted on the St. Julien Plum stock. Mons. Jamin's paper also included some remarks regarding the classification of Apricots, observing that many varieties could be distinguished by their leaves and stones, some of the latter being perforated.

A brief but instructive discussion regarding Apricots followed the reading of the paper. A gentleman present asked why the branches of Apricot trees died without any apparent cause. Replying, Dr. Hogg observed that the gaps alluded to are mainly caused by frost, generally the previous winter. The sap vessels are destroyed or lacerated, and in the spring these vessels fail to supply the necessary nutriment, hence the withering of the branches when the sun gains power. Something might be due also to soil, such as deficiency of lime, which always results in a failure with stone

fruit. Mr. W. Paul concurred, and reminded those present that Apricot trees are much more tender than is generally supposed. The branches of some varieties, too, he said, are more liable to die suddenly than others. He had had experience of this. Some years ago he had a number of Moorpark Apricots growing on a wall, and some of the branches died in the manner described. The trees were moved, the soil carefully renovated, and other varieties, including Blenheim, planted with them. Still, the branches of Moorpark continued to die off, but Blenheim never lost a shoot, and this variety is now and has always been in a healthy condition. He therefore suggested the culture of this variety, inasmuch as it is not subject to the disadvantage complained of. Mr. Paul also sensibly observed that everything which tends to keep the trees in good health should be done, never allowing insects, not even an aphid, to gain a footing. Judicious pruning and watering were important factors, too, that the cultivator should not overlook.

The Rev. W. Wilks asked why Apricots are so difficult to grow under glass. For some years, he said, he had tried to grow them thus, but had failed. The trees were healthy, made plenty of growth and foliage, and flowered freely, had plenty of air, but yet failed to fruit. Out of seven fine trees in pots he had but one fruit this year. Had the stigma of the blooms anything to do with it? He observed that the stigma of Apricot blooms turned round instead of pointing outwards as in the Peach and Nectarine, and were thus protected from the bees.

Mr. Bunyard thought the failure to grow Apricots on walls satisfactorily in this country was owing to the borders in many cases being too closely cropped with vegetables. In October heavy rains generally set in, and these have a tendency to start the Apricot roots that are growing in the rich soil provided for the vegetables, into life, when they required rest. If the borders could be covered with shutters after that time he thought Apricots would be grown much better. The situation, he said, cannot be too hot or too dry for Apricots. As to the branches dying, an old cultivator he knew used to cut away the black diseased wood and paint the wounds with knotting with great success. With regard to the Rev. W. Wilks' question Mr. Bunyard detailed the method of treating Apricots under glass in a private garden of his acquaintance. The trees there, he observed, are kept dry all through the winter, and after starting into growth, deluged with water once a fortnight until the fruit is gathered. The reason why many fail to grow Apricots under glass is owing to there not being sufficient nutriment in the soil in the pots to support the quantity of growth generally made. He should recommend planting the trees out under glass in preference to growing them in pots. The Shipley and other old-fashioned sorts, in his opinion, are much hardier than the choicer kinds and best for general cultivation.

Dr. Hogg at this point explained that the perforated stone, mentioned by Mons. Jamin in his remarks on classification, and by which some varieties could be identified, meant that the channel which is usually present in Apricot stones was covered instead of being open. Mr. W. Roupell then detailed his experience as regards Apricot culture, advocating firm soil for the trees, and Mr. T. Francis Rivers advised keeping trees under glass dry in winter. Surface dressings also do good, he remarked, and plenty of ventilation is most essential. The stoning period is a critical time, and if the house is shut up closely at that period the fruit is liable to drop.

Mr. Rivers next read a paper on "Dessert Plums." He opened his subject by remarking that dessert Plums were likely to become an article of great value in the Colonies and other foreign countries, where the drying of fruit was adopted. As regards varieties, he said none can challenge the Green Gage, of which there are many varieties. Among others, the Early Transparent, called the Early Apricot in the "Fruit Manual," is a useful variety, whilst the same can be said of Late Transparent, a variety that will be largely

grown in the future. Although the Gages are at the head of the list, Mr. Rivers said there are other good dessert varieties, and mentioned Kirke's and Jeffersons as being excellent September Plums. Coe's Golden Drop he also referred to as being a first-rate October Plum, and among recently introduced varieties The Czar and Grand Duke are very fine, the last-named being especially good under glass. Referring to this portion of the subject Mr. Rivers said that no fruit is more easily grown in pots under glass, all that was necessary being judicious treatment and abundance of air. Some interesting remarks as to the classification were then given, but Mr. Rivers did not think it necessary to go into cultural details.

Mr. Bunyard, in the brief discussion which followed, said he should not advise anyone to unduly reduce the number of varieties of fruit without carefully considering the matter, inasmuch as some kinds in certain positions and seasons were much less prolific than others. Apart from Green Gages, he thought Kirke's one of the most delicious Plums that could be grown on a wall. A gentleman mentioned that Belgian Purple was an excellent dessert Plum, and worthy of extensive culture.

Mr. J. Smith's paper on "Cooking and Market Plums" followed, and was read by Mr. A. Dean. To succeed in growing Plums for market, the essayist said, only the best early and late varieties should be cultivated, and these must be properly packed. The Plums must be of superior quality and uniform in size to realise remunerative prices. In this country there is, he observed, the best market in the world for fruit, and in due course, no doubt, the railway companies will adopt cheaper rates to facilitate the fruit-growing movement. One important factor in growing Plums for market is the selection of the site. The situation should be open, and the soil of a stiff loamy character or even clayey if fertile. On grass land standards with 6-foot stems are best, and these should be planted 20 feet apart. Damsons are the most profitable crops on grass. In planting the soil can hardly be made too firm, neglect of this being a frequent cause of failure. When the soil is firm and rich the growth also will be firm, short-jointed, and well ripened. Victoria is a good market variety and an excellent cropper; but Early Prolific, said Mr. Smith, is one of the heaviest and best Plums to grow. These two varieties should be always grown. The Czar, Pond's Seedling, Diamond, and Sultan were also excellent kinds for the purpose named. Where deficient naturally, lime might with advantage be applied to the soil, and yearly dressings of manure should be given. The trees must never be allowed to become a thicket, but all small useless branches cut out. When grown on cultivated land Gooseberries and Currants could be planted between the Plum trees, and so help to swell the returns.

As to gathering and packing the fruit Mr. Smith advised growers to place the first-rate samples by themselves, and those of second-rate quality similarly. The results then are, as a rule, much more satisfactory to both vendor and purchaser. Prices, he said, varied considerably. For seventeen years he had grown Plums for market, and had disposed of as many as sixty tons in one season. In some years he had only obtained 1s. 3d. per bushel for Plums of first-rate quality, whereas in other seasons the same kind of fruit realised 18s. per bushel, and even as much as 25s. in the autumn.

Mr. Bunyard cautioned growers against planting Early Orleans, inasmuch as many trees of that variety were killed in Kent last winter by frost. Belle de Septembre, he said, was not to be depended upon as a regular cropper, but Belgian Purple and Bleeker's Scarlet were always good. Half-standards are better than standards in his opinion, they being less liable to be damaged by the wind.

A gentleman detailed his experience of Plum culture for market in Cambridgeshire, remarking that Rivers' Early, The Czar, and Victoria are the best varieties that could be grown for the purpose in that district.

A vote of thanks to the Chairman and lecturers brought the proceedings to a close.

FUNCTIONS OF VINE LEAVES.

MR. W. IGGULDEN has brought to the notice of readers of the *Journal* a subject of vast importance and equal interest, which should be the means of eliciting much useful information if others will join in the discussion in the admirable spirit in which it has been started. I have long been in the habit of considering your correspondent's articles thoroughly as a whole before giving a decided opinion on any particular portion of them. Having applied this method in the present instance, I have come to the conclusion that the ideas he advances concerning the functions of Vine leaves and the management of Vine shoots are not so much opposed to those which generally prevail as might at first be supposed, nevertheless there is ample opportunity to lay bare the weak points of his contentions by recording facts which point to opposite conclusions.

The theory advanced by Mr. Iggulden, "that the bunches after being developed by the aid of stored up sap and moisture ascending from the roots are largely, if not solely, sustained subsequently by the crude sap ascending from the roots, and not by that elaborated by the leaves," is not only entirely at variance with the teachings of plant physiologists, but is also opposed to many well-known facts connected with Vine culture. How is it that Grapes cannot be perfectly coloured if the leaves on the laterals carrying the bunch—especially those at the extremity—are not in a healthy state? Take a shoot, for instance, on which the leaves behind the bunch are badly infested with red spider, while those near the base are quite fresh and healthy; if the bunch is principally sustained by the crude sap ascending from the roots the colouring process should not be materially affected provided the principal portion of the leaves on the Vine are healthy, yet, as far as my experience goes, the opposite is the case.

This view is also strongly supported by numerous experiments carried on with Vine shoots, which can be easily tested by anyone. Let the experimenter select a healthy Vine shoot carrying a good bunch, with two or three primary leaves beyond. If the bark of this shoot is ringed between the bunch and the first leaf beyond, as soon as the bark is formed the berries will continue to swell without any apparent check, but the colouring process will be only imperfectly performed. Although I agree with Mr. Iggulden that good bunches and fine berries may be produced by stopping at the joint from which the bud springs, yet if no lateral is afterwards taken from that joint there is not the slightest chance of colouring the bunch properly, although there may be abundance of healthy foliage on other parts of the Vine. This, I think, clearly shows what plant physiologists have long maintained—namely, that it is principally by the aid of elaborated sap produced by healthy Vine leaves, and supplied to the bunches in its downward course, that the chemical process by which Grapes are brought to perfect maturity takes place.

Taking all these facts into consideration, the practice of invariably stopping Vine shoots at the second joint beyond the bunch, and afterwards keeping all sub-laterals pinched back closely, is, I think, not the best course to pursue. That a vast quantity of good Grapes are annually produced by working on these lines I do not dispute, for it is a striking fact that some men in any walk of life accomplish much by energy and industry, even when working on a system which is not a good one. Does it seem feasible that a creeper of such a rambling nature as the Vine should bear such close cropping year after year with impunity? Go where I will I am continually meeting with instances in which old Vines have been rejuvenated by laying in young rods or by allowing plenty of lateral growth, and I also frequently see others which should be in their prime far from satisfactory through close stopping and overcropping. Even with the same weight of crop I would guarantee to greatly improve such Vines solely by encouraging plenty of lateral growth, for Vines will carry and finish perfectly a much heavier crop than many people suppose. I am perfectly convinced that those who crop lightly and stop closely are compelled to resort to the former practice because they continue the latter one.

I well remember paying a visit to the vineries of an eminent Grape grower, with whose writings the numerous readers of the *Journal* were a few years ago well acquainted, and whose grand examples of Grapes have, during recent years, been staged at many great shows, where they thoroughly merited the awards received, and have won universal admiration among high-class fruit growers. When paying the visit in question I especially noticed the large amount of lateral growth going on while the Grapes were colouring. The main laterals were trained thinly, and beyond each large bunch the sub-lateral was allowed to develop continuously. These were in some cases hanging down for a foot or two below the trellis, yet there was not the slightest overcrowding. No one seeing the Grapes could have any doubt about the treatment being correct; such an

uniform number of immense shapely bunches I have never seen before nor since, and the weight of fruit per square foot of glass roof is not often seen on Vines of the same age combined with good colour.

It must be admitted that a crop consisting solely of large bunches, although demonstrating the height of cultural ability, is not so useful for providing a continuous supply as a large number of smaller bunches, but a few large bunches are always prized by all classes of cultivators. The distance at which Vine rods should be trained apart ought, therefore, in my opinion, to be determined by the purpose for which the Grapes are required, and for general purposes 4 feet apart, as Mr. Iggulden advises, is doubtless about the right distance for many varieties. Give Muscat, Gros Guillaume, and Trebbiano in all cases another foot of space.

In dealing more particularly with sub-laterals, I cannot altogether agree with Mr. Iggulden that they should be chiefly valued as affording a safe outlet for superfluous energy, for I maintain that to keep Vines healthy and vigorous year after year the roots must be kept in an active state, and I opine that the best way to do that is to have a little growth continually going on till the Grapes are ripe, rather than by persistently pinching it back after the primary leaves are formed. I have always adopted the practice of allowing a continual extension of Vine shoots carrying exceptionally large bunches, and am confident that such a practice does much towards helping them to finish the berries properly. This, I contend, is caused by the vigorous circulation and elaboration of sap thus kept up on those portions of the Vine where the greatest strain is felt. I maintain, therefore, that the best course to pursue is to stop back closely all sub-laterals on shoots not carrying a bunch, and to allow the strongest sub-lateral beyond every large bunch to grow unchecked for a time, merely taking out the point when it shows signs of becoming very strong. There ought to be no difficulty in disposing these growths between other leaves and shoots without producing overcrowding.

This is a far different matter from allowing growths to develop on the back wall of a vinery, where but little light and scarcely any sun reach them. They are, moreover, wrongly placed, as it is on the extremity of shoots carrying bunches that extra growth is so beneficial.—H. DUNKIN.

SWEET PEAS.

I HAVE read with much interest the notes on the culture of these most charming annuals appearing in your last issue, and hope to follow in the coming season some of the good advice therein given with advantage, though I cannot but think that the quantity of soot recommended is somewhat excessive and enough to smother the plants.

As I have made these attractive flowers a special study for the last two years, I can most strongly recommend to all growers of them the use, for their support, of the light and comparatively inexpensive wire hurdles, 6 feet long and 5 feet high, supplied to me by Messrs. Hawkins & Co. of Birmingham, who, at my suggestion added legs to each end to drive into the ground and keep them in an upright position, which had previously to be effected by lashing a stout bamboo cane to each end of the hurdle. These supports do not seem to be known to your correspondent, as he still seems to use the clumsy and untidy Pea sticks to support them.

I quite agree with Mr. Brotherston as to the great beauty of Mrs. Eckford and Her Majesty, both sent out for the first time this year, but am not inclined to give so high a position as he does to Countess of Radnor, as though undoubtedly a delicately pretty and uncommon shade of colour, it is unfortunately of a weak and delicate habit of growth, and but seldom makes a perfect or fully developed flower, the back petals usually lying down on the front ones instead of standing upright as they should do, which gives the flowers a withered and unsightly appearance from the first. It is also an extremely shy seeder, hardly any of the seed it does give filling thoroughly as other sorts do, and being consequently of most uncertain germination. In Dorothy Tennant, a very beautiful variety, sent out, I think, for the first time this year, a most admirable substitute for the last named variety might, I think, be found; it has, moreover, two entirely distinct and different shades of colour, one on opening, changing to the other and deeper shade after being open for a day or two.

Another very fine Pea is H. M. Stanley, which is, I believe, to be sent out next spring or this autumn for the first time. This is, in my opinion, by far the finest dark variety that has yet been seen, and has been at once noticed and remarked as such by all friends who have seen it in my garden during the summer. This fine variety should, I think, quite throw into the shade such older and once highly esteemed sorts as Boreatton, Monarch, and others.

Another most beautiful Pea sent me this year by Mr. Eckford is named Gaiety, and is white, clearly streaked with rose colour. I saw an almost, if not exactly, similar flower at the Drill Hall meeting of the Royal Horticultural Society, on August 9th, in a group sent in from the gardens of the Society at Chiswick, having been sent there for trial and comparison with others, and bearing the name of The Queen. It was sent by Messrs. Barr.

A careful examination of this large group of blooms quite convinced me that there are far too many varieties bearing separate names, which only leads to confusion, as many of them are so slightly different from others as only to be distinguishable by the most practised eye. Another fine and most distinct variety, though by no means new, and not mentioned by Mr. Brotherston, is Orange Prince, also raised by Mr. Eckford, which I think should be in every choice collection.—W. E. GUMBLETON, *Belgrove, Queenstown, Ireland.*

THE RESTING OF PLANTS.

THIS is a very important point in the study of gardening. It too often occurs that when plants—especially bulbous kinds—have finished flowering they are removed into out of way places until sought for again. I am alluding now to Amaryllis, Begonias, Gloxinias, and such like plants. It is certain that during the time of flowering there must have been a great strain upon them, so it becomes clear that to be successful year after year with the same bulbs we must pay great attention to their requirements immediately after flowering, so as to encourage them to store up sufficient strength previous to going to rest that they may, when started again in the spring, give full satisfaction. A careful study is requisite in bringing about a gradual state of rest, to which most plants are subjected by withholding water at the proper season.

The mention of Amaryllises, as requiring especial care as to watering after flowering, should not be passed without comment. We all are aware of the wonderful progress that has been made in the development of this gorgeous family of plants of late years, and their growing popularity. This makes us anxious to know something more of their requirements. The plants have their season of growth after the flowers fade. The rapid production of leaf and flower from the bulbs seems to exhaust them so much that they shrink considerably by the end of March or beginning of April, and in consequence a season of growth should be encouraged from them until about the end of August, when the bulbs will be found to have plumped again. During that period the process of development is very rapid, and any check to the growth would not be easily recovered from.

In September we gradually withhold water. In October, November, and December the plants are kept without any. In January the bulbs are plunged in gentle bottom heat, but we give no water for at least three weeks, provided the soil is moderately moist at the time of potting. I have found that an excessive atmospheric moisture in the house will engender decay of the bulb above ground, and the same process goes on at the base of the bulbs if too much water is applied to the soil.

To bring about a gradual rest in plants it becomes necessary to lower the temperature they have been growing in at the time the water is being withheld from them, but sometimes we are not fully aware as to how far we may go in the matter of low temperature until we have lost some of our plants by being kept too cold whilst at rest. Take for instance Orchids, the East Indian section. To bring these to a state of rest we endeavour to maintain for them a temperature of 60° by night and 65° by day generally, from November till about the middle of February, a little air being given on every fine day to dry the atmosphere. The cultivator must study and apply the needful rest to others of this class, lowering the temperature in proportion as the case may be, considering the climate and conditions under which these are found growing, always being careful in applying water to the plants in the lower temperatures.

I believe there are more Orchids lost by overwatering than from any other cause; although not showing it at the time, it will surely tell upon them afterwards. In their own native habitats we are told they receive a great deal of rain during the growing season, but we must not forget how very different are our houses to their home. With us they are closely confined, and evaporation does not take place to such an extent as where they are growing in nature on rocks and trees, in positions where the wind quickly dries up the superabundant moisture. Thus we must study the importance of rest to this and other classes of plants, and imitate as near as we can the natural rest to which they are subjected.

In the case of greenhouse plants I think the resting period may

or does extend from November to February, during which time we should maintain the temperature as near as we can from 45° to 50°, with as little fluctuation as possible. No doubt gardeners have noticed how Azaleas are excited into growth in the winter months, and in many cases the buds are so weakened that they go blind. I believe this is caused by keeping the plants in a too high temperature, probably by excessive fire heat. This has such a tendency to dry the plants that frequent watering is necessary, causing the growth to start, much to the annoyance of the cultivator. The same thing occurs with Camellias and many other plants. It thus becomes very necessary to watch closely the variation of temperature outdoors in connection with resting plants, as at times it may be 50°, or even higher, and we must then guard against any excessive amount of moisture about our plants. High night temperatures should, as far as possible, be avoided.

It should be remembered that in whatever position a plant is placed it should stand perfectly level, and on some material where the water may drain away freely. If the plant is not level the danger is that the soil on one side of the pot is dry and the other side wet, which is the worst possible condition for a plant to be in.

The action of rain water, whether artificially or naturally applied, has been proved to be by far the most beneficial to plants, as by its aid the solubility of food becomes more rapid. Guard against the application of cold or hard water to the roots of plants, and especially in the winter months, when there has been a heavy fall of snow, hail, or cold rains. The water in the tanks then becomes very much too cold. This may not be noticed in the ordinary course of things, and the plants are sure to suffer a check at the roots that, in the case of Camellias, for instance, would be quite sufficient to cause bud-dropping. I am always very careful that the water in our tanks is a few degrees warmer than the house in which the plants are growing. This is very important in successful plant culture. We are apt to say sometimes on beholding a sickly plant—one mildewed or with rust on the foliage—that it must have been subjected to a draught or current of cold air, whereas the probable cause was the use of cold water, which paralysed the roots. Proof of this may easily be seen by giving one or two applications of cold water to winter Cucumbers or Kidney Beans when setting their pods.

The syringe is useful when rightly used. It is not uncommon to find a plant full of roots lacking the necessary amount of water needful for its support, as by the appearance of the surface of the soil it may seem to have even more than is required. The cultivator must not err on this point, and hence the syringe, good old friend as it is, must not be trusted too far. One other important thing occurs to me. Water tanks should be occasionally cleaned out, as there is often a great accumulation of soot and dirt in them, which is syringed upon the plants and disfigures them, as will hard water or water charged with lime.

Another important fact should be borne in mind, and especially should young gardeners note this, as sometimes they may be called upon to undertake the management of perhaps a large garden; I mean the adequate provision of a supply of soft water. In our own neighbourhood we have not much to fear as to a water famine, but in some districts it becomes a consideration of the highest importance. No one knows the difficulties experienced through a scarcity of water in a garden but those who have to endure it, nor the anxiety of gardeners when they see their crops dwindling away. An excess of rain cannot be prevented, but a water famine, in most cases, if not in all, may be averted by a well devised system of storage when the rain is in excess of immediate requirements. In conclusion, I would say to all young men, Learn to observe, take notice of all your plants from day to day, keep in mind the treatment you have subjected them to, notice the slightest change in their appearance, and discover the cause of it. You will then have made a start in the right direction, for depend upon it the man who errs and finds out the true cause of his failure has learned something; but, on the other hand, he who ascribes his failures to the wrong cause has not. Observe the appearance of plants in perfect health and endeavour to keep them so. It is better to learn by close observation than to follow instructions laid down by those of us who are working perhaps under very different circumstances, as you can then work in accordance with your own surroundings.—B. CROMWELL.—(Read at the Liverpool Horticultural Association.)

HARDY FLOWER NOTES.

WE are having a late season, and, although we have had better weather for the last few days, storms of wind and rain have sadly marred the beauty of the flowers. Some of the late opening flowers seem as if they had lingered too long before appearing

upon the scene, and everything betokens a short period of beauty. The Tiger Lilies have only opened their flowers within the last day or two, Hyacinthus (Galtonia) candicans still dallies, and refuses to open its chastely beautiful bells, and other late bloomers open but slowly. The Composites are, however, in force.

Looking at the Sunflowers with their golden blooms, one is at a loss to decide whether they lighten the dull days or, by the contrast of their brilliancy, make the rain and the gloom more perceptible to our eyes. Some of them seem hardly at home in our northern latitude, and look as if they longed for sunnier realms, where the luminary whose name they have appropriated shines for a longer time and with brighter radiance. The day of the annual Sunflowers seems to have departed, for a time at least, and, admirer of perennial flowers as I am, I cannot but miss these great, golden heads on gigantic stems which decorated so many gardens. They were overdone, no doubt, but in some positions they were unequalled, and among the numerous perennial species, their allies, and their varieties we have none to compare in massive grandeur with the annual varieties. Yet there are some fine plants among the perennials, plants which hardly merit the contemptuous way in which the late Robert Browning spoke when he said:—

"I know a mount, the gracious sun perceives

* * * *

And underneath the mount, a flower I know,
He cannot have perceived, that changes ever
At his approach, and, in the lost endeavour
To live his life, has parted, one by one,
With all a flower's true graces, for the grace
Of being but a foolish mimic sun,
With ray-like florets round a disc-like face."

And this flower, he says, "men call the Sunflower sportively." We are not, however, content with the "ray-like florets round a disc-like face," but have sought to discover or to raise double forms, and the search has not been in vain. *Helianthus multiflorus* plenus has been succeeded by the fine *Soleil d'Or* with its quilled florets, a decided acquisition in the garden, and apparently quite hardy in this locality. Beautiful also is the newer *Bouquet d'Or*, which, however, seems to be of a more delicate nature, as it did not survive last winter in my neighbourhood. This is unfortunate, as its fine colour and form make it very acceptable. Then, although not coming within the category of double flowers, we have the fine *Helianthus giganteus*, a name which I feel justified in taking exception to as impressing us with an idea of ungainliness and want of grace, whereas there is nothing of the kind in this graceful flower with long wand-like stems and somewhat small flowers. Would that we could give it a sheltered spot where it might display its graceful habit unfettered by stake and tie. It is only thus that some of these fine flowers can have justice done to their beauties. But, alas! such wind-swept gardens as mine necessitate that tall flowers should be condemned to a confinement and bondage unnatural and undesirable.

If these golden flowers are thus adorners of the garden, there are others beautiful alike in the garden and as cut flowers. Among the latter white flowers are always welcome, and specially useful from the quantity of bloom, from the neatness of the flowers, and from their easy growth are some of the *Achilleas*. Perhaps one of the best of these is the well-known *A. Ptarmica* fl. pl., the double-flowered Sneezewort, which is said to be known in Gloucestershire and other parts as "Seven-years' Love," and to be carried by bridesmaids under this name. The march of improvement or the desire for novelty has, however, introduced to our notice a rival flower known under the name of *A. grandiflora* The Pearl, an appropriate enough name, justified by the character of the flower. The flowers are larger than those of *A. Ptarmica* fl. pl., looser and lighter in the formation of the flower, and have a pleasing colour, differing considerably from that of the older plant. This shade, if the term is permissible, is well described by the name The Pearl, as the flowers are of a pretty pearly tint. Growing in the garden the difference of the flowers is not so noticeable, but when cut and placed together it is readily seen. I saw the two shown in competing stands at a flower show lately. The stands were side by side, and the most careless observer could hardly fail to observe that The Pearl was an improvement upon *A. Ptarmica*.

The value of these *Achilleas* for cutting leads me to refer again to the *Eryngiums* or Sea Hollies as being very useful for cutting to dry for winter decoration, a use which many people do not seem to be aware of. They should be cut before their best bloom is over, and hung heads downward in a dry warm place until they are thoroughly dry. I made a remark some time ago on the confusion in the nomenclature of these plants, and a fresh instance of this was brought under my notice at the Show before mentioned. I was informed that three plants received under the name of

E. amethystinum from three different nurserymen have all proved to be distinct plants.

Equally useful for cutting for winter decoration are some of the *Statice*s, which are in most instances remarkably graceful. The well known *S. latifolia* is one of the best of the hardy sorts, but we all like variety, and a very pretty little species which has flowered with me this year for the first time has proved so useful for the rockery that it deserves a note to itself. This little Sea Lavender I received under the name of *S. Dodarti*, and I have no reason to doubt the correctness of the name, although no description of the plant is to be found in any of our standard works. I am not, however, absolutely certain as to the spelling of the name, as I have seen it given as *Dodardti*. However this may be, it is very neat and pretty with its deep green Daisy-like small leaves and erect heads of lavender blue flowers with white calyces. It is thriving well in sandy soil on a rockery with an eastern exposure, but judging from its appearance it would be very suitable for the front row of the border. It is exactly 9 inches in height with me. I have no information as to its native habitat or date of introduction, and should be glad to have any information on these points. There is a yellow flowered *Statice* in cultivation under the name of *S. Fortunei* which would appear to be well worth growing. I had at one time a young plant of this, but it disappeared in a mysterious way, and I was thus deprived of the pleasure of seeing it in flower. It requires a light sandy soil. Those interested in this species will find an illustration of *S. Fortunei* in Maund's "Botanic Garden." I should be glad to know of any place in this country where this Sea Lavender is grown.

Last autumn, in the course of some remarks on the *Verbascums* or Mulleins, I mentioned a fine white-flowered one I had seen in a garden near me, and which had been obtained under the name of *V. variegatum*. I have, through the kindness of the owner of the garden in which I saw it, obtained a plant, which has flowered well this season; and lately I submitted a small piece to the Rev. C. Wolley Dod, who takes a great interest in the Mulleins, and who is thoroughly conversant with the genus. He has very kindly written me to say that the plant is *V. nigrum* var. *album*, the white variety of a native plant which is common in the South of England. This *Verbascum* is one which deserves to be more widely grown. It is a true perennial, flowers for a long period, and produces a handsome spike of white flowers, resembling, in some respects, the white forms of *V. phoeniceum*, but superior in many ways. The individual flowers are smaller, but are much more numerous, of better form and more lasting. The spike, which is over 3 feet in length, is very attractive, and altogether this Mullein is well worthy of recommendation.

But once more, there are too many flowers in bloom to notice further, and with the wind howling in token of a coming storm, and the tall Sunflowers and Asters swaying wildly I draw these notes to a close, feeling that, though autumn brings with it the forebodings of darksome days, there is still the silver lining to the cloud, which cheers us and gives us much present delight.

—S. ARNOTT.

LELIO CATTLEYA ARNOLDIANA.

THE hybrid *Lælia* which was raised by Messrs. Sander & Co. of St. Albans from *Lælia purpurata*, fertilised with the pollen of *Cattleya Mossiæ*, and named *Arnoldiana*, has, says "Garden and Forest," flowered in the collection of Mr. Hicks Arnold. The plant justifies all that was said in its praise when it was awarded a medal and a first-class certificate rather more than a year ago at a meeting of the Royal Horticultural Society in London. Mr. Arnold's plant carried eleven flowers, and they showed the good qualities of both parents, especially in the richness of their colouring, from the pale purple of the petals and sepals to the brilliant dark crimson of the lip.

CATTLEYA SCHILLERIANA LOWI.

MESSRS. HUGH LOW & Co. exhibited a beautiful and interesting form of *Cattleya Schilleriana* named *Lowi* at the meeting of the Royal Horticultural Society on July 26th. The variety, which fig. 26 represents, has large flowers, exhibiting much distinctness of colouring. The sepals and petals are green, and are thickly furnished with brown spots. The lip is pale purple streaked with white. The throat is tinged with yellow. The plant shown

exhibited a similar habit to that of the species, and bore two flowers. A first-class certificate was awarded. It is a pleasing and desirable form.

RAISING ORCHIDS FROM SEED.

"L'ORCHOPHILE" has an article on the raising of Orchids from seed, containing some speculations of much interest in addition to practical information. The raising of Orchids from seed tends, it

FIG. 26.—CATTLEYA SCHILLERIANA LOWI.

says, to pass from the domain of the exceptional to that of the practical. At the present time, perhaps, there does not exist one collection in twenty where some seedling Orchids are not met with. It would be a mistake to consider that crossing Orchids, obtaining seed, securing their germination, and raising the young plants are easy; but the number of attempts has multiplied so greatly that it is natural the results worthy of note should have increased in the same proportion. Much has been said about the intervention of insects in the fertilisation of Orchids, and of the crossing of different species by their movements. It is probable, certain if you like; but it is a question that gives rise to many reflections. The plants which can fertilise themselves naturally, which are visited by thousands of insects, rarely give hybrids, and those which cannot fertilise themselves give them frequently. I know that it is difficult to struggle against a fact, but it is not easy to explain it. It may be said that the ease with which plants fertilise themselves is in itself an obstacle to hybridisation, that all the flowers visited by insects were fertilised before the visit. It is possible, but it is not certain.

Certain Orchids grow side by side; it is thus in our own and tropical countries; they are visited by the same insects; it would be natural to expect that the crosses would be much more common than they really are. I presume that there must be frequent checks, judging by the results of the crosses which we make under glass, where the chances of success are greater and more numerous. Generally the seeds which we obtain are not fertile; this happens forty times in 100. Fertilisation appears to have taken place, the flowers wither, the ovary swells, the pod forms, but the seeds are not fertile; there are all the manifestations of fertilisation without any results. But, it may be objected, able operators raise Orchids from seed very easily. That explains itself thus: Experienced operators secure a greater number of successful "fertilisations" than novices, but they only sow the seeds which the magnifying glass has enabled them to recognise as good. Notwithstanding the attenuated character of Orchid seeds their weight is generally considerable, and it is that which explains the localisation of the species. Take a pinch of Orchid seed, a pinch that may contain several thousands, throw it in the air, and a part, the dust, will sink slowly, be lifted by the wind, and float in the air; the good seeds alone will fall at once to the ground. I do not believe in Orchid seeds being carried to great distances; when the pod is ripe and

opens the seeds fall around the plant, where they germinate in quantity, and the young plants often stifle themselves. If a particular variety is found in a meadow search around without going away, and you will very probably find other examples of the same variety that the weight of the seeds has prevented becoming more widely spread.

In a natural state, if crossing between different species were frequent, there would only be hybrid Orchids on the ground, for it must not be forgotten that all hybrid Orchids are more vigorous than the plants which have produced them, and they would not be long before they took the place of their parents. But this is not the case; the artificial crossing effected by insects is very rare. The numerous fertile seeds in a state of nature might be expected to germinate easily, but the proportion of plants which escape the risks attending them in a young state would be very small. It is in view of the dangers to which young plants are exposed that Nature has provided certain plants with thousands of seeds.

In cultivation great attention is paid to the compost which is suitable for the seedlings; in our opinion the best is that of the mother plant. It should not be forgotten, however, that the seedlings require a more constant humidity than the mother plant, and that they also require a regular rest. It is often forgotten that Orchids are bulbous plants, of a special form it is true, but which rest the same as Tulips, Hyacinths, and other underground bulbs. You would try vainly to make young Hyacinths grow all the year. When the time has come for them to rest, the leaves turn yellow, and the part of the plant above the soil disappears. I feel convinced that if Orchid seeds were sown at the time when the plants from which they issued commenced growth greater success would be achieved, while if they were rested at the proper time more of the seedlings would be preserved.

JUDGING HERBACEOUS FLOWERS.

THE misinterpretation of conditions, and the subsequent disappointment thereby occasioned, are things that will of a surety continue so long as loosely worded classes are to be found in schedules. These latter are framed by the Committee, too often in indefinite terms, without any note having reference to a particular class or classes whereby the exhibitor may be guided; but exhibitors as a rule are sufficiently intelligent to know for themselves what is really intended, and if the wording is beyond their powers of comprehension nothing could be simpler than putting the question to the Secretary, and he would bring the subject before the Committee, who would no doubt be able to clearly interpret the meaning they intended certain words should convey.

A schedule should not be a puzzle, and should be discussed thoroughly before going finally to press and then to the public. Where the wording is not sufficiently clear the exhibitor places his own construction upon the class, and this on the show day may be found not to tally with the idea of the committee, who have given their instructions to the judges. These gentlemen are sometimes told to use "their discretion," and again "not to be too hard or exacting;" but I maintain that if the judges pass by errors unnoticed it affords the exhibitors every opportunity of deviating and assuming this or that. I do not say disqualify unconditionally at all times, though perhaps this means, if severe, would be the best in the long run; but I do say this, that every erring exhibit or such as is likely to be in the first three should be branded, and the reason briefly stated on the card; or the exhibit may be disqualified, and if sufficiently meritorious be awarded a special or "consolation" prize. Such a step would demonstrate on behalf of the Committee that the terms of the schedule must be complied with, while a special award would also display their leniency and sympathy with the erring exhibitor.

As regards "herbaceous flowers," some exhibitors appear to think anything will do for these, especially when we see in prominent London exhibitions such things as Tree Pæonies included and passed by without comment, securing a place of honour into the bargain. I have never seen H.P. Roses in pots included as "herbaceous," though they have just as much right there as Tree Pæonies. Then, again, both annuals and biennials very frequently are set up as herbaceous, though quite erroneously. "Northants" speaks of Stocks and Zinnias, but neither of these is "herbaceous," and would merit disqualification, an herbaceous plant being one that "produces annual flowering stems from a perennial root." Such a one may be quite hardy or may require the temperature of a stove or greenhouse, provided it performs the above functions; therefore a class for herbaceous plants or flowers as usually intended should be rendered "hardy herbaceous" to be definite and unmistakable. Their relative or comparative hardiness is of little moment, because societies for these exhibits are common now in

most towns and many villages, and competitors are confined to a given limit as a rule; therefore Kent and Durham would hardly be competitors, while in larger exhibitions classes are framed for the immediate district of the society, and "open" classes for all comers.

With a more careful wording of the schedule much might be done where a thoroughly practical man is secretary, backed by a practical executive; but what may be expected in those instances where a pensioned policeman or a schoolmaster with no knowledge of gardening or plants obtain, and where the executive are the various shopkeepers of the place, and who are quite ignorant of the subject before them?—J. H. E.

WEM.

PROBABLY no shorter heading has ever appeared to an article in the *Journal of Horticulture* than the above. If it had not been for certain Sweet Peas bringing the little name to the front some readers might have wondered what Wem could be; but they have learned that it is not a plant but a geographical expression. It is the name of an ancient looking village some ten miles from Shrewsbury, and the home of certain Peas—some to gratify the eye and render gardens and rooms beautiful and sweet; others to satisfy the palate—all raised by that diligent florist and experienced gardener, Mr. Henry Eckford. His Sweet Peas in their season of flowering are a sight to see, and the long rows of culinary varieties laden with huge pods are not likely to be soon forgotten by those visitors who, to perpetuate a perhaps just admissible alliteration, wend their way to Wem. Many do this not from various parts of this country only, but from the Continent and America; it is the Sweet Peas mainly that attract them.

Mr. Eckford has worked so perseveringly in improving these charming fragrant garden flowers that he may almost be said to have revolutionised them. The advances, however, have been made step by step, a few new colours and a slight increase in the size of the flowers having been obtained each year, so that we have to contrast the varieties of a generation ago with the new ones up to date to fully appreciate the change that has been brought about by the skill of the hybridiser and the selections of the florist. It is easy enough to raise new Peas, at least by those who know how; but the work is not half done then, and rejection, retention, and fixation may be the work of years before pure and distinct stocks are established.

Mr. Eckford has, at an estimate, about 3 acres of Sweet Peas at Wem, and 2 acres of culinary varieties; but these are of the newer varieties only, some of the latest in commerce, with others to follow, and the bulk of his seed is raised elsewhere, where better harvests are obtained than in their cold native parish. Peas grow luxuriantly at Wem, and flower profusely, the Sweet Peas apparently right into the autumn. They are grown in rows 5 or 6 feet apart, with Potatoes between them, of which Mr. Eckford's favourite early variety is Sharpe's Victor, because he finds it the first ready for digging, and one of the best for use. The Peas occupy the same ground year after year, without any loss of vigour; but it is possible their seeding may be prejudiced by the abstraction of potash, one of the chief essentials for a good harvest of seed. When a plant shows an improvement in its flowers, as is the case here and there in most of the rows, it is carefully bent from the row and secured to a stake, while any that may fall below the standard of merit are drawn out altogether. The rows, however, are singularly true, and the long lines of colour, from white through various tints of rose and pink to glowing carmine, from pale lilac through different hues of lilac and mauve to purplish black, have, when in full beauty, a delightful effect, and the air is laden with perfume.

Mr. Brotherston wrote very agreeably and usefully on Sweet Peas last week (page 161), and directed attention to several undoubtedly good varieties. He will grow them again no doubt, and if he is a connoisseur, and wishes to have the latest and the best, let him try such of the following as may strike his fancy, and describe his experience with them another season. They were among the best of the thirty-six varieties staged at the Shrewsbury Show, but looked quite as well in the rows as in those attractive bunches:—Emily Eckford: This closely approaches a true blue, the wings being of a well-marked cerulean tint, but the standard suffused with reddish mauve. Peach Blossom: An extremely pleasing colour, the wings being soft rose shaded with cerise, the standard rosy red at the base, shading upward to pale pink. Ovid: One of the most richly coloured varieties yet raised, being brilliant rosy carmine. Royal Robin: A clear pink, with blush wings and a white keel. Venus: A blush coloured flower, with a suffusion of pale yellow, very distinct. Stanley: A beautiful dark flower, standard and wings being very dark brownish purple, almost

black. *Blushing Beauty*: Soft pink, suffused with lilac, a distinct and lovely variety. *Lady Penzance*: Beautiful lustrous rose. The prevailing colours are given, and the flowers are large, smooth, and may be described in somewhat jingling phraseology as some of the gems of Wem.

Among culinary Peas Mr. Eckford has raised several very fine varieties by systematic crossing. With the view to obtain high quality he chose *Ne Plus Ultra* and *British Queen* for his base of operations; and with quality he seeks productiveness. To secure retention a variety must produce its pods in pairs, "singles," no matter how fine, meeting with prompt rejection. In use during the Shrewsbury Show week or the last half of August were the following—*Ambassador*, 5 to 6 feet, laden with immense pods packed with *Ne Plus Ultra*-like Peas, and therefore of the first quality. As a dwarf sturdy grower *Superabundance* stood out prominently, the fine pods being borne in such profusion as to justify the name, if anything would, and the peas tender and buttery. Intermediate between these two in altitude, 3 to 4 feet, but not inferior in any respect, was *Colossus*, a suggestive name and not inappropriate. These are three very fine Peas, as are the four to follow, presumably next year—namely, *Censor*, 2½ to 3 feet, with large, full, dark green pods; *Copious*, 2½ feet, a mass of splendid pods; *Heroine*, 3 feet, robust, dark green, several pods containing ten peas; and *Wem*, 5 to 6 feet, bearing from top to bottom. It is lighter in colour than *Ne Plus Ultra*, but in other respects possesses the same characteristics, plus larger, square-ended, heavier pods. This, with *Censor* and *Heroine*, have received the highest number of marks in the Chiswick trials this year, perhaps the greatest ordeal through which Peas have to pass.

It will be perceived that good work is being done on the outskirts of the primitive looking Shropshire village, with its laconic name; and as many gardens have been enriched already so will many more be in the future, through the skill and industry of a genuine British gardener, aided by his attentive and industrious son, who evidently means to uphold the reputation of the name he bears. Thirty-five years have come and gone since I first met the elder Mr. Eckford—a midnight meeting in a Mushroom house that he well remembers—and I am glad in having had the privilege to "tak a cup o' kindness" with him in these latter days of his busy life, now being happily spent among the Peas at Wem.—
AULD LANG SYNE.

ENGLISH ARBORICULTURAL SOCIETY.

THE above Society held their annual excursion on Wednesday and Thursday week in Yorkshire. The Society two years ago visited the West Riding of Yorkshire, which was a most pleasant excursion, and the venue this time was changed to the East Riding, Duncombe Park and Castle Howard, the seats of the Earls of Faversham and Carlisle respectively, being visited.

The party travelling from the North left Newcastle by a special saloon carriage, which the North-Eastern Company placed on most reasonable terms at their disposal, journeying to Helmsley, where they were met by the southern members. After an early breakfast on Wednesday morning the party started to inspect the home nurseries of the Earl of Faversham at Duncombe Park, Mr. Havelock, the head forester, being their guide. The nurseries are over 5½ acres in extent, and include over 1,000,000 million of seedling plants of Sycamore, Elms, Spruce, and Corsican Pines. Mr. Havelock finds it a great advantage to grow many of the forest trees, as greater facilities occur in the planting. The work can be done more expeditiously, and with less certainty of failure, as the plants can be lifted when required. Near to the entrance gates was a very fine Oak tree containing about 220 cubic feet. It was 10 feet 3 inches in girth 5 feet above the ground, and 75 feet in spread of branches. There was also another fine Oak 135 cubic feet, and 8 feet in girth.

HELMSLEY CASTLE.

The party then visited the above Castle, which is a very old and ancient structure, and was evidently well defended. There are two moats, and a formidable drawbridge with portcullis entrance. The walls were 17 feet 6 inches thick. It was demolished in 1644 by Cromwell. Some portions had fallen down, and yet remain like huge boulders, showing the character of the cement or lime used in those days. On one portion, supposed to be the chapel, was growing profusely in wild luxuriance on the top of the wall the *Viper's Bugloss*. The Castle once belonged to the Duke of Buckingham (whose state apartments were inspected) before being bought by the present noble owner's ancestors.

The kitchen gardens were next inspected. They consist of about 4½ acres. The range of grass is at the entrance. There were six vineries 36 feet long; the Vines were healthy, productive, and bearing excellent table Grapes. The first vinery entered was all late Grapes, including *Black Alicante* and *Lady Downe's*, which were finely finished. The head gardener, Mr. David Williams is able to keep them up to May. In the other houses *Muscat of Alexandria*, *Pearson's*

Golden Queen, which was very good, and *Black Hamburg* constituted the principal varieties. In a cold house was a fine batch of *Poinsettia pulcherrima* with healthy dark foliage. There were fine *Peacheries* and *Fig houses*, all in fruit-bearing condition, and yielding excellent testimony to Mr. Williams' skill as a practical gardener. In the kitchen garden were *Callas* and *Spiræas* planted out in trenches for forcing when required.

DUNCOMBE PARK.

Duncombe Park is now in course of construction, it having been burnt down in 1879. Near to the terrace there are to be seen some very old Oaks, very much forked and supposed to have been planted over 800 years. There are also Sycamores, Oaks and Chestnuts, all in various stages of growth, that have been planted by the members of the noble owner's house as they have been married. There are also memento trees by the Prince of Wales and the late Prince Albert Victor, which were planted in 1887, the former having planted *Picea nobilis* and the latter *Acer pseudo-platanus purpureus* and *Cedrus Libani*. The home terrace is very fine. It is very level and well kept, the grass being short and velvety in texture. At each end there is a temple, one in the Ionic and the other in the Tuscan style. There is also a quaint old sundial. The mansion was built in 1718, and is in the Doric style, by Sir John Vanbrugh. Close to it is a very fine Beech tree, the stem clean and straight; its quarter girth is 25½ inches, and it contains over 200 cubic feet. This tree received much admiration from the Society. There was a still finer Beech of 37½ quarter girth. Some splendid Yews were also inspected, averaging 7 to 8 feet in girth 5 feet from the ground.

At the south end of the home terrace, before approaching the Tuscan terrace, there are two fine views. On the right is Helmsley Castle; on the other side a fine cascade of water, falling impetuously down amongst the rugged boulders. These views were much appreciated, the sylvan foliage being of every hue, and the height above the River Rye, with its winding and tortuous course, made the whole scene sublimely impressive. To the south, close to the Tuscan Temple, is a good view of the plantations of Duncombe Park. Mr. Havelock has 6000 acres under his charge. These woods are horseshoe in shape and about sixteen miles in length, extending from Helmsley Bridge to Riccal Bridge. The mansion is built in the centre on an elevated plateau, where the scenery from all parts is enchanting. Near to the Nelson Gates is a fine avenue of Beeches. A curious old Lime was observed, which is supposed to have been planted 300 years. It had the appearance of having two stems, which by some cause had been divided. These are bound by huge chains, and the trunks are literally covered for over 30 feet with *Polypodium vulgare*.

The party then entered the carriages, and after a sharp drive through the park, where several fine groups of fallow deer were seen, the Home Farm was reached. It is a model one in every respect. The fine bull, "New Year's Gift," four years old, purchased from the Queen's sale at Windsor last spring for 1000 guineas, was inspected. His fine proportions gave the party much pleasure; his weight is 25 cwt.

RIEVAULX ABBEY.

This fine Abbey was built in 1128. St. Bernard, Abbot of Clareval in France, and founder of the Cistercian Brotherhood, sent some monks over to the King, who received them kindly, and the grand old warrior, Walter l'Espece, granted them his protection, gave them the ground to build the present Abbey, and liberally endowed it. The Abbey was designed by one of the monks, William, the first Abbot; it is a lasting monument to the learning and skill of the monks of that age. The magnificent terrace of Rievaulx is over half a mile in length, and from every point a splendid view of the Abbey is seen. It is perfectly lovely, and stands some considerable height above the river, so as to overlook the ruins of the Abbey which was dismantled 300 years ago. This terrace was planted by Sir Thomas Duncombe in 1758 to commemorate the finishing of the estate. It is almost impossible to describe its beauty. Mr. Havelock has exercised great skill in cutting out views at every angle so as to see the beauties of the dale and the far-off Hambleton Hills. From here the party drove to Carlton Woods, where some fine Larch and Austrian Pine were inspected, and this ended the first day's excursion.

About fifty members sat down to dinner at the Black Swan Inn, Helmsley, Mr. James Watt, Carlisle, Vice-President, in the chair, and Mr. Beadon and Mr. Bernard Cowan in the vice-chairs. After the usual loyal toasts, that of the Society and also of the Scotch Society, had been drunk, the officers were elected, including Lord Masham as President, Mr. Ross, Swinton, Masham, presented the Society with a dendrometer for measuring trees, which is his own invention. It is a very ingenious instrument. The Society accepted the gift, and it is hoped it will form the nucleus of a museum, which has long been in contemplation.

The party was astir early on Thursday, and in the carriages by 9 A.M., when a move was made to the Fox Covert Plantation belonging to the Earl of Faversham. This has been a very fine plantation, one of the most successful in Yorkshire. On the 19 acres there were 1945 trees, including 1327 Larches. The Larch were about 80 years' growth. They averaged 38 1-6th cubic feet, and one remaining as a sample measured 23¼ inches in quarter girth, and contained 135 cubic feet. From here the party had a sharp walk through the Golden Square Plantation, entered their carriages, and then made a slight halt at Hoveringham, where, by the permission of Sir W. C. Worsley, a fine Scotch Fir was inspected, 300 feet high, and 33 inches quarter girth. There was also in the village a Horse Chestnut 13 feet in girth.

CASTLE HOWARD.

Entering the carriages a quick drive brought the party to Castle Howard. Thortle Woods were first inspected, where the company was received by Conrad Dillon, Esq., brother to the Countess of Carlisle; Mr. Fell, head forester; and all the leading officials of the estate. The woods are remarkable for the Spanish Chestnuts they contain. They equal those planted a good deal further south. Their success is attributed to their being interplanted with Oaks, which gave the necessary shelter. A fine Larch plantation planted twenty-three years after the Oaks was most successful and free from disease. The Society was then shown some successful "Ball planting" (the Forster's technical name), which was much commented on by the experts of the Society. The result has been most satisfactory, and it may be stated that this estate of over 1800 acres could have never been so ably managed otherwise, as it was entirely overrun with rabbits. The trees have been shifted from five to eight years old. They consist of Larch, Oak, Chestnut, Beech, and Spruce. At this age the trees are valueless after thinning from a commercial point of view, but when shifted with good "balls," although the expense of planting is great, the trees are soon equal to those in the quarters they have been transplanted from. The north and south Bell Bottom Woods contain some very fine Oaks. Comhagg Woods is a further proof of "Ball" planting, which has been exceedingly successful, especially with Larch and Beech, done two years ago. In this wood was a splendid Oak, a remnant of the old forest, containing 262 cubic feet, and 34 inches quarter girth; it was valued at about £32 10s. There is also here a fine Oak plantation planted after Oak about twenty years ago doing well.

The party, at the invitation of the Earl of Carlisle, then proceeded to the Castle to luncheon, which was held in the Grecian Hall. The Hon. Conrad Dillon presided, supported by Vice-Presidents Coroner Graham, J. Watt, and Wm. Fell. The chair was also supported by the Hon. Geoffrey Howard, the Hon. Michael Howard, the Hon. Misses Dillon, and the Hon. Arthur Dillon. After a superb repast Mr. Coroner Graham moved a vote of thanks, which was responded to by the Hon. Conrad Dillon in the absence of the Earl of Carlisle. The party then, under the guidance of Mr. Dillon and the ladies mentioned, viewed the Castle, which contains a marvellous collection of pictures, old china, and cut glass, after which a hurried move was made to the gardens, where, under the guidance of Mr. J. Riddle, the head gardener, every object of horticultural interest was pointed out. On emerging at the south entrance an Italian flower garden was inspected, in the centre of which is a very fine fountain with statuary. The kitchen gardens are most extensive, and contain an excellent collection of herbaceous plants. In a border was also a marvellous display of Carnations, together with Shirley and Iceland Poppies. In the vineries Gros Colman, Black Alicante, Pearson's Golden Queen, and Foster's Seedling were the principal Grapes grown, and were of much cultural merit. In one of the vineries was a Fuchsia named Mrs. Marshall, more than 5 feet through, only fifteen months old. There are large stoves and ferneries. At the cool end of the latter was a fine specimen plant of *Bougainvillea glabra*. In the stoves *Eranthemum Andersonianum* was in flower, and there were some fine plants of *Stanhopea oculatus*. There is also a fine conservatory 65 by 65 feet, which is also adapted as a vinery, and will rank as one of the largest in England. Space does not permit of more being said about these gardens, but under the judicious management of Mr. Riddle no one in this neighbourhood ought to miss an opportunity of visiting them, as much of an interesting, educational, and instructive character in gardening will be found.

I append a few historical reminiscences of the Howard family. The present distinguished owner is directly descended from Sir Walter Scott's Belted Will of Romanco, or Lord William Howard. The latter was the second son of the fourth Duke of Norfolk. This remarkable family have had twenty peerages conferred upon them in 400 years. Lord Howard is immortalised as the Lord Warden of the Marches betwixt England and Scotland. He was an intrepid commander, and was the fear and terror of unlawful marauders in the district. Sir Walter Scott says:—

"His Bilboa blade by Marchmen felt
Hung in a broad and studded belt,
Hence in rude phrase the borderers still
Call noble Howard 'Belted Will,'"

However, the learned Dr. Lonsdale, M.D., in his admirable biography of the Howard family, thinks that it referred to Baldrick or Broad Belt, worn in that day by persons of high position; Belted Will, in his opinion, meaning Bauld or Bold Willie, as it is proved that his belt was very small and unassuming. Belted Will was born on December 19th, 1563, and died October 9th, 1646. He was married October 28th, 1577, to Lady Elizabeth Dacre. It was this union that brought northern estates into the possession of the Carlisle family. There is a fine obelisk, erected 100 feet high by the third Earl of Carlisle in commemoration of the planting of the grounds with trees and the finishing of the buildings, the inspection of which afforded the party much instruction and pleasure. Mr. Fell, the forester, was complimented on the condition the woods were found in. After a hurried look at Slingsby Castle the party joined the saloon carriage at the Slingsby Station, and set out for their respective destinations, all highly pleased with the enjoyable and instructive visit they had had. It adds another pleasant recollection to the annual meetings of the English Arboricultural Society.

There was a large number of members present, including Mr. Jas. Watt, Carlisle; Mr. Coroner Graham and Mr. Wm. Fell, Vice-Presidents;

and Messrs. J. F. Robinson, Burnopfield; W. Scott, Burnopfield; Wm. Forbes, Masham; Geo. Cooper, Gateshead; Jos. Graham (Chairman of the South Shields and Westoe Burial Board) South Shields; F. W. Beadon, Huddersfield; John Balden, jun., Assistant Secretary, Hexham; Fröken Marsh, South Shields; Fröken Silven, lady botanist from Wallinska; S. Rolan, Stockholm, Sweden; Thos. Vasey, Master Thos. Vasey, James Muir Smith, Capt. Davidson, Ed. Lincoln, Bernard Cowan, and Master John Joseph Moran, South Shields; J. R. Brown, J. W. Robson, W. B. Havelock, Helmsley; A. Ross, Skipton; Councillor Thornton and Hebden Barker, South Shields; C. Lonsdale, Carlisle; G. Gallie, Ravensworth; and R. S. Balden, Hanging Heaton. The party were much pleased with the able way in which Mr. J. Balden escorted them in the unavoidable absence of the Secretary, Mr. J. Davidson.—BERNARD COWAN.

OAKLEY HALL, BASINGSTOKE.

DOUBTLESS many passengers by the South-Western Railway, riding from Basingstoke towards Winchester, have noticed that the line cuts, as it were, a big slice from off a pretty park a few miles below the former town. That is the park attached to Oakley Hall. The entrance, however, is found nearly a mile across on the other side, and within fifteen minutes' walk from the Oakley station on the Salisbury line, which branches out from the main line not far above. The park and mansion are not old. The trees, which are largely of Beech and very handsome, are perhaps 100 years planted, perhaps less; but the house is a comparatively modern erection, almost entirely of red brick, a somewhat bold Elizabethan style, and is reached from the entrance lodge in about half a mile through a gentle ascent. The entrance side of the house is enclosed by a bold balustrading, having entrance and exit on either side. The object of this enclosure is not evident, but it is not at all an objectionable feature. That side of the house is well covered with evergreen climbers, but the garden front is quite bare. That seems a pity, but the owner, Wm. Beach, Esq., M.P., or rather his lady, objects to such coverings. It is right to say that just at present the house and gardens are in the occupation of W. P. Gilchrist, Esq., a London merchant.

The grounds were laid out by the elder Milner some years since, and exhibit many features that render them pleasing as well as interesting. The peculiarity of the situation of the mansion is that it stands on rising ground, so that on its garden side, to secure a level flower garden, it was found needful to excavate one from the elevated ground, and thus the flower garden is on its outer margins surrounded by sharp slopes, which increase in depth the further it recedes from the house. To the onlooker this is rather an advantage, as from the upper lawn a capital view of what is a beautiful parterre flower garden is obtained. Immediately fronting the house are two fine carpet beds, but beyond all the parterre is planted with the best forms of bedding plants in rich profusion of colouring, with studied balance and effect. The pretty Begonias Princess Beatrice and Afterglow make charming masses, blooming most profusely. Phlox Drummondii, Marguerites, Fuchsias, Heliotropes, Begonias, and Pelargoniums all have places, and Mr. Weaver merits high praise for his beautiful combinations. In addition to the beds there are dotted at regular distances very fine and handsome specimen Irish Yews, Golden Hollies, and Portugal Laurels.

On the right side of the mansion, joined to it by a glass corridor filled with climbing Roses, Palms, &c., runs out at right angles a noble conservatory in three divisions. The first is a fernery representing natural rockwork, done in Pulham's best style. This is delightfully dressed with choice Ferns planted in the rockwork, including *Adiantum gracillimum*, *concinnum*, and *dolatum* *Legrandi*, very interesting with its fronds composed of close setting tiers of foliage; *amabile*, *cuneatum* *grandiceps*, and many other choice varieties; some good Tree Ferns also adorn the rockwork. This place would make a beautiful picture. The centre division has on the floor a large fountain, with Water Lilies in the base, whilst fine Tree Ferns stand round, and plants of various descriptions ornament the sides. The roof is in the form of a lofty dome, and is draped with the variegated *Cobœa scandens*. The third division is chiefly furnished with fine Ferns and Palms, of which there are numerous large specimens, and on the roof hangs a truly superbly coloured *Bougainvillea glabra*, the racemes of flowers or bracts hanging down in rich profusion. On the other hand, *Bougainvillea spectabilis* cannot be induced to bloom at all, though growing robustly. From the mansion and beyond the flower garden the rising lawn is very finely dressed with large numbers of handsome Coniferae, fine trees and shrubs, the centre figure of the remote lawn being a large group of Conifers, which creates two fine grassy glades that run away insensibly into the park.

At the extremity of one of these, but hidden by trees, is the gardener's cottage; to the right are the kitchen gardens, and away in the distance is an ancient enclosure where there are many notable features. First is a sort of court or quadrangle, of perhaps an acre in extent, entirely enclosed by a wall, and Yew trees some 40 feet high. In the centre is a grand Beech with a circumference round the branches of about 220 feet, and as sort of sentinels there is at each corner a very fine *Taxodium sempervirens*, perfect specimens and of great height. An opening at one side exhibits a vista of turf, walled in on either side by gigantic Box trees. These are literally woods of some 30 to 40 feet in height, and wonderful to see. Probably there is hardly to be found in the kingdom so fine a Box tree grove as is this. Beyond this runs an avenue of fine Chinese Junipers, backed by numerous Conifers. *Picea Nordmanniana*

is close by coning grandly, driven to do so perhaps because of the shallowness of the soil and the contiguity of the chalk. About the grounds *Cedrus atlantica*, *Wellingtonia gigantea*, *Thuia Lobbi*, *Lawsoniana*, and *gigantea* furnish numerous splendid specimens. Beyond the grove to which I have referred the ground rises to its greatest height and presents a noble site for a mansion, overlooking the park in all directions, and commanding glimpses of the remote country and the main line of the railway in the foreground. Turning to the kitchen gardens these are found to be first enclosed by a tall Yew hedge planted by Mr. Milner, although for what reason is not obvious. This is on the upper side of a sloping border employed for the growth of vegetables; then comes a broad footpath, then a narrow border and within all the garden wall. Outside this hedge and on the southern side is a number of glass houses devoted to plants and fruits, also numerous frames; standing about these now indispensable plant adjuncts are many fine *Chrysanthemums*, and everything is excellent and well cared for.

surface soil. Raspberries do badly, only old local sorts thrive. Black Currants do badly also, except Carter's Prolific, which does very well. The only good Strawberries for the soil are Héricart de Thury and Sir Joseph Paxton. Curiously enough Seakale from root cuttings is first class. Mr. Weaver mentions that by sowing his various seeds after being damped and mixed with red lead his beds are never interfered with by birds. The entire place is admirably kept, and well repays a visit at any time.—A. D.

A LITTLE-GROWN PERENNIAL.

TRICYRTIS HIRTA.

THIS attractive herbaceous plant, although well known in many large collections, is by no means in general cultivation, and is in fact quite new to many persons. The annexed engraving (fig. 27)

FIG. 27.—TRICYRTIS HIRTA.

The chief fruit range, however, is in the kitchen garden, where there are growing capital Grapes, Figs, Peaches, &c., Grapes especially were excellent, really good crops of good useful bunches. A few years since Muscat of Alexandria took to shanking. Mr. Weaver, therefore, took out all the soil of the inside border, carefully lifted the roots, tied them up for two days, remade the border, and relaid the roots, started the Vines in the month of February, giving a gentle warmth, and secured the same season an excellent crop. He has not been troubled with shanking since. Gros Maroc Grape is good, so are Lady Downe's and West's St. Peter's. Dempsey's Alicante is here later, and has much smaller berries than Meredith's Alicante. The latter variety grafted on Barbarossa is fully a month later than on its own roots. Foster's Seedling, Buckland Sweetwater, and Black Hamburg Grapes, are also well done. Negro Largo Fig, that was formerly gross and barren, was made very fertile by having the border in which it is growing greatly reduced by a brick wall.

The kitchen garden is good and prettily interspersed with flower borders. Vegetables do finely. Celery, Onions, Lettuces, Peas, and Potatoes are all good crops. Apples are very fair, but the best Pear trees are those on the Pear stock, whilst trees on the Quince do badly, the leafage turning yellow. The roots seem to prefer the chalk subsoil to the

represents very fairly the clusters of flowers, which rise from the axils of the leaves on the upper part of the stems. The latter usually reach a height of 3 to 4 feet, and bear numerous sessile, clasping, hairy, alternate leaves. The flowers are white, thickly dotted with purple, the divisions of the perianth being slightly recurved. The plant is hardy, and will thrive extremely well in a sheltered border composed of sandy loam and peat; but as the flowers appear late in the season, the leaves are often by that time shrivelled, and present a very unsatisfactory appearance. For this reason the plant seems to be best suited for pot culture, and it is well adapted for growing in a greenhouse or any structure of a similar temperature. The flowers also are seen to much greater advantage when near to the eye than if the plant occupies a border, where the fine markings of the sepals are quite lost. It can scarcely be imagined what pretty little buttonholes the flowers make when mounted, and they are also well suited for bouquets. During the time the plant is growing freely and until the flowers are produced abundant supplies of water will be required, but after the flowers have faded water must be given in smaller

quantities, only sufficient to keep the soil slightly moist. The pots must be thoroughly drained, and the soil employed should consist of loam, sand, peat, and a small proportion of leaf soil may be added.

This species of *Tricyrtis* was originally named by Thunberg *Uvularia hirta*, but since Mr. Fortune rediscovered the plant in Japan, and sent specimens to Mr. Standish of Bagshot, the old generic name has been discarded in favour of the one given above. The name *Tricyrtis*, we may remark, is derived from two Greek words, and refers to the three sac-like convexities at the base of the outer divisions of the perianth.

EVENTS OF THE WEEK.—The show list is not so heavy this week, but there are one or two important exhibitions to be held. To-day (Thursday, September 1st) the Royal Oxfordshire Horticultural Society's Show takes place at Oxford. On Friday and Saturday, September 2nd and 3rd, the National Dahlia Society's Exhibition is to be held at the Crystal Palace. On Tuesday, September 6th, the Committees of the Royal Horticultural Society will sit at the Drill Hall, Westminster. On Wednesday and Thursday, September 7th and 8th, the National Chrysanthemum Society will have a Show of early Chrysanthemums, Dahlias, Gladioli, and vegetables at the Royal Aquarium, Westminster; and the Exhibition of the Royal Caledonian Horticultural Society will take place on the same day.

THE WEATHER IN LONDON.—The weather during the past week has been of a variable character. The 27th was signalised by a rain of almost tropical heaviness, which continued until the morning of the 28th. Some particulars of it are given in another paragraph. Subsequently the weather has been in the main fine, but broken by occasional heavy showers. At the time of going to press strong westerly and south-westerly winds are blowing. The weather is bright, and the glass firm.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Society will take place in the Drill Hall on Tuesday, September 6th, at 3 P.M. A paper on "Root Pruning" will be read by Mr. Geo. Bunyard, and ought to evoke some discussion among amateurs. The Council have offered substantial prizes to the best grown varieties of Gladioli, to be competed for on the occasion, as have also Messrs. Kelway for the best British raised forms of *Gladiolus gandavensis*.

HAMPTON HORTICULTURAL CO., LIMITED.—This Company was registered on the 25th ult., with a capital of £3800, divided into 760 shares of £5 each, to carry on in Great Britain, Ireland, and elsewhere the trade or business of florists, nurserymen, farmers, and gardeners, or merchants of flowers, fruit, vegetables, &c. Registered by Nash & Co., 12, Queen Street, London, E.C.

NEW HEAD GARDENER AT ROOD ASHTON.—Mr. A. Miller, gardener for the last sixteen years to W. H. Long, Esq., Rood Ashton, Trowbridge, is leaving that place, and it is to be hoped so good a gardener will not long be disengaged. Mr. Miller will be succeeded by Mr. W. Strugnell, gardener to A. R. Baily, Esq., Frome, and formerly foreman under Mr. W. Iggulden in the gardens, Marston House.

GARDENING APPOINTMENTS.—Mr. Samuel Reece, for the past thirteen years gardener to Robert Whyte, Esq., Pentland House, Lee, and under whose care the yellow Arum Lily (*Calla pentlandiense*) first grew and flowered in this country, has been appointed gardener to W. J. Jarratt, Esq., Hatton House, Westgate-on-Sea, Isle of Thanet. Mr. Walter Taylor, late of Wimbledon House, has been appointed head gardener to A. T. C. Cartwright, Esq., Edgeote Park, Banbury, Oxon.

IMPROVEMENT IN BARLEY.—At Messrs. Carter & Co.'s experimental farm at Bromley several important experiments have been made for the improvement of Barley, more particularly in the matter of strength of straw and robustness of plant, so that it can better resist exceptional climatic influence in the form of wind, rain, or hailstorms. It is confidently anticipated that some valuable progress will result from Messrs. Carter's labours in this direction.

PEACHES.—I send a sample of Peaches, Princess of Wales. The crop is, on an average, one fruit to each $7\frac{1}{2}$ square inches. Some were a shade larger and some a shade smaller than the sample. The tree, which is indoors, bears a similar crop annually.—S. SCOTT, *The Gardens, Rathmore, Belfast*. [The fruit was 10 inches in circumference, very good for a heavy crop, and of excellent quality.]

RAMONDIA PYRENAICA.—I find that this alpine succeeds best in a compost of peat and loam, the former predominating. Planted in the ordinary soil of the rockery the plants hardly grew at all for several years, although shaded, and certainly never flowered; but since moving them to a north aspect, where a stone slightly overhangs them, and employing a compost as described, I get on tolerably well with them.—E. M.

BARON SCHRÖDER.—An impression appears to have gained ground that a baronetcy has been conferred on Baron Schröder, of The Dell, Egham, and some may have thought the *Journal* a little behind the times in not having an announcement to that effect last week. We were all right in the matter. There are two Baron Schröders, and it is not the Baron of horticultural fame who has been caught in the shower of honours attending the change of Government, but his brother at Liverpool.

EALING GARDENERS' ASSOCIATION.—The annual outing of this useful body took place on the 25th ult. by the kind permission of T. McMeekin, Esq., at his charming place, Falkland Park, South Norwood, a description of which was given in these columns recently. The extensive alterations and improvements, which are being so ably carried out by his gardener, Mr. A. Wright, proved a source of much interest and instruction to the visitors, who unanimously expressed their approval.

THE POTATO DISEASE REPORTED SPREADING.—The Potato blight is said to be extending in the Ashford district and on the borders of the Weald of Kent. It has also made its appearance at Oxted and other parts of Surrey. "The Potato disease is spreading to some extent in the neighbourhood of Liverpool," writes "R. P. R." I never remember the tubers turning up in finer quality or in greater abundance than this year. The heavy rains, and the murky, oppressive atmosphere, are doing a great deal to help forward the disease, this being apparent in the haulms of most varieties."

ASPARAGUS DEFLEXUS.—I saw in your issue of last week that the above beautiful Asparagus had received a first-class certificate. I am not at all surprised at that, after seeing it for the first time, a little more than a week ago, at Knowsley Hall. Mr. Harrison, Lord Derby's esteemed gardener, has planted it alternately with *A. plumosus*, and intends it to cover the back wall of a house occupied with cool Orchids and Ferns. It was doing remarkably well, and in bringing it to my notice Mr. Harrison stated the very high opinion he had formed of it for decorative purposes. That it is a plant which will be more extensively grown no one, after once seeing it, can for a moment doubt.—R. P. R.

DISQUALIFYING EXHIBITS—FRUIT AND VEGETABLES.—I was amused after reading "R. C.'s" remarks on this subject. Whoever disqualified a collection of vegetables because it contained Beetroot ought never to judge again. With regard to Cucumbers and Tomatoes, I maintain that they should be included in all collections of vegetables. The way to know what is a fruit is to ask oneself, What is right for a dessert table? Then we know that a Melon is really a fruit, and that Cucumbers and Tomatoes are for the bread and cheese. Perhaps some one might give Tomatoes, Cucumbers, and Marrows some special name or class if necessary.—A. J. L., *Reading*.

HOLLYHOCKS FROM THE NORTH.—I have much pleasure in sending you blooms of my seedling Hollyhock John Cairns for inspection, together with a few other exhibition varieties. It is pleasing to relate that the fungus has not made its appearance in any of the gardens I have visited this season, and it is to be hoped we shall not be troubled again with this pest. It is obvious that when a little care is taken with the old stools in the autumn there is not much trouble in keeping the plants clean the following year, and there is no greater pleasure than to be able to look upon a well-grown collection of Hollyhocks.—GEO. STEEL, *Heatherslaw, Cornhill-on-Tweed*. [The flowers Mr. Steel sends are magnificent, and remind us of their quality in years gone by. Grace Darling, rose; John Cairns, pale yellow suffused with rose; Queen of Yellow, primrose; and Purple Prince, deep purplish crimson, are superb.]

— **WOODBIDGE HORTICULTURAL SOCIETY.**—We are pleased to find that the excellent summer Show of this Society was a financial success. Captain R. J. Carthew has offered his grounds for the floral fête next year, which is fixed for July 13th. Mr. John Andrews is the efficient Secretary of the Society, and works zealously for its success.

— **HOLLYHOCKS FROM WEST DULWICH.**—Double Hollyhocks have still an active supporter left in the West Dulwich grower, Mr. Smith, who annually calls at the *Journal* office with a box of choice blooms. His last visit was on August 25th, and the flowers he brought were excellent in type, being finely formed, full, and substantial. The colours varied greatly, rose, pink, crimson, lemon, cream, and others being represented. The blooms served as a pleasant reminder of old times.

— **SCORTON HORTICULTURAL SHOW.**—The second annual Exhibition in connection with the Scorton and District Floral and Horticultural Society was held on Monday in the New Institute at Scorton, and was a great success. There were over 100 exhibitors. Mr. T. Lawson of Ellerton made close upon fifty entries, and won numerous prizes in the different departments. A prominent feature of the Exhibition was a magnificent display of Roses sent by Messrs. R. Mack of the North of England Rose Nurseries.

— **TORQUAY DISTRICT GARDENERS' ASSOCIATION.**—It is always a pleasure to wish success to an organisation having the welfare and progress of horticulture as its main object, and as the Torquay District Gardeners' Association comes into existence with this end specially in view it merits recognition and encouragement. That it fills a want would appear to be evident from the fact of nearly 100 members having already joined; may its numbers continue to grow. W. H. Lavers, Esq., has been elected President, and Mr. Fred. C. Smale, 1, Knowsley, Avenue Road, Torquay, Hon. Secretary.

— **LYNTON HORTICULTURAL SHOW.**—This Society held its eleventh annual Show on the pretty Manor Ground, Lynmouth, kindly placed at the disposal of the Committee by Mr. C. B. Jeun. The weather proved most auspicious, and this, together with the interest which the inhabitants and visitors to the twin towns take in this annual Show, drew a large attendance. The Society has never been in the fortunate position of being able to enter upon a year with a balance in hand, but this year's Show will probably usher in a new era financially, there being a large attendance. The whole of the classes were well filled.

— **ELECTRICITY IN MARKET GARDENING.**—Several years ago the interest of horticulturists and gardeners was drawn to the electric light as a substitute for, or valuable adjunct to, sunlight in forcing plants. We heard at the time of Strawberries and other fruits ripened by electricity, but few people gave any credence to the story, and those who did were mostly deterred from making further experiments in this direction on account of the expense entailed. This difficulty appears to have been overcome in America, for at Boston a Mr. Rawson has, it is said, successfully cultivated and is cultivating large crops of vegetables by electric lamplight. He has covered in several fields with glass. The electric light is used only at night, and the effect in forcing the growth of Lettuces and similar vegetables is said to be extraordinary. This opens up a wide field for the horticulturist, and we may expect in due time to have many kinds of fruit and vegetables that are now restricted to particular seasons, except at prohibitive prices, available all the year round.

— **MARKET REFORM.**—The "National Observer" has come to the rescue of the small grower, and calls attention to the anomalous position he occupies with respect to the commission agent, who charges so much per punnet or bushel sold instead of a per-centage on the gross amount realised. Under this condition of affairs it does not matter what the price realised may be, good or bad, his commission is the same. But our contemporary goes on to comment on a still more significant fact—namely, that agents are very often dealers in what they sell on commission, and even growers or producers of the articles which they sell on behalf of others. What this opens the gate for is obvious. "What is affirmed—and that with emphasis"—says the "National Observer," "is that, if there be such a thing as a wicked salesman, he may sell another man's goods to himself at the cheapest and resell them to the public at the dearest rate without breaking any Commandment openly, or showing a vulnerable point to

the law; and that if the London market system be not rotten to the core, it can only be because all salesmen whatsoever are so very noble and virtuous that not the connivance of the law, nor the unprotected condition of their customers, nor even the love of profit, may tempt them out of the path of rectitude and the way of honour. But many ugly stories are current among their customers, and of late unpleasant facts have come to light." No doubt the system has been abused by unprincipled men, but there is no lack of salesmen who act with the greatest fairness, and give full satisfaction to the growers of garden produce with whom they deal.

— **CROTONS AT DOVER HOUSE, ROEHAMPTON.**—"J. B." writes:—"In the well-kept gardens of Dover House, Roehampton, I noticed recently a wonderfully fine collection of Crotons, some fifty-six varieties, very brightly, indeed unusually well, coloured, and forming a capital display of these useful decorative plants. Noteworthy were Reedi, Cronstadt, Chelsoni, volutum, Lord Chelmsford, aigburthensis, Mrs. Norman, superbum, Countess, and Prince and Princess of Wales. Mr. J. F. McLeod, the able gardener, is to be congratulated on his culture of these plants. Chrysanthemums (some 1500 plants) and Carnations in thousands, with other well-grown classes of plants, also attest to his skill as a cultivator."

— **TELEKIA SPECIOSISSIMA.**—Probably few visitors at Rede Hall on Wednesday week saw the fine plant of this grand hardy perennial there, and which is certainly so rare that it is seldom met with. Mr. Cottle drew aside a few Conifer branches in one part of the grounds, and there, revelling in the shade and seclusion, was a fine specimen carrying several stems some 4 feet in height, and producing very large single yellow flowers fully 4 inches across; the petals are thread-like, resembling those of a fine-petalled single Japanese Chrysanthemum. The variety evidently likes shade and seclusion. It is not mentioned in the select lists of hardy perennials published in the report of the proceedings of the Royal Horticultural Society of November, 1891, that includes almost every known good hardy plant.—D.

— **PHLOX AVALANCHE.**—I do not know whether this variety of the herbaceous section is new or not, but I learn from Messrs. Collins and Gabriel's foreman at Hampton that it had not been certificated. Certainly there are few varieties more worthy that honour. It carries fine trusses of large flat pips of pure white colour, the individual blooms being larger than a pennypiece, and forms one of the best white hardy flowers for pots or borders I have seen. In the Hampton Nursery it is grown in considerable quantity. The heads are on stems 20 inches in height, on second-year bottoms, and on spring-struck cuttings it would be some 6 inches shorter. What a fine thing for any form of plant decoration would be a large quantity of such dwarf plants in pots, carrying single heads! I commend it to all lovers of the Phlox very heartily.—A. D.

— **ALLOTMENT ASSOCIATION.**—I have a recollection of reading some long time ago an account of the forming and working of an Allotment Association, by which means the holders procured seeds, &c., also disposed of part of their produce to advantage. My employer has recently cut up a 10-acre field in addition to others already existing, cottagers holding 10 or 20 rods, one or two others who keep a cow having an acre. Our c'ergyman and myself are interested in the matter, and wish to encourage it. We think that by the holders combining more life and energy will be thrown into the work. If any of your readers can assist us with useful hints, or give us the address of a secretary of an association that is working successfully, I shall feel greatly obliged.—GEO. NOTTAGE, *Gardener to J. Bonham Carter, Esq., Adhurst, St. Mary, Petersfield.*

— **RAWMARSH AND PARKGATE FLOWER SHOW.**—The annual Show of the Society formed for the promotion of gardening pursuits in the Rawmarsh and Parkgate district took place on August 16th. The Rawmarsh Cricket Club had kindly lent their field, which was in every way well adapted for the event. Financially the Society is in a fairly good position, the accounts for 1891 exhibiting a substantial balance in the bank after discharging all liabilities. The proceedings were largely attended, and there is no doubt that the gate money will compare most favourably with that of any previous local undertaking of this description. The prize money amounted to £50, and for the most part the competition was keen. There were two sections—amateurs' and cottagers'—each being well represented in pretty nearly all sections. Vegetables were excellent, and several good collections of fruit were staged. Plants in pots were fully up to former years, while amongst the

cut flowers were several exceptionally fine blooms. For Roses the season has been a good one, and the display, though not large, was exceedingly creditable.

— **HOW STOLEN FRUIT WAS STORED.**—Three schoolboys, William Harden, Charles Blackwell, and William Whicker, were charged on remand at the Hampstead Police Court with stealing from a garden sixty-five Pears, value 1s. 6d. They were seen in the garden, and a constable was called in. When caught Whicker pretended to faint. Blackwell and Whicker had stowed the Pears away in the legs of their trousers, having previously tied the bottoms of the legs with string. Prisoners were fined 2s. 6d. each, the bench expressing the hope that the parents would inflict proper chastisement.

— **LATE STRAWBERRIES**—Having lately been able to pick about every other day a dish of bright, good-flavoured Strawberries from early forced plants of my favourite variety, Vicomtesse Héricart de Thury, and as it came about by a very simple mode of treatment, I thought it worth recording. When the plants were removed from the forcing houses they were placed under a north wall, and kept well watered, with the result that they threw up abundance of green leaves and flower trusses. They were then placed on the low shelves of a late Peach house, and treated as pot Strawberries usually are, and are at the present time a useful addition to the dessert.—R. MAHER, *Tattenodon Court, Newbury.*

— **AN ENEMY IN FLEET STREET.**—Fleet Street and neighbourhood, says the "City Press," have been visited of late by a plague in the form of mosquitoes. In some of the offices they appear in swarms, and cause infinite annoyance to the unoffending occupants, who are savagely bitten in unprotected parts of the body. Large lumps are raised, and irritation is set up, which sometimes lasts for more than a week. They are a small kind of mosquito, but are quite as troublesome as the Australian breed. They move about with marvellous celerity, and have a curious knack of making themselves invisible. The theory is that these little tormentors have been imported from Algeria with the esparto grass from which paper is made, and have come from the paper mills to London. They have not appeared at the *Journal* office yet, possibly having scented the stacks of insecticides awaiting trial there.

— **A HEAVY RAINFALL.**—There was an exceedingly heavy rainfall in London on Saturday, August 27th. It commenced soon after 1 P.M., and continued with little intermission until about 9 A.M. on the morning of the 28th, the rain falling in torrents during a great part of the time. In some places 1½ inch was registered, in others as much as 1¾ inch, marking it as one of the heaviest falls for the time of year on record. Writing to one of the daily papers from Canonbury, which is in the North of London, Mr. J. Spiller stated that the total fall amounted to 1.83 inch in the twenty-four hours, and we have to go back to August 1st, 1888, to find its equal. On that date exactly the same amount was registered. The wettest day of last year (August 20th) fell short of this by half an inch, and on comparison with previous returns it is found that the total rain during the months of August, 1889 and 1890 (1.86 and 1.91 respectively) exceeded by very little the amount that fell on this one day.

— **BRIGHTON SHOW.**—Through the indefatigable exertions of Mr. Mark Longhurst and the Committee, the "new" Society has gained an unassailable position in a very short time. It is supported equally by practical horticulturists and influential patrons of horticulture. It will give an idea of the scope of the Summer Show to mention that there were about 700 competitive entries, besides a large number not for competition, and that in one class there were as many as twenty-four entries, with fifteen to eighteen in several others. One of the most remarkable features of the Exhibition were the magnificent specimens staged by Mr. Offer, gardener to J. Warren, Esq., Handcross Park, Crawley, which easily won the first prize (£10) in the class for twelve stove and greenhouse plants. They were of huge dimensions and in robust health. Mr. Jupp of Eastbourne also showed well in the class for six, and was placed first. Groups were a splendid feature, that arranged by Mr. Peel, Southampton, in a space of 100 square feet, being extremely beautiful, and securing the premier position. Fruit was a large and good display. Mr. Reynolds, gardener to Messrs. de Rothschild, Gunnersbury Park, won with a collection, staging some excellent produce, and he showed prominently in other classes. We hope to be able to report as favourably of the financial result of the Exhibition as we are in a position to do of its general quality.

— **KIDNEY BEANS AT CHISWICK.**—The numerous varieties of Kidney Beans on trial were examined on Tuesday last. Among the white flowered varieties Carter's Jubilee was awarded three marks of merit, The Czar and Giant White two marks. Hill's Prize, Veitch's Giant, and Sutton's Prizewinner Scarlet Runners were granted three marks, and Giant Titan and Invincible two marks. Among the French Runners, Hungarian Butter, Mont d'Or, Flageolet Wax, and Sutton's Tender and True received three marks. They were tender and delicious when cooked, the last named being remarkable for its long pods and productiveness. Empress Frederick received two marks. In the Dutch case knife section Fillbasket was the only noteworthy variety, and was granted three marks of merit.

— **PEAS AT READING.**—Having heard of the exhaustive trials of Peas being made by Messrs. Sutton & Sons, and as early and late Peas are a speciality of mine I had a wish to see their trials of early and late varieties. On application I was cordially invited to inspect them. All types and forms were well represented at their trial grounds, varying in height from 6 inches to 6 feet, suitable alike to amateur suburban gardeners with whom sticks are not obtainable or desirable, and to landed proprietors with whom Pea sticks, long and plentiful, are to be had. In the latter case tall Peas are to be preferred. Taking a broad view of the minute and painstaking trials the advance in the dwarf section was truly remarkable, varieties being observable with large well filled pods of fine Marrowfat flavour. Medium height and tall varieties were all well represented, comprising the best in commerce grown alongside of the firm's seedlings and introductions. Very conspicuous were Perfection Marrow and Exhibition Marrow, in height about 3 feet 6 inches to 4 feet, having fine long dark green pods in great abundance.—R. M.

— **APPLE STEALING AND ITS SEQUEL.**—At the Guisborough Police Court on Tuesday week, John Morgan, Frank Thompson, Walter Jackson, Ernest Burt, Chas. W. Bougham, John Abbott, and Wm. Harris, all of North Skelton, were charged with stealing Apples the property of Jno. A. Lince, gardener, Saltburn, on the 10th ult. Mr. Richardson prosecuted. Bougham, Jackson, and Morgan were each ordered to pay 10s. each and the others 7s. 6d. each. John A. Lince was charged with unlawfully shooting at John Morgan. Mr. Richardson defended. Complainant stated that he, in company with the other defendants in the previous case, walked towards Lince's garden. Complainant got over the hedge, and was half way across the beck, when he heard someone talking. He turned, and had just got back over the hedge into the field, when he heard the report of a gun, and felt that he was shot in both legs and one arm. He looked round and saw defendant with a gun in his hand. Complainant admitted that he had gone to the garden with the intention of stealing Apples. Mr. Richardson submitted that defendant did not shoot with intent to do any harm, but simply with a view to frightening depredators away. Defendant was committed for trial at the Sessions.

— **PICOTEES FROM MR. BEN SIMONITE.**—Our old Sheffield friend writes:—"I have sent for your inspection a box of my seedling Yellow and Fancy Picotees. I think them fine border flowers; they are very vigorous growers. What is your opinion of them?" We think they are very fine indeed, the majority being large, well-formed flowers, with very broad smooth petals, the only fault of some being a tendency to pod-splitting, but others were good in this respect also. A brief note of each is added. Duchess of Portland is a splendid variety, having a stout stem, perfect calyx, and flowers of great size, the petals very broad, substantial, and evenly disposed; it is a yellow ground, edged and lightly feathered with mauve. Sybil, yellow ground flecked with red, a large flower with broad stout petals. Orion, yellow ground, flaked on the edges with crimson—a noble flower. Kate, yellow ground feathered with rosy lilac, very smooth, broad petal. Ophir, lemon ground, lightly flecked with red, good petals. Mrs. Field, cream ground, heavily edged with deep rose, very broad petals, evenly folded. Mrs. Simonite, yellow self. Frisel, white ground, heavily edged with deep rosy crimson. Sylph, lemon ground, lightly flaked with rosy red, broad, smooth petal—a flower of great beauty. Ganymede, yellow ground, with a few flecks of crimson. Modesty, canary ground, with medium rosy pink edge—a charming flower. Brilliant, white ground, heavily edged with rich rosy red, broad, very stout petals, evenly disposed—a bright and effective variety. Sylvia, bright yellow ground, edged and flaked with rosy crimson, broad, well-rounded petal; and Ellen, lemon ground, edged and flaked purplish rose, very broad petals and strong calyx. All things considered they are an excellent type of flower.

— THE PRODUCTION OF TEA, COFFEE, AND COCOA.—At a meeting of the London Chamber of Commerce on Monday, July 25th, Mr. J. Ferguson read a paper on "The Production and Consumption of Tea, Coffee, Cacao (Cocoa), Cinchona, Cocoa-nuts and Oil, and Cinnamon, with reference to Tropical Agriculture in Ceylon." He referred to the position of Ceylon, its forcing climate, its command of free cheap labour, and its immunity from the hurricanes which periodically devastated Mauritius, from the cyclones of the Bay of Bengal, and from the volcanic disturbances affecting Java and the Eastern Archipelago. The plantations of Ceylon afforded, he said, the best training in the world for young men in the cultivation and preparation

lands and which were already in danger of being over-produced, and he had arrived at the conclusion that Coffee, Cacao, and rubber-yielding trees were the products to plant, while Tea, Cinnamon, Cardamoms, Cinchona bark, Pepper, and even Palms (for their oil) did not offer encouragement to extended cultivation.—(*Nature*.)

BEGONIA MARIE LOUISE.

AMONGST the novelties exhibited at Chiswick, on the occasion of the Begonia Conference, was a very handsome Begonia of the Rex type, named Marie Louise. It was placed before the Floral Committee last

FIG. 28.—BEGONIA MARIE LOUISE.

of tropical products, and in the management of free coloured labour. The cultivation of Cane Sugar, although tried at considerable outlay on several plantations forty and fifty years ago, now proved a failure. More recently experiments by European planters with Tobacco had not been a success, notwithstanding that the natives grew a good deal of a coarse quality for their own use. Although cotton growing had not been successful, the island had proved a most congenial home for many useful Palms, more particularly the Coco-nut (spelt without the "a" to distinguish it and its products from Cocoa—the beans of the shrub *Theobroma cacao*) and Palmyra, as also the Areca and Kitul or Jaggery Palms. Within the past few years Ceylon had come to the front as one of the three great Tea-producing countries in the world, India and China being the other two, with Java at a respectable distance. Mr. Ferguson said one of the chief objects of his paper was to demonstrate which of the products of the island it was safe to recommend for extended cultivation in new

year by Messrs. J. Veitch & Sons; but as a desire was expressed to see whether it would retain its dwarf character another year it was held over and produced again on the present occasion, when the Committee, being fully satisfied of its dwarfness, awarded it a first-class certificate. Although very little is known of its parentage or whence it emanated, it is thought to be a hybrid, possibly of continental origin. It averages about 6 inches in height, and is remarkably handsome. The foliage is heart-shaped, bright glossy green, with a broad bronzy patch near the base, across which run veins of a silvery flesh colour. The surface of the leaf is covered with silvery blotches. The edge is of the same bronze hue as the patch referred to, and is thickly studded with silvery dots, as shown in fig. 28, which represents it. A point that should be mentioned in favour of the plant, apart from its dwarf growth, is the way it retains its colour, a feature that is exhibited by both old and young leaves.

NOTES ON WATERING.

WATER is so indispensable to the existence of plants that a clear understanding of the relation of water to plant life would, I think, be of service to inexperienced persons. It is an operation in daily practice at all seasons, and one which requires much judgment and care. The time when water is likely to be needed should, if possible, be ascertained in the morning, so as to avoid having to apply any more than is absolutely necessary during sunshine in the middle and hottest part of the day. Soft rain water is always the best for plants of every description, therefore provision should be made to collect as much as possible from the roofs of glass houses and other structures.

Water should never be applied to plants at a lower temperature than that in which the plants are growing, particularly to plants that are being subjected to severe forcing. Plants in pots should be examined every day, particularly those in small receptacles, as they get dry quicker and suffer sooner than those in larger pots; but while care must be taken not to let them get too dry, equally as much care must also be taken not to make them too wet by watering them when they do not require it, or the soil will become sour and the plant assume a sickly appearance. In watering plants a great mistake is often made by giving them a little every day, thereby keeping the surface soil wet, while that below becomes quite dry, and the roots being principally at the bottom of the soil the plant quickly begins to wither away through want of moisture. If a plant has become very dry, as is sometimes the case through being overlooked, the soil will be found to have contracted, leaving a crevice between it and the pot, so that when water is poured into the pot it very quickly runs out again; in this case it does the plant little good, for instead of penetrating the ball it goes between the pot and the soil, only wetting the soil nearest the top. To well moisten the ball it should be placed in a vessel containing tepid water as deep as the pot, and allowed to remain ten or fifteen minutes.

In summer, of course, plants will require more water than in winter, but they must always have it when they are getting dry at whatever time of the year it may be. In winter it is generally desirable to have the foliage of most plants dry at night; watering is therefore best done in the morning, not that it is always necessary to wet the foliage, but because of the waste having time to evaporate. A wet soil is totally unfit for plant-growing. A Hyacinth it is true will live one season in water, but all the matter which goes to make up the flower is prepared the year before, and after flowering the bulb is exhausted and almost worthless; therefore a good soil for plant-growing is not one which will hold water, but one from which water will rapidly pass away. If it were water simply which plants required we might with advantage cork up the hole in the bottom of the flower pots and prevent the water from escaping. Instead of this we try to hasten the passing of the water through as much as possible, by not only keeping the aperture as clear as possible, but by putting pieces of potsherds over it. How often to water will be according to how readily the water passes away; if, when water is poured into the pot, it disappears almost instantaneously, it would be safe to water the plants every day.

In the above notes on watering I have only spoken in somewhat general terms, as there are individual plants which require special treatment in regard to moisture; for instance, as a rule, softwooded plants and those of quick growth require more water than those of a slow-growing or hardwooded nature, therefore the amount of water and the frequency of its application are matters which can only be known from personal experience in dealing with the various classes of plants under cultivation, some requiring it in summer two or three times a day, while others would be ruined if they were similarly treated.—GEORGE PARRANT, *Ashby Lodge Gardens, Rugby.*

HORTICULTURAL SHOWS.

NEWCASTLE-ON-TYNE.—AUGUST 24TH, 25TH, AND 26TH.

ON the back of the schedule of the Durham, Northumberland, and Newcastle-on-Tyne Incorporated Botanical and Horticultural Society it is stated that it is the oldest in England, having commenced in 1824, and being now, therefore, sixty-eight years old. It would be interesting to know if any Society has ever buffeted storms and misfortunes in an equal degree to this one. Its history is unique as a record of disasters. It was conducted in a very small way prior to 1874, but after that energetic management of the most thoughtful and businesslike kind soon raised it to high rank and position in the horticultural world. A series of rainy seasons subsequently considerably militated against the progress of the Society, but last year a more serious catastrophe still was in store, for the whole of the marquees were blown down by a hurricane. The

disaster was serious, but the Committee and their energetic Secretary, Mr. Jas. J. Gillespie, were equal to the occasion. An appeal was made to the public, and a magnificent concert was arranged, with the result that the debt was paid off, and a substantial balance left to carry on the Show another year.

A good prize schedule was arranged this year, and with the favourable weather that prevailed the Society have scored another great success. In every respect the Exhibition was a grand one. The fruit was excellent. Table decorations were never seen better at Newcastle, and they were considered by many competent to form an opinion the best of the kind held in England. Roses were also a special feature, and the whole Exhibition was most satisfactory to the promoters. The Society offer £270, which is competed for in three sections: A, open to all; B, open to gentlemen's gardeners; and C, open to amateurs only.

PLANTS.—In section A, for eight stove and greenhouse plants in bloom, the President offered a cup value 11 guineas, which induced four competitors to come forward; the Society also offered 6 guineas, 4 guineas, and 2 guineas. Mr. Nicholas, gardener to the Earl of Zetland, Uplatham, was first with fresh well grown plants consisting of *Allamandas nobilis* and *grandiflora*, *Ericas æmula* and *ampullacea*, *Bougainvillea glabra*, *Cypripedium Lawrenceanum* with fifty-five blooms, and *Statice profusa*. Mr. Wylam, Shank House, Cramlington, Northumberland, was second, his *Stephanotis floribunda* and *Clerodendron Balfourianum* being very fine. Mr. John McIntyre, gardener to Mrs. G. Pease, Woodside, Darlington, was third with a fine *Eucharis amazonica* and *Anthurium Andreanum*. For eight foliage plants there was only one competitor, also for six Ferns. In both classes first prizes were given to Mr. J. McIntyre for specimens that the strongest competition secured would have had a hard struggle to defeat. In the foliage plants Mr. McIntyre exhibited well coloured *Croton angustifolium*, *Cycas revoluta*, *Areca Baueri*, *Phoenix rupicola*, and *Dicksonia antarctica*. The Ferns were of exceptional merit, comprising a fine plant of *Gleichenia Mendeli*, *Davallia Mooreana* over 7 feet through, *Adiantum farleyense*, and *Microlepia hirta veristata*. For four *Ericas* Mr. Nicholas was first with well grown plants of *Marnockiana*, *Aitoniana superba*, and *Ne Plus Ultra*. *Pentstemons*, *Liliums*, and tuberous-rooted *Begonias* were also well shown.

TABLE DECORATIONS.—Table plants are always an interesting collection at Newcastle; three lots were staged and all were meritorious. Mr. J. McIntyre was first with fine *Dracænas*, *Aralias*, *Pandanus Veitchi* and *Cocos Weddelliana*. *Epergnes* were both numerous and good, in fact, as already indicated, formed one of the main exhibits of the Show; perhaps it would be no exaggeration to say that they were the best of the kind exhibited this year. Mr. George Webster, florist, Sunderland, was first with an ornate and graceful arrangement, in which many flowers were brought out to the best advantage. In the top tier were *Francoa ramosa*, *Grasses* and *Orchids*; in the second, *Paneratiums*, *Lilium lancifolium roseum*, white *Lapagerias*, and *Cattleya Mossiæ*; at the base early *Chrysanthemums* were used effectively. The second prize epergne, exhibited by Mr. John Morris, Felling-on-Tyne, was also good. Baskets of cut flowers, which have only recently been exhibited at Newcastle, were very good. Mr. W. R. Armstrong, High Benwell, was first with a neat arrangement; Messrs. Perkins & Sons, Coventry second with a much larger basket, but very effective. Mr. Armstrong was also first for a bridal bouquet, followed by Messrs. Perkins. Hand bouquets were a choice collection, Messrs. Perkins here scoring against the local competitors. Ladies' sprays were also largely shown. Messrs. Perkins were again first with an arrangement that was simple but very effective, white *Roses*, *Jasminum grandiflorum*, *Caladium argyrites* and *Oncidium flexuosum* being all blended effectively. Hand bouquets were in great numbers, containing *Orchids* and many other choice flowers. Eighteen buttonholes were staged, Messrs. Perkins being first with a most graceful arrangement consisting of *Odontoglossum Alexandræ* and *Oncidium flexuosum*, with *Adiantum gracillimum* as a background.

CUT FLOWERS.—For twenty-four Dahlias Mr. N. Walker, Felling, was first with large flowers, and no coarseness in their texture. They included good blooms of James Carter, R. T. Rawlings, Mrs. Gladstone, Earl of Ravensworth, T. W. Girdlestone, J. Walker, George Dickson, Majestic, Queen of the Yellows, and Goldfinder. For twelve Dahlias, Fancies excluded, Mr. George Humphries, nurseryman, Chippenham, was first, Mr. N. Walker second, and Messrs. H. Clark & Son, Rodley, Leeds, third. Pompon and Cactus Dahlias were a very extensive display, and received much admiration from the many visitors attending the Exhibition. For Cactus Dahlias Mr. Geo. Humphries was first; the stand was superb, conspicuous being *Delicatissima*, nearly heliotrope in colour. Hollyhocks were represented by five lots. Mr. Humphries was also first here; much pleasure was expressed by the visitors that these flowers were again coming forward. For eighteen spikes of *Gladioli* Messrs. Harkness & Sons, Bedale, were first for large, fresh flowers. The best blooms were *Sceptre de Flore*, *Opal*, *Magnificent*, *Grand Rouge*, *Amalthée*, *Orphée*, *Baroness Burdett Coutts*, and *Meyerbeer*. Most of these averaged ten blooms each. *Roses* were an extraordinarily fine collection, and were never shown better before at Newcastle. Messrs. Harkness & Sons were first. The stand was excellent, and well worthy of premier honours, including fine blooms of A. K. Williams, *Maréchal Niel*, *Alfred Colomb*, Mrs. J. Laing, *Merveille de Lyon*, *Madame Hoste*, *Chas. Lefebvre*, *Marie Baumann*, and *Horace Vernet*. No less than seven stands were staged, and proved a most important feature in the Exhibition. Messrs. Maek & Sons, Catterick, were second with very good flowers. Herbaceous plants were a leading feature, five stands of eighteen kinds of herbaceous flowers being exhibited. Mr. J. G. Roe,

Museum Park, Barnard Castle, was first with an extra good stand; and Messrs. Harkness were second, also with a good collection. In the first collection was staged *L. candidum*, *Lythrum roseum superbum*, *Bocconia cordata*, *Veratrum nigrum*, *Veronica spicata*, *Helianthus japonicus*, *Chelone barbata*, *Gaillardia multiflora*, *Lilium chalcidonicum*, *Chrysanthemum Golden Queen*, and *Stenactis speciosa*.

Asters, Picotees, and Carnations were shown in goodly numbers, also Show and Fancy Pansies. For twelve bunches of stove and greenhouse flowers Mr. F. Nicholas was first, showing *Oncidium flexuosum*, *Amaryllis Holfordi*, *Lapageria alba*, *Dipladenia amabilis*, *Stephanotis floribunda*, *Cypripedium Harrisii*, *Clerodendron fallax*, *Eucharis amazonica*, and *Disa grandiflora*.

FRUIT.—For a collection of twelve dishes of fruit the Society offered £7 and the Royal Horticultural Society's silver Banksian medal. Mr. J. Hunter, gardener to the Earl of Durham, Lambton Castle, was first with a superior and faultless collection. Gros Maroc and Muscat of Alexandria Grapes were well finished and coloured. Royal George Peach, Baroness Rothschild Pine Apple, Brown Turkey Fig, White Magnum Bonum Plums, Chaumontel Pear, and Lord Napier Nectarines were also good. Mr. James Tullett, gardener to Lord Barnard, Raby Castle, was second with a very good collection, including Smooth Cayenne Pine, Muscat of Alexandria and Black Hamburgh Grapes, Dymond Peach, Pineapple Nectarines, and Williams' Bon Chrétien Pear. Mr. J. McIntyre was third, his Madresfield Court Grapes and Duchesse d'Angoulême Pears being good.

For eight dishes Mr. J. Hunter was also first. In this collection Gros Maroc and Muscat of Alexandria Grapes were exhibited with Best of All Melons, Prince of Wales Peach, and Worcester Pearmain Apples. He was followed by Mr. Tullett and Mr. McIntyre. For four dishes, Pines included, Mr. Tullett was deservedly first, his Black Hamburgh Grapes being good, also the Peaches, Nectarines, and Melon. Mr. Joseph Atkinson, gardener to Sir Edward Blackett, Matfen Hall, was second, his Black Hamburgh Grapes being very good indeed. For six bunches of Grapes, not less than three varieties, Mr. John Potter, gardener to W. P. Moore, Esq., Whitchall, Mealsgate, Carlisle, was first, including typical bunches of Muscat of Alexandria, Madresfield Court, and Black Alicante. Mr. Potter was also successful for two bunches of Black Hamburgh and for two bunches of Black Alicante Grapes, the latter being well finished. Mr. J. Hunter showed also in this class, but the Judges thought they were Madresfield Court, but Mr. Hunter has grown and exhibited them for twenty-five years; it is special culture they receive at Mr. Hunter's hands that makes them look so. For two bunches of black Grapes, any other sort, Mr. Joseph Atkinson was first. For white Muscats and Buckland Sweetwater he was again first. Mr. Potter was first for the heaviest bunch of Grapes with Trebbiano, weighing 10½ lbs. Eight lots of Melons were staged. Mr. L. Richardson, gardener to Miss Williamson, Whickham Lodge, was first with Holborn Favourite, a well netted, green flesh variety.

Peaches were represented by eight dishes. Mr. F. Nicholas was first with Prince of Wales and Earl's Favourite grown out of doors. Nectarines and Apricots were also exhibited, and good dishes shown. Pears, Apples, and Plums were shown by Mr. Hunter from his orchard, and were much admired for their size and earliness.

In division B, open to all, for six plants, Mr. J. Morris, Felling-on-Tyne, was first, including a good plant of *Ixora Williamsii*, *Stephanotis floribunda*, *Lapageria alba*, *Clerodendron Balfourianum*, *Erica Austiniana*. For foliage plants Mr. F. Nicholas was first, *Crotons angustifolius* and *Williamsii* being well coloured. *Neottopteryx australasica* and *Dicksonia antarctica*, with the Palms *Chamærops Fortunei* and *Kentia Belmoreana*, concluded the lot. Mr. John Spoor and Mr. Brown won the special prizes for Dahlias and Hollyhocks. Table decorations were very good. Messrs. G. Webster, Misses Edmondson and Lawson were the successful prizetakers.

NURSERYMEN'S EXHIBITS.—These were very large and numerous at Newcastle, and added considerably to the attractiveness of the Exhibition. Mr. W. J. Watson, Fenham, Newcastle, showed a good mixed display of plants. Messrs. Wm. Fell & Co., Wentworth Nurseries, Hexham, exhibited a grand stand of Coniferae, which was placed at the entrance of the Exhibition, and received considerable attention from the public. At the opposite end was the display of Messrs. Little & Ballantyne, Carlisle. This was a fine collection of stove and greenhouse plants, Crotons being a special feature. All the above firms received a special diploma from the Society on the recommendation of the Judges. Messrs. Hillar, Darlington, exhibited a miscellaneous stand, with *Bilbergia roseata* in bloom. Messrs. Forbes & Son, Hawick, exhibited florists' flowers, including a new *Viola* named Mrs. Nesbit, bronze yellow in colour. Messrs. Laing & Mather, nurserymen, Kelso, exhibited Carnations Mrs. Reynolds Hole in baskets. The Malmaison section was very fine. Messrs. W. F. Gunn, 3, Stockton Road, Sunderland, exhibited garden requisites. Messrs. Harkness & Son had Roses in grand condition, Mrs. J. Laing being especially fine. Messrs. Jos. Robson and Son, Hexham, had a stand of plants and cut flowers; and Messrs. Stuart and Mein, Kelso, Carnation and Picotees. Miss Armstrong had hand bouquets; Mr. M. Cuthbertson, Rothesay, had a stand of plants; and Mr. Jas. T. Brownlow, 3, Bellevue Terrace, Gateshead, had terra cotta stands and brackets for drawing-rooms.

At the luncheon Mr. J. Baxter Ellis presided, supported by the Mayor, Sheriff, Under-Sheriff, and several Councillors of the city of Newcastle. Especial congratulations were offered to the Secretary (Mr. Gillespie) for his energy and interest in the Society's progress, especially as he is about to enter the Council of Newcastle unopposed.

HORSHAM.—AUGUST 25TH.

THE twenty-first Show of this Society was held in Springfield Meadow, London Road, by kind permission of A. Agate, Esq., on Wednesday. The weather during the early part of the afternoon was rather threatening, and between two and three o'clock several sharp thunder showers came down, but it afterwards cleared up, and in the evening the Show was well patronised. The Show on the whole was very good, though the entries, numbering 1612, were considerably short of last year. The division that will most interest the readers of this Journal is that "open to all England and all classes." There were only two entries for a group of plants, and little difficulty was found in awarding the first prize to Mr. E. Lawrance, gardener to T. Oliver, Esq., Tonbridge; J. Peterson, gardener to Colonel Clifton Brown, Holmsbush, being the other exhibitor. Mr. T. Sparkes, gardener to E. Allcard, Esq., Wimblehurst, was the only exhibitor of four foliage plants. He was also successful in the class for four *Coleus*, four *Caladiums*, a specimen foliage plant, and four *Begonias*, the latter being very good, and like all his exhibits proved the grower to be a man of no mean skill. Mr. W. Lacy, gardener to Mrs. Mortimer, Wigmore Park, was an easy first with four exotic Ferns, also for four stove and greenhouse plants, and he might well be proud of the splendid *Eucharis* with close upon thirty spikes, with which he carried off the prize for a specimen flowering plant.

Of cut flowers there was an excellent display and good competition in the classes for Roses, Dahlias, and Asters. The veteran amateur, Mr. A. Slaughter, Steyning, and Mr. H. Harris, gardener to Mrs. Eversfield, Denne, were well to the fore with Roses, the former winning in the classes for twelve and twenty-four, while the latter had the best twelve, three blooms of each. Mr. J. Morgan took the lead in both classes for Asters; Mr. J. Pullen, gardener to H. H. Walford, St. Leonards Forest, in that for Gladioli and Decorative Dahlias, Mr. T. Sparkes for Show Dahlias, and Mr. W. Sparkes, gardener to F. W. Butler, Esq., Horsham, for singles.

Fruit was fairly well represented, the black Grape, Peach, and Apple classes being well filled. There were four entries for eight dishes. Mr. G. Duncan, gardener to T. C. Lucas, Esq., Warnham Court; Mr. G. Goldsmith, gardener to Sir E. Loder, Leonardslee; and Mr. T. Osman, Chertsey, being placed in the order of their names. For black Grapes Mr. J. Pullen was placed first with fairly heavy well finished Hamburgs, Mr. T. Glen, gardener to Mrs. Montefiore, Worth Park, following with very finely finished Gros Maroc. In the class for white Grapes Mr. J. Colman, gardener to — Henderson, Esq., Sedgwick Park, was first with very fine bunches of Muscats; and it must suffice to say that the following were successful in the other classes:—Peaches, Mr. J. Pullen; Nectarines, Mr. G. Goldsmith; Plums, Mr. W. Stovell; dessert Plums, Mr. T. Sparkes; Cherries, Mr. W. Lacy; dessert Apples, Mr. G. Goldsmith; cooking Apples, Mr. G. Duncan; Melon, Mr. T. M. Le Piley.

Vegetables were of high quality. Mr. T. Sparkes was again placed first for a collection of eight sorts, and also for six varieties of salads, closely followed in both cases by Mr. G. Duncan. The single dishes of vegetables were also well contested, but lack of space forbids further details of a very creditable Show.

There is one thing that is continually a source of difficulty with judges and exhibitors alike in the Potato classes—namely, the showing of those beautiful flat-round varieties in the kidney classes. It would be well if there was a class provided for them; they might be called "Pebbles" for distinction. Sir F. A. Montefiore, Bart., is the esteemed President of the Society, and Mr. R. Gilburd, Secretary.

SANDY (BEDS).—AUGUST 26TH.
